Roads and Trails.—During the war years, 2,500 miles of new roads were constructed or improved in the national forests, exclusive of maintenance work. The new roads were constructed under a wartime program to provide access to mineral deposits or timber stands the products of which were needed for war purposes. This brought the total mileage of roads constructed in the national forests to 67,491 and of trails to 113,282. The total of all funds spent on construction and maintenance of forest roads and trails from the beginning of the national forest system to June 30, 1944, was \$472,468,038, of which \$441,200,294 represents federal funds and the balance, \$31,267,744, co-operative funds furnished by states, counties, and local agencies. At the end of the war, much of the national forest road system was below standard, maintenance work having been largely suspended during the war years.

Hydroelectric Power Permits.—Co-operating with the Federal Power Commission under the Federal Power Act, the Forest Service is supervising the operation of more than 500 federal power permits and licenses.

Fish and Game Protection.—Wildlife populations in the national forests in 1945 were estimated to include about 2,300,000 big game animals and some 3,000,000 fur bearers. National forest wildlife also includes game birds such as grouse, quail, and turkey; and game fish in almost 90,000 miles of fishing streams and in about 1,400,000 million acres of lakes and ponds. Forest officers and co-operating agencies planted 124,000,000 fish in 1943. The total number of deer in national forests at the beginning of 1945 was estimated at 1,940,000, elk 163,000, mountain goats 19,000, bighorn sheep 9,800, moose 8,425, antelope 30,000, black bear 75,000, Alaska brown and grizzly bear 6,000. Within the national forests are 27,733,004 acres in wildlife refuges and sanctuaries; including 405 state game refuges, 30 federal refuges, and 205 areas under special control in the interest of wildlife. The national forests harbor more than a third of the country's total estimated big game population, and provide the nation's largest public hunting areas.

Protection from Insects and Disease.—Control work against white pine blister rust and tree-destroying insects continued on a reduced scale. High school students of predraft age furnished much of the labor for blister rust eradication work in white pine areas of the Northeastern and Lake states and in the western white pine, and in sugar pine regions of the northern Rocky Mountain and Pacific Coast states.

Control work was conducted against pine bark beetles in some parts of the West. There was a severe outbreak of bark beetles in Engleman spruce stands in Colorado, and the salvage of some of the insect-killed spruce was under way. Spruce bud-worm damage was reported to be increasing in the Northeast. The Bureau of Entomology and Plant Quarantine and the Forest Service co-operated in experimental tests with the new insecticide, DDT, for the control of spruce bud-worm and other forest insect pests.

Fire and Fire Control.—Federal and state forestry organizations were handicapped by a depletion in their experienced fire control personnel due to the war. Large numbers of high school students 17 years of age were trained to assist experienced fire guards in the national forests. Volunteer fire fighters provided a reserve of manpower in many areas.

Special wartime hazards and the threat to wartime production, communication and transportation by serious outbreaks of fire made intensified protection effort necessary. Incendiary bombs carried by Japanese balloons were an added hazard in the western states in the early months of 1945. The Forest Service trained some 400 "smoke jumpers" (parachute jumping fire fighters) for prompt attack on fires in inaccessible areas in the West. The Congress appropriated funds for emergency forest fire protection. Danger areas in western national forests were closed to the public in dry weather. With the co-operation of patriotic groups and individuals, federal and state protection agencies continued an intensified forest fire prevention campaign.

According to Forest Service and state reports, a total of 131,229 forest fires burned over 16,549,312 acres of land in the United States in 1944. The damage caused by these fires was placed at \$25,775,312 exclusive of the large intangible and indirect damages to watershed values, recreation and wildlife, and loss of employment which cannot be reckoned in dollars and cents. The number of forest fires in 1944 was 79,000 less than in 1943, and the area burned was only about half that of 1943. This big reduction in acreage loss was attributed by foresters to several factors, including intensified wartime fire prevention effort, improved fire fighting techniques and equipment, and fewer campers and hunters in the woods due to wartime restrictions.

Forest protection forces continued to hold fire losses below average in the first half of 1945. In August and September, however, one of the most disastrous fires of recent years occurred in Tillamook County, Oregon. Thousands of fire fighters were unable to check the spread of the flames.

Co-operation of the Federal Government with the States.—Under the Clarke-McNary Law of 1924, the federal government, through the Forest Service, co-operates with the states and with private landowners in the protection from fire of state and private forest land. Co-operative forest fire protection now extends over 301,228,000 acres in the United States and Hawaii; 129,919,000 acres of private and state-owned forest land, however,

are not yet receiving organized fire protection. Eighty-four per cent of the 1944 fire losses occurred on lands not under protection.

The Clarke-McNary Act also provides for co-operation between the states and the federal government in the production and distribution of forest planting stock for establishing windbreaks and farm woodlands on denuded or barren lands within co-operating states. During 1943, 46,350,500 trees were produced and distributed at low cost to farmers in 42 states and two territories.

With funds allotted under the Co-operative Farm Forestry Act, the Forest Service is now carrying on a forest products marketing service for farm woodland owners, to provide assistance to farmers in estimating their timber volume and value and in harvesting and marketing forest products. By 1945, some 100 projects had been set up, with a farm forester assigned to each. Most of these were conducted in co-operation with the states, on a 50-50 basis.

From 1943 to 1945 the U. S. Forest Service and co-operating state forestry agencies conducted a special program to increase sharply the production of forest products to meet wartime military and essential civilian lumber needs. This Timber Production War Project was of material aid in increasing output of lumber and pulpwood, especially from farm woodlands and small mills in southern, northeastern, and midwestern areas where the bulk of farm woodlands exist.

Community Forests.—Encouraged by the Forest Service, the number of community-owned forests has increased steadily. In 1945 a total of 2,278 community forests was reported, as compared with 1,687 in 1941. The aggregate area was 2,975,550 acres. Local public forests, maintained by counties, municipalities or school districts were encouraged to help solve local problems of unemployment relief, community environment, educational facilities, and health conditions. Memorial forests to commemorate military heroes were being planned in many communities.

Forest Research.—The Forest Service carries on research work at 12 forest experiment stations and at the Forest Products Laboratory, Madison, Wis. Subjects under investigation include measures to increase and perpetuate timber growth, improved methods of forest resource protection and management, and the development of more efficient utilization of wood and other forest products.

Work at the Forest Products Laboratory was concentrated during most of the year on providing research and technical services required for the selection, production, substitution, and efficient use of forest products for war. Research and pilot plant tests on a process for the production of industrial alcohol by the hydrolysis of wood formed the basis for the first commercial plant for the manufacture of industrial alcohol from wood wastes, which was expected to be in operation at Springfield, Oreg., by the end of 1945.

From 1942 to 1945, 15,197 persons representing the armed services and manufacturers received training in technical courses conducted by the Forest Products Laboratory—13,839 in the field of packaging, and 1,358 in aircraft wood inspection and allied courses. The laboratory sent a staff of experts to Europe to conduct training courses for members of the Army Services of Supply charged with packaging vast quantities of war supplies for transshipment from the European to the Pacific War theater.

The Forest Service participated in an organization to gather information on technical and in-

dustrial developments which occurred in Germany during the war years. This information was desired both to aid the United States in the prosecution of the war against Japan and to assist American industry after the war.

Results of research on reseeding depleted western ranges is pointing the way to improvement of large areas of run-down range land. On a 500-acre area reseeded in 1942 in Fishlake National Forest, Utah, grazing capacity was increased from 8 cattle for 4 months to 100 cattle for 4 months. Increase in value of beef produced in the first year of full utilization (1945) was greater than the total cost of reseeding.

Emergency Rubber Project.—Harvesting was started in 1945 on some 32,000 acres planted to guayule under the project for emergency production of natural rubber assigned to the Forest Service in 1942. Nearly all the planting was in California, but additional small plantings were made for experimental purposes in other southwestern states. A new rubber mill was constructed at Bakersfield, Calif., to process the harvested shrub. As the guayule plantings are converted to rubber, the emergency project will be liquidated. The earlier rubber mill at Salinas, Calif., however, will be maintained by the Department of Agriculture for experimental work.

The Forest Situation in the United States.—The United States has 630 million acres of forest land—nearly one-third of its continental area. Of this, 462 million acres is capable of growing timber of commercial quality or quantity. If this forest land were kept reasonably productive, it could easily produce all the timber the nation is likely to need and a surplus for export. But its productivity must be built up and maintained. In order that the supply of wood may be continued from year to year without interruption, a growing stock of timber must be established and maintained so that the volume cut is constantly being replaced by an equivalent volume reaching merchantable size, in places where it can be utilized economically.

The Chief of the Forest Service, in his annual report said that a big job of forest restoration and improvement faces the nation now that the war has ended. Millions of idle acres need planting; many areas of struggling young growth need thinning or other improvement work to increase the quantity and quality of timber yield; watershed areas that contribute to flood danger need special treatment. Such work, he said, will aid in meeting postwar problems of employment, but it is work that should be done in any event as an investment in the country's future. It will build up a resource basis for new industries and permanent jobs.

Forest resources are dwindling not only in the United States but in many other parts of the world. A report of the Interim Commission on Food and Agriculture to the governments of the United Nations in 1945 said that despite the fact that forests can be managed so as to provide ample wood supplies and vastly increased social benefits, only 15 per cent of the world's timberlands are being handled as a renewable and productive resource. It estimated that two-thirds of the world's forests receive neither care nor protection.

CHARLES E. RANDALL,
United States Forest Service.

FORMOSA. An island off the coast of Fukien, China, which was ceded to Japan in 1895 and by the Japanese called TAIWAN. It has an area of 13,890 square miles with a population of

about 5,800,000, of whom 300,000 are Japanese. The highest known sea cliffs in the world, 8,000 feet sheer above the water, are on the east coast of the island. Taihoku (pop. 340,114) is the capital. For Japanese children there were (1937) 143 primary schools with 43,671 pupils, and for the instruction of the natives there were 788 schools with 445,396 pupils. There are also normal schools, a medical school, an industrial school, and a language school. The University of Formosa was established in 1928. The budget for 1938-39 was estimated to balance at 183,014,971 yen. Agricultural products are rice, tea, sugar, sweet potatoes, ramie, jute, and turmeric. Since 1906 the colony has been self-supporting. Camphor and camphor oil exports in 1937 were valued at 1,859,936 yen. Placer gold is worked, and silver, coal, and copper are also found. The industries include flour milling, sugar, tobacco, oil, spirits, ironwork, glass, bricks, and soap. Principal imports are fertilizers, cotton and silk textiles, iron and steel, timber, and automobiles, while exports include sugar, rice, bananas, and tea. Imports for the first 9 months of 1940 totaled 1,176,120,813 yen; and exports 700,848,030 yen. Roads have been built throughout the colony. There were (1937) 646.3 miles of government railways, 316.8 miles of private lines, and 1,246.2 miles which were for the exclusive use of private companies. Post offices numbered 193. There were 217 telegraph offices with 734 line miles. The length of the telephone lines is 2,946 miles. Following victory of the Allies over Japan, Formosa, among other former Chinese possessions conquered by Japan, was returned to China, in accordance with a decision reached by Allied leaders at the Cairo conference held Nov. 22-26, 1943. Formosa was heavily bombed by American and British forces during 1945 preceding the surrender of Japan on August 14. At a formal conference for surrender of the Japanese in China held at Chihkiang airfield in the western Hunan Province on August 21, the Chinese announced that they would take over Formosa.

FOSTER, William Z., American Communist: b. Taunton, Mass., 1881. Foster had had a long and rather stormy career as Socialist, Communist and labor leader, when, on July 28, 1945, he was chosen to replace Earl Browder as head of the reconstituted Communist Party, which since 1944 had been called the Communist Political Association. Foster joined the Socialist Party in 1900; the I. W. W. in 1909; and the Communist Party about 1921. In 1919 he was active in organizing steelworkers for the great strike of that year. He was the candidate of the Communist Party for the presidency in 1924, 1928, and in 1932. In 1930 he was a candidate for the governorship of New York. He has attended a number of international Communist congresses, and executive meetings of the Comintern and of the Red International of Labor Unions. A prolific pamphleteer, he is also author of six books, *The Great Strike and Its Lessons* (1920); *The Russian Revolution* (1921); *Misleaders of Labor* (1927); *Towards Soviet America* (1932); *From Bryan to Stalin* (1937); and *Pages From a Worker's Life* (1939). The last two are autobiographical.

FOUILHOUX, Jacques Andre, American architect: b. Paris, France, Sept. 27, 1879; d. Brooklyn, N.Y., June 20, 1945. One of America's leading architects, Mr. Fouilhoux, in collaboration with Wallace K. Harrison, designed the

Trylon and Perisphere, which served as the distinctive symbols of the New York World's Fair in 1939-1940. Together with his associates, he helped design such famous New York skyscrapers as the Daily News Building, the McGraw-Hill Building, and Rockefeller Center.

Mr. Fouilhoux was graduated from the Sorbonne in 1898, and from the Ecole Centrale des Arts et Manufactures (Paris) in 1901. He went to the United States in 1904 and was naturalized in 1913. During the First World War, he served as captain and later as major in the 129th Field Artillery of the United States Army. He was a member of the firm, Whitehouse and Fouilhoux, Portland, Oreg. (1908-1917); associated with Raymond M. Hood in New York (1920-1934); a member of W. K. Harrison and J. A. Fouilhoux (1935-1941); and since 1941, of Harrison, Fouilhoux, and Abramovitz. Recently he had been engaged in defense work at the Naval Base, Canal Zone.

Mr. Fouilhoux was killed in what appeared to be a fall from the roof of a building under construction in the Clinton Hill housing project, which he helped design.

FOUREST, Georges, French poet and author: b. 1868?; d. Paris, France, Jan. 27, 1945. Although his output included only two small books of verse, *The Blonde Negress* and *The Oviparous Geranium*, and a collection of short stories, *Tales for Satyrs*, Georges Fourrest's work was reprinted many times, and literary critics agree that his poems will long figure in anthologies. These poems rigidly adhere to classical forms, while the substance is humorous and often ribald. Private means made it possible for Fourrest to ignore royalties and write solely for his own pleasure.

FRANCE. Second only to Germany in size among the countries of Europe, apart from the Soviet Union. At the last census (1936) France had an area of 212,659 square miles and a population of 41,907,056, excluding military and naval forces and merchant marine crews abroad, which numbered 107,538. The chief cities of continental France, with their populations in 1936 are: Paris (2,829,746); Marseilles (914,232); Lyons (570,622); Bordeaux (258,348); Nice (241,916); Toulouse (213,220); and Lille (200,575).

French Overseas Empire.—The French overseas empire, with an area of approximately 4,617,579 square miles, is second in size only to that of Great Britain. Its estimated population of nearly 65,000,000 is slightly greater than that of the Netherlands colonial empire. The area and population of the individual territories is shown in the following table:

Colony	Area	Population
Algeria	847,500	7,234,680
Tunisia	48,313	2,608,313
Morocco	162,120	6,242,706
French West Africa	1,815,768	14,944,830
Togo ¹	21,893	737,056
French Equatorial Africa	979,878	3,418,066
Cameroon ¹	166,489	2,513,517
Madagascar and dependencies ..	241,094	3,797,936
Indo-China ²	281,174	23,853,429
Somaliland	8,492	44,240
Réunion	970	208,858
French India	196	295,508
St. Pierre and Miquelon	93	4,175
Martinique	385	246,712
Guadeloupe	583	304,239
French Guiana and Inini	65,041	37,005
New Caledonia and dependencies ..	8,548	53,245
New Hebrides	5,790	45,000
French Establishments in Oceania ..	1,520	43,608

Defense.—No authoritative data is available as to the exact strength and composition of French land, sea, and air forces either prior to or after the defeat of Germany in 1945. However, on Jan. 1, 1945 it was disclosed that the navy comprised 305 ships with a total tonnage of 300,000, of which 180,000 tons were of major units (battleships, cruisers, and aircraft carriers), and 120,000 tons of light craft. They were manned by 6,000 officers and 77,000 men. In December 1944 it was stated that 25,000 men were engaged in the air force. The French First Army (one of the five allied armies along the western front), composed of units of the North African Army, the Fighting French Forces, and the French Forces of the Interior (FFI), played an important part in the defeat of the invaders, making deep penetrations into southern Germany before the surrender. An unofficial estimate of the army strength in November 1945 placed it at just under 1,000,000, including 400,000 active combat troops, most of whom were on occupation duty in Germany. During the summer and fall troops were sent to Indo-China to suppress a revolutionary movement.

Economic Situation.—The economic situation in France is the direct result of the destruction caused by the invasion and the liberation. In 1940, each of the nine departments of the north (Somme, Nord, Pas-de-Calais, Aisne, Oise, Ardennes, Marne, Seine-Inférieure, and Meurthe-et-Moselle) had more than 10,000 houses destroyed. During the occupation, aerial attacks by the Allies were directed chiefly to port, railway, and industrial installations in the west, north and center. The summer campaign of 1944 caused further ravages on parts of French territory that had hitherto escaped. The channel and Atlantic ports—Le Havre, Brest, Lorient, St. Nazaire, Bordeaux—industrial centers such as those in the Paris suburbs and at Lille, the Creusot works, St. Etienne, railway stations and communication centers such as St. Pierre des Corps, Abbeville, Amiens and Vierzon, especially suffered. The total destruction caused by the last campaign in France has not yet been definitely appraised. We may cite, however, the almost complete destruction of Caen and of many coastal regions of Calvados, Lisieux, Mortain, Tioarn, of Tilly-Sur-Seulk, of Avranches, of St. Malo, Fougères, etc. In their retreat, the Germans destroyed numerous villages, the inhabitants of which were not spared.

The railway network suffered severely from this fighting. At the moment of liberation not a single train moved in France. Of 11,800 steam locomotives which the country possessed before the war, and of which over 4,300 were taken into Germany, there remained only 2,800 that were serviceable; over 1,900 works of art were destroyed or damaged; 7,500 passenger cars and 55,000 freight cars were out of use; over 500 signal towers were destroyed, 1,300,000 square meters of marshaling and classification

¹ Under mandate from the League of Nations.

From 1920 until the Second World War, Syria and Lebanon (total area 57,900 square miles, pop. 3,630,000) together formed a French mandate under the League of Nations. In 1941 the Free French proclaimed the independence, first of Syria and later of Lebanon. On Dec. 27, 1943, representatives of the French Committee of National Liberation and of the states of Syria and Lebanon signed an agreement, effective Jan. 1, 1944, under which all powers exercised by France under the mandate were formally transferred to the Syrian and Lebanese governments.

² Prior to the Indo-China-Thailand conflict of 1940-41.

yards had been turned into great masses of twisted rails.

The state of road communications was hardly any better; 2,500 bridges in 50 departments were wholly or partly destroyed. At the moment of liberation, however, resistance groups had partially succeeded in limiting this destruction by imposing a check on the attempts at destruction by the Germans. One may visualize the situation by pointing out that on the Seine not a single bridge was left below Paris, while above it those of Juvisy, Corbeil, Melun, Montreuil, Nogent, Romilly, Troyes and others, and some of lesser importance were destroyed. Altogether, the network of waterways suffered less than railways and roads. As regards postal, telegraph, and telephone installations, over 20 buildings had to be rebuilt; 90,000 kilometers of aerial telephone circuits replaced, 60 amplification stations reestablished, 30 city networks put back into service, in addition to over 50,000 subscribers' stations.

These ruins, together with the harbor destruction, have seriously impaired the resumption of French economic life and the normal supply services of the people. A single example will demonstrate: In the port of Brest, import traffic, which reached 750,000 tons in 1938, has been reduced to nothing. For some months, the provisional government has neglected nothing to remedy this situation, but both economic and psychologic factors have prevented it from re-establishing, even in part, the prewar balance.

Some facts may be cited in explanation of the food scarcity in France: exactions and forced seizures by the occupying power, exhaustion of land deprived of fertilizer, lack of upkeep of planting and cultivation, the wearing out of agricultural machinery, decrease in number of livestock by unrestrained slaughter and by systematic pillage (for example, 25,000 head of cattle taken from Alsace into Germany during the final retreat), the loss of 25 per cent of work horses, the wearing out of tractors, lack of and enfeeblement of agricultural labor, and destruction of means of transport.

The meager food stocks in certain producing areas cannot be transported regularly to consumption centers. Between French provinces, there exists an interdependence in food supply to such an extent that France is threatened with a shortage once she is unable to function normally.

Under these conditions the black market has risen to alarming proportions, especially in foods. Despite attempts to check it, it appears that illegal practices cannot be entirely eliminated by repressive methods alone because basically they result from the great disparity between production and income. Prices have continued their upward trend while values have gone down. No means of stopping the price rise is yet visible after 11 years of increases.

In April, the Consultative Assembly passed the first budget of liberated France. It calls for 400 billion francs for expenditure, a figure to be increased in the course of the year by supplementary credits. Receipts, on the other hand, will be about 175 billion francs, showing a deficit of at least 250 billion francs.

The above details suffice to show that there exists great distress in France and that the rehabilitation, so eagerly awaited, will not be immediate. It will take a generation.

Economic Policy.—The new rulers of France have faced with courage the task of economic

rehabilitation. Some of their administrative measures, even if circumstances have hindered their full effectiveness, deserve to be noted. Gen. Charles de Gaulle, in a great speech early in 1945, specifically stated the intention of his government to orient itself in the direction of an economic democracy. In the organization of production a large share was to be left to private initiative, to free enterprise sharpened by competition and the profit motive. "We cannot imagine the French economy of tomorrow without a free sector and that as extended as possible." But, in the economic order, there are set limits to a pure and integral liberty.

In the free field, first of all, the ideal of liberty must not exclude the ideal of a social union, of a national purpose. The working class has shown that it is fully cognizant of its duty. It must be a part, in mind and heart, as well as by hand, of management, organization and promotion of business. This association is three-fold: in the business itself, where business committees have been formed; in the trades, where trade offices are henceforth to consist of all branches of the trade under the chairmanship of a state representative; finally, on a national plan, "the government is preparing to set up a new National Economic Council on which will sit representatives of all the trades and professions." Thus, emphasis is laid on the notion of association.

However wide the field left to free enterprise, it will not be allowed to constitute the entire national economy. The government foresees the rise of a public sector alongside the free sector; and in this connection, the government has indicated its purpose to exploit directly, or at least under its immediate control, all basic industry, such as coal mining, power and oil industries, transport and communications and the metal production industries. While a change of setup is necessary, the government does not intend to act in haste. "The timing and selection and nationalization are matters to be carried out in due course after preparation and a study of means," and, moreover, the final decision rests with the nation, not with the government. "It is for the representatives of the nation to make final, or to change, as they see fit, the temporary measures we have taken and shall have to take." In any case, it is selecting administrators and controllers "who by their initiative, their technical knowledge and their desire to succeed, are capable of giving to these (state) undertakings the imprint and character of commercial enterprises." In the future, therefore, a distinction must be made between various kinds of office holders.

Finally, the government reserves the right to give direction and measure to all economic activity. It states clearly the principle of these new duties: "The state alone is qualified so to arrange matters that the multifarious activities within it constitute a whole, in which the entire nation has its part and which is integrated with world economic development."

This economic direction the government reserves to itself through control of new enterprises. National savings are to be directed toward the financing of basic industries and special interest groups are not to be permitted to hinder this effort. Finally, as may be necessary, each enterprise is to be responsible to the nation. Here in brief is the economic chart of the new France.

Thus emerge the broad lines of the pro-

FRANCE

Laboratory in which Frederic Joliot and his wife, Irene Curie, made experiments with uranium.

jected social organization, in which are brought together as in all political systems, both the demands for liberty and of public order. The part reserved to private initiative remains very large but its managers are given new assurances, new duties. Once again, the idea of the state is changed: alongside the three traditional powers—legislative, executive, and judicial—emerges a fourth, the economic.

How far have these ideas been put into practice? Public bodies have concentrated attention on four main heads: reorganization of the productive machinery; restoration of property destroyed; the condition of the people; and distribution. By an ordinance of Feb. 22, 1945, a larger share was given managers and assistant managers in the relation with different professional categories through the setting up of business committees. The government is endeavoring to recast and reform certain production organizations. In the free enterprise field, the spirit of freedom must not exclude that of co-operation. In the public domain, nationalization must not imperil industrial and commercial initiative. In short, directives, however liberal, demand a minimum of general organization.

In the course of 1945, two economic theories came into sharp conflict. Here it is necessary to give briefly the views of the two groups supporting these opposing concepts. One group has a tendency to overestimate the importance of the role of money in economics and to underestimate the role of production. At the same time it refuses to see in public finance an autonomous technique apart from economics. Instinctively its partisans see in public finance the financial expression of one part or sector of the national economy—the public sector. They grant too much to state intervention, not enough to the reaction and initiative of the individual. The other group, on the contrary, partisans of a more flexible intervention, of an economy directed along less rigid lines, refuses to admit that the rehabilitation of France's economy depends first on a clearing-up of the monetary situation. For these, her rehabilitation will come through careful financing coupled with a resumption of production. They see in public finance an activity relatively autonomous which must subordinate economics rather than be subordinated to it, or integrated with it.

Necessarily, under such conditions the relative importance attached to these matters by the two groups differs. For the first, it is currency, production, public finance, in the order stated; while for the second group it is the same but in inverse order. Pierre Mendès-France, minister of national economy, supported the first contention while René Pléven supported the second. Prolonged Cabinet discussions lasted to April 5 when Mr. Mendès-France resigned and soon afterward the functions of his ministry were placed under the Ministry of Finance.

This appears to be the logical solution, the one most conformable alike to the nature of things and the interests of France. In effect, any economic policy, which does not place first the immediate restoration of production, a rapid rise in savings, with confidence in the future of the country, is full of danger and that within a brief time. Everything in its turn—sound finances and mounting production—will give France a sound currency. The immense effort made throughout 1945, even if it has had no outstanding success, marks a step in the right direction. The period of hesitation and of pro-

ceeding by trial and error should soon be at an end.

Social Policy.—In an impoverished France it was necessary above all else to raise salaries. Hence the increase decided by the ordinance of Jan. 6, 1945, effective from February 1. It is a question, not of a simple adjustment, but of many conditions of remuneration tending to assure a revaluation of public service. The increase affected all positions but does not call for a ceiling in its application. The ordinance put an end temporarily to a part of the purchasing power delegated to officeholders receiving over 100,000 francs through the setting up of an obligatory withholding (tax) proportioned to the salary and to the family charges and carried in a special account bearing a small interest.

An ordinance of February 2, granted the labor services the power to transfer male workers, deprived of their customary work, to carry out work necessary to the national economy. This transfer, the refusal of which would be punished by exclusion from all allowances then in force, included the following material compensation, in addition to the regular wage at the new job in the locality in which it is carried on. When the worker is unable to reach his home every evening, he is granted either a premium equal to 10 to 20 hours pay (for lodging) per week; or a daily sum varying according to the zone of origin and the condition of his family, or the maintaining of family allowances at the rate applying in the place where his family resides.

•On March 27, 28, and 29, the National Confederal Committee (CCN) which acts as the administrative council of the *Confédération Générale du Travail* (CGT or French Federation of Labor) met in Paris. The National Committee of the *Confédération Française de Travailleurs Chrétiens* (CFTC, or French Confederation of Christian Workers) in turn met on April 16–17 to determine the objectives of Christian syndicalism, to fix the conditions of a French reconstruction program and social peace and to define its public relations generally. What are the tendencies of trade-unionism? The most disputed of these, not new but possessed of new vigor today, is the pretention to universality (the one big union). This great objective of the trade union movement is very clearly placed in relief by the work of the two above-mentioned committees in a report presented by the office of the Federation of Labor and by a resolution adopted concerning the organization of the peace. Representation of trades unions at the preparative peace conferences was demanded, also in the international organizations to be instituted thereat and stemming from the same.

The desire for unity is the second pronounced tendency to emerge. Working-class unity first, and this is the problem of the confederation, and then unity of organization as regards the various classes of workers. If trade-unionism is thus seeking unity or at least an organic understanding, it is because it sees the possibility of increasing its constructive activity. In turning in a direction clearly constructive, the trade-union movement has no intention of renouncing labor's claims, which rest on proved means of collective bargaining, of standing together, better understood by its members than any projects of reform. Finally, in the plan of large reforms of organization, trade-unionism has declared for nationalization, but not for any and every kind of nationalization. The National Confederal Com-

mittee reminds us that "every reform which does not entirely exclude from the management of industry the representatives of the holders of capital, cannot be considered a true nationalization." Similarly, a motion of the national committee of the Confédération Française de Travailleurs Chrétiens sets down the ideas of Christian trade-unionism in regard to this reform conceptions which condition its total adherence to the measures already taken or to be taken. Trade-unionism desires to collaborate with the government, but without loss of its autonomy and its liberty of thought and action.

In view of the deficient documentary material at hand, it is impossible to give an adequate picture of nutrition as to the entirety of French territory, because the living conditions of the French people, during the German occupation, were marked by great inequalities. The chances of provisioning were, and so remain, very different according to locality, the social classes, the professions and the family circle. While some cities endured slow starvation, others, situated in richer or better served regions, were provisioned almost in normal fashion. In general, the rural population lacked only goods from abroad; some provinces, like Normandy, took no account of restrictions, while the wine-growing regions of the Midi suffered almost as much as the cities.

It is easy to estimate the consequences of this undernourishment on the state of health of the French. In the great urban centers the food supply was clearly insufficient—about 1,300 calories for adults. These food conditions in the great cities brought out a certain number of organic deficiencies which will not soon be amended: (1) if the norms of weight and height of the newborn remain at the old standard, about 30 per cent of the children are greatly under weight; (2) emaciation was general among the urban population, less among the young than among adults and the aged, more frequent and more accentuated among men than among women; (3) anemia was disclosed among the greater part of those examined and the count of red corpuscles was generally low; (4) biologic tests disclosed a lack of vitamins among 20 per cent of those examined, and more frequent among the very young; (5) the pathology of diseases due to lack of vitamins made its appearance; (6) tuberculosis and infectious diseases increased considerably.

The decisions taken by the Council of Ministers on the subject of increased taxes on some rents were the result of a compromise between several conflicting theories. They bear the mark of this origin and have the earmarks of a temporary character. The problem of housing has reached such a degree of complexity that it can be solved only in successive stages. The government has simultaneously re-established a certain balance between upper higher rental brackets and has permitted the gulf to widen between these higher brackets and those which, since 1914, social considerations had caused to remain static.

The setting up of a National Housing Bank (Caisse Nationale de l'Habitat) and a Housing Office is important. It is certain that reconstruction will impose tasks of such amplitude that they cannot be abandoned completely to the initiative of private capital. The outlay already in view by the bank is only a first stage in the inevitable intervention by public authority.

The setup of a Sanitary Building Registry is another part of this housing policy, on which will depend in great measure the recuperation of France.

The Ministry of Reconstruction is going ahead with town planning and programs for the revamping of the building industry.

The government has in hand a number of supplementary measures. The task is huge, for France, aside from the vast amount of destruction to be repaired, must overcome the heavy handicap of a housing policy, which for 30 years had already proved insufficient. This work is therefore indispensable and must be given first priority in the social policy of the new France. It bears within itself the elements for the solution of many other pressing problems—to mention only the population problem about which the authorities are justly worried.

In the course of an address, General de Gaulle declared that the bringing into force of a policy concerning the birthrate and a policy of immigration were high on the program of the great reforms slated for accomplishment in 1945. It is well known that depopulation is one of the essential factors which have contributed to put in doubt France's place in the rank of the great powers. For a century the population of France has increased, growing from 35 to 42 million, but aside from foreign immigration, this increase has been due to a lengthening of the life span. The number of persons under 15 years of age has not varied; on the other hand, the number of old men has increased by 70 per cent. Hence a constantly increasing numerical disproportion between the aged and the young. France is becoming a land of old men.

In addition to legislation designed to favor the normal growth of families, thought must be given to a controlled immigration. The most interesting case is that of foreigners residing in France before the war, who sought refuge beyond her borders during the occupation. Among these were well assimilated elements following a stay of many years in France.

There is a body charged with this matter of immigration. It is the Secretariat General for Family and Population, and is part of the Ministry of Public Health. It began to work against the menacing scourge of the human impoverishment of the country. Without in any way prejudicing the need for national cohesion, it is absolutely necessary that France have more Frenchmen if she wishes to resume her eminent role in the world. Her political as well as her social life thus is a biological problem to the solution of which the present authorities are devoting themselves, understanding as they do the urgency of the situation and the necessity of applying a remedy without delay.

Foreign Policy.—The outstanding events in foreign relations in 1945 were at first military and secondly diplomatic. In both of these the position of France felt the effects of the defeat of 1940 and the terrible years of occupation. Herein are given a few dates which mark stages on the road back.

Jan. 20, 1945: the date of the French offensive in the Colmar region, resulting in the liberation of the city on February 3. March 15: the Third Army crosses the Moselle and takes Coblenz. March 20: French troops enter Germany and cross the Rhine on March 31. April 4: the French take Karlsruhe; the 16th, Kehl; the 22d, Stuttgart and Fribourg; the 24th, Ulm. The following day, Marshal Pétain is placed

under arrest and the conference for world security opens at San Francisco.

The trials of the leading collaborators come under this head because they created quite a stir and reopened a quarrel which had begun and flourished under the government of Vichy. The two chief defendants were Marshal Pétain, to whom Paul Reynaud consigned the powers of president of the Council of Ministers a few days before the Armistice of June 1940 and who thereafter became chief of the French State; and Pierre Laval, thrice president of the Council before the war and the right arm of the marshal during the occupation. The trials of these two opened in an atmosphere of unbridled passion and before a court composed of former members of the Chamber of Deputies and of the Maquis (French Forces of the Interior). The proceedings were violent in the extreme and the elementary rules of the administration of justice were constantly broken. At length, Marshal Pétain, who had refused to defend himself, was condemned to death. The chief of the provisional government (General de Gaulle) because of the marshal's great age and of his eminent services to France in the past, commuted the penalty to life imprisonment and civic degradation. Laval was also found guilty of collusion with the enemy and condemned to death, despite his protestations of innocence. After an unsuccessful attempt at suicide, he died before a firing squad on October 15. So ended one of the most regrettable episodes of contemporary France and one which seriously impaired her prestige throughout the world.

At San Francisco, the French delegation, headed by Georges Bidault, minister of foreign affairs, included the finance minister, René Pléven, the minister of health, François Billoux, former Minister Paul Boncour, General Juin, and Admiral d'Argenlieu. In the nine weeks of deliberation, the attitude of the French delegation was one of waiting and of reserve, a reserve due to the circumstances that the French had been successively excluded from the preliminary talks at Dumbarton Oaks and from the Crimea (Yalta) Conference, as they were later to be excluded from that at Potsdam.

Among the powers dominating affairs at San Francisco, there was a very select hierarchy. At times the Big Five conferred, and then France participated. More often, the inner circle comprised the Big Four. As a general rule, all important decisions were made by the Big Three, and then China and France had to content themselves with learning the result from the newspapers or by conversations in the corridor.

This situation bore heavily on French self-esteem. On several occasions, Mr. Bidault made known his resentment at seeing his country relegated to a minor role. He succeeded, however, in having French recognized as an official language and in setting forth the French stand on the muddled question of trusteeship and in expressing firmly and with dignity the French demands for the Saar and the Ruhr.

The Council of Foreign Ministers of the five great powers, gathered in London following a joint decision of President Harry S. Truman, Prime Minister Clement Attlee and Premier Joseph Stalin, furnished the world an example of deep misunderstanding. In the British capital, as at San Francisco, the French delegation faced several rebuffs with courage and dignity, showing their determination to lead the discussions to positive results. The discussion of

French claims did not come up until near the close of the deliberations at a time when everybody could foresee their denial. Again, Mr. Bidault endeavored to have the French viewpoint prevail—that is, that the Rhine barrier is and remains the most potent defense of all Europe, on condition that France be enabled to police it and that she be permitted to make use of the mineral resources and coal mines of Germany.

In the zone of occupation given her, France is trying to fulfill scrupulously her obligations without needlessly bullying the Germans. At the moment, France is credited with having the intention of grouping certain elements to form a kind of moral and economic federation in western Europe, in which a democratic Germany would have a part under the tutelage of France. So far it is only a project which may be brought into clearer perspective in the next few months.

Lastly, General de Gaulle visited President Truman in Washington for a brief conference in the hope of obtaining credits to aid in the economic rehabilitation of France. The results of the visit have yet to make themselves apparent.

All in all, France has shown considerable energy and foresight in resuming her traditional role in world affairs. The meager results thus far obtained are due to a general situation for which she is not responsible and to remedy which is hardly incumbent on her.

Colonial Policy.—The sad happenings in Syria and Lebanon, as also the threats of revolt in Indo-China—common phenomena to all present-day imperial powers—focused the attention of the French on their colonies. Various measures were taken to improve conditions in the heart of the world's second colonial empire. Here are a few designed to strengthen the ties between the homeland and its distant possessions.

Henceforth, an overseas period of residence will be a prerequisite for all candidates for positions as colonial administrators. There is under way also a reform of the inspection service which will oblige inspectors to have not only a general knowledge of the problems of a single colony, but also of the entirety of problems of the same nature common to all colonies.

In order to prepare for native representation, the government named a commission to fix the proper number of delegates to the Constitutional Assembly. It also set up a Council of Representatives in Madagascar, and in Indo-China, and gave attention to the setting-up of local representative bodies all over the empire. A series of ordinances reformed the system of native justice, especially in the Cameroons, Togo, and French West Africa.

The government also took steps to modernize the colonial labor system. Inspection of labor was extended. Freedom to work and freedom of association were proclaimed. This has permitted unions to be formed and a colonial labor code to be drawn up for submission to the Council of State. To provide for a better orientation of overseas products, there was set up an Office of Colonial Agriculture, Stock Raising and Forests.

The overall purpose has been to effect a closer relationship between the French at home and the French overseas. The present colonial unrest stems from the fact that, during the past five years, there has not been active give-and-take between the French settled on home acres and those settled on the virgin lands overseas without which the idea of empire fares badly.

That the government has understood this is shown by its having placed human needs ahead of the acquisition of wealth. It has set up in the Colonial Office a division of colonial information. It has been recommended to the Consultative Assembly that the Ministry of National Education grant scholarships to students who have given proof of their knowledge and character; also that the study of law, history, and colonial economics be enlarged in the proper teaching faculties.

In this way only will it be possible to battle efficiently against the threats of disintegration which would entail a moral and material impoverishment for France and would quickly relegate her to the rank of a secondary power.

National Policy.—During the occupation, the old parties were more or less subject to disintegration. The groups of the Right have almost disappeared and about in the measure that their elements had given support to the Vichy regime. Even the parties of the Left have not been spared from an inevitable crumbling. Moreover, the resistance groups have fallen into factions and seek recognition for their services to the French cause. Lastly, to complicate still more the analysis of the French political map, the emigrés gathered under the banner of Free France have re-entered the country and seek to play a political role therein.

For many months, the unification of the resistance groups was the great question to the fore. Unity was to bring all movements into one to be called the National Liberation Front in which were to be gathered all adherents, of even widely differing political thought and including even the militant Communists. This diversity would have obliged the unifying movement to have no other common program than some ideas and sentiments which were common to the resistance movement as a whole—anti-fascism, the will to independence, national greatness, republican and democratic sentiment, a desire for liberty, a deep desire for political reform, anger toward certain citizens deemed responsible for the defeat and toward profiteers from the occupation, finally dynamism and indifference to violence. This attempt at classification could not be fully accomplished; partisan passions and ideological differences were too strong. In the past few months there has been a reorientation of parties and the confusion apparent early in 1945 has given place to a new regrouping of French political forces, with a marked leaning to the Left, which is understandable from both historic and social reasons.

The session of the Provisional Consultative Assembly began on February 6 and was the occasion for a lively exchange of viewpoints. Three ministers were especially the target of attacks. They were: M. de Menthon, keeper of the seals; Diethelm, minister of war; and Teitgen, minister of information.

The first-named was especially charged with having kept in the administration of justice, magistrates who appeared unable to understand the importance which judicial actions should have during the year following liberation. It was said that they delayed the organization of courts which, had they functioned earlier, would in great measure have been able to prevent disorders. Failing to do so they had permitted too many arbitrary arrests. They showed themselves unwilling to try to set up the apparatus and special personnel necessary to put a full and speedy end to disorder. They appeared to

have a too narrow view of the situation in which the court administration found itself and sought overzealously to maintain the traditional order both in method and personnel.

As regards M. Diethelm, he was accused of systematic favoritism toward the army officers of the armistice at the expense of those of the resistance and even of those of the Free French Forces.

Herein lay the problem of the formation of a renewed French Army. The minister's replies were hardly satisfactory and it is difficult to consider them as separate from the general policy of the government in this matter.

The chief reproaches against the minister of information had to do with the prohibition against publication of certain worthy newspapers and the authorization given certain others shown to be unworthy. Lack of paper, the censorship, dictatorial methods of this ministry were other complaints voiced in the assembly. M. Teitgen emerged the victor from these accusations by insisting on the difficulties inherent in the situation at the time.

A long and bitter debate followed on school subsidies. The problem is this: a subsidy of 500 million francs to free schools was provided in the budget of national education in conformity with a law promulgated by the government of Vichy. A strict return to republican legality would involve the cancellation of these credits. But was it necessary to bring about this cancellation in the middle of the school year or continue the subsidies?

Campaigns conducted throughout the country awakened lay susceptibilities. They caused many to fear that many Catholics were unwilling to go back to the old doctrine of state supremacy in the matter of education. Some criticized the prewar public school system and asked for the installation in France of separate church schools. The reaction of political parties, movements, and educational associations attached to lay schools was very strong. The government had taken a position capable of rallying all parties. A commission had been in existence for several months, composed of eminent men of diverse points of view and charged with examining the changes necessary in primary education. The government felt that if the cancellation of the subsidies could be decided as to principle at once, the application should be put off some months for material reasons, such as the insufficiency of public school buildings and the impossibility of replacing teachers of the free schools everywhere by public school teachers.

In the assembly, the debate waxed warm and the Tessier amendment favoring continuance of the subsidies was rejected, 128 to 48. Nevertheless the government, ignoring the assembly, decided to continue the subsidies up to July 15. From this debate three things also worthy of note in other matters in dispute emerged: (1) the fact that the assembly was purely consultative detracted greatly from the weight of its vote. (2) The great majority of the assembly remains warmly attached to the lay system and is suspicious of clerical sectarianism in certain quarters. (3) The get-together tendency between the strict Socialists and those of the spiritual (parlor) type seems to have been compromised for good.

The great debate touched on the constitution. There were clearly defined divisions among the parties into single-chamber and bicameral groups; the radical Socialists and moderates (the Popu-

FRANCE

Gen. Charles de Gaulle is acclaimed by the population of the battered city of Brest.

Mrs. de Gaulle casting her vote. On April 29, 1945, women voted for the first time in the history of France.

lar Republican Movement, MRP excepted) remained faithful to the Constitution of 1875, while the Socialists and Communists as also the several resistance groups showed their preference for a single chamber, endowed alike with legislative and constitutional powers, and chosen according to the principle of proportional representation.

General de Gaulle took a position closely approaching the radical, asking that members elected be formed into a constitutional assembly to elaborate the institutions of the Fourth Republic, but that during the seven months they worked on this, they were not to meddle in the administrative tasks of the provisional government. It was this view which in great part won out in the popular referendum of October 21, at which the Socialists and the members of the Popular Republican Movement obtained a success which places on them responsibility for the future. It can be said of the election, as of the cantonal elections that preceded it by a few weeks, that the country voted for the resistance, that it voted Left, that it voted for a complete change in the economic setup and in men and party.

The October 21 elections gave the Communists 152 seats, making them the largest single party; but they were nearly tied by Leon Blum's Socialists with 142 seats, while the MRP, which is supposed more nearly to reflect General de Gaulle's view, won 138 seats. In accordance with its mandate the Constituent Assembly began to function on November 6. Its term of life is limited to June 6, 1946, by which time it must have agreed upon a new constitution, or confess failure. In the latter event, another assembly will have to be elected to repeat the attempt. The constitution as finally drawn by the assembly will be submitted to a popular referendum. General de Gaulle's provisional government surrendered its powers to the Constituent Assembly which after a brief delay returned them to him as head of the continuing provisional government.

The task of the new Constituent Assembly is immense. It must remedy the errors of the past and fill the gaps in the Constitution of 1875, especially by strengthening the executive power in order to avoid the chronic instability of the Cabinet, while at the same time safeguarding the demands of a democratic regime. This is the price of safety.

The Literary Balance Sheet.—We are just beginning to learn what happened in the literary field in France during and since the occupation. New books were few and the greater number, of necessity, were written in secret. Many writers, known for their patriotism and their hatred of the invader, were obliged to remain silent. Others fled to the United States, Canada, Switzerland and Latin America. Withal, France continued to think and to produce works of great value.

But first, let us count the losses. Some, like Jean Prévost, died bearing arms; or disappeared like Saint-Exupéry who had previously published *Pilote de Guerre* and *Lettre à un Otage*; were executed like Jacques Decour; were victims of German barbarity, like Benjamin Crémieux, Max Jacob, and Louis Mandin, in concentration camps. Also there were those who collaborated with the Germans and who now find themselves ostracized from the French community, like Abel Hermant, Abel Bonnard, Charles Maurras, Jacques Chardonne, Alphonse de Chateaubriant,

Henry de Montherlant, Drieu la Rochelle, who committed suicide, Robert Brasillach, executed after trial, and Georges Suarez, who had a like fate.

From Tunis, André Gide published his *Interviews Imaginaires*. From America, Jules Romains, André Maurois, Jacques Maritain, and Georges Bernanos have continued their work, as did Francis Carco in Switzerland. Suspected by the invader, Mauriac, Duhamel, and Valéry did not publish. That great writer, Jean Giroudoux, died under mysterious circumstances, while Paul Valéry, one of the three greatest of present-day French writers, died early in 1945.

Since the liberation, Georges Duhamel has published the first two volumes of his memoirs, *Inventaire de l'Abîme* and *Biographie de mes Fantômes*. In the field of the novel the following deserve mention: a story collection, *Bellavista*; the novels *Julie de Carneilham* and *Gigi* by Colette, who was recently admitted to the Academy Goncourt; *La dernière harde*, by Maurice Genevoix; *Le fil d'Ariane*, a tale by Francis de Miomandre; *Pauline*, the story of a young girl of 1880, and *L'Herbe à pauvre homme*, a write-up of a lewd crime, by André Billy. To these should be added *La Terrasse du Luxembourg*; the *Voyageurs de l'impériale* and *Aurélien*; *Mille regrets*; *Le Cheval blanc* and *Le premier accroc coûte 20,000 francs* by Elsa Triolet, wife of Aragon. This last work earned its author the Goncourt Prize, while the jury of the Théophraste-Renaudot Prize favored *Les Amitiés particulières* by Peyrefitte; *L'Etranger* by Albert Camus.

The occupation brought forth a harvest of poetry. Reviews and posters mushroomed under the very eyes of the enemy. New reviews like *Les Cahiers du Sud*, *Fontaines*, *Confluences*, *Fusées*, gave evidence of great activity. Among the noteworthy poets were Pierre Emmanuel, author of *Tombeau d'Orphée*, *Jours de Colère*, and *Combats avec tes défenseurs*; Louis Aragon, author of *Le Crève-cœur* and *Les Yeux d'Elsa*; and Paul Elmar, author of *Poésie et Vérité 42* and *Dignes de vivre*.

For the war record, we may mention the works published in secret in the Editions de Minuit, especially *Le Cahier noir*, in which Mauriac took the pseudonym of Forez, and *Le silence de la mer* by Vercors. Personal experience works included *En automitrailleuse à travers les batailles de mai* by Guy de Chézal; *Tourelles de mai*, *patrouilles de juin*, by Pierre Hennequier; *Ceux des chars*, by Pierre Voisin; *Dites-le-leur*, by Jean Agapit. It goes without saying that the bulk of war volumes appeared outside France, notably in America.

In the field of learning, we mention among others a profound study of Rousseau's *Emile* by Father Ravier, S.J.; a study by Jacques Bachelot of the critic Etienne Delécluze, pupil of the painter David and friend of Stendhal and Mérimée; a thesis on Stendhal by Jean Prévost and the final edition of *Souvenir d'Egotisme* by Henri Martineau; the complete edition of Mérimée's letters, a critical edition of Maurice Parutier, one of Sainte-Beuve by Jean Bonnerot, one of Lamartine by Henri Guillemin, who under the title *Cette infernale affaire* again describes the Hume-Rousseau dispute.

Among biographies there appeared a *Lamartine* by the Marquis de Luppé, a *Montaigne* by Auguste Bailly, a *Molière* by Pierre Brisson; *Jean Racine* and *Beaudelaire et la Présidente* by François Porché; the *Souvenirs sur Huysmans*

by Lucien Descaves; a life of Balzac by André Billy, *Stéphane Mallarmé* by Henri Mondor, works by Van Tieghem on *La littérature comparée*; by Daniel Mornet on *L'Histoire de la littérature classique en France*; by René Bray on *La formation de la doctrine classique en France* and on Boileau.

All this time the Académie Française was in a bad way. Death created several vacancies. To these must be added the vacancies caused by expulsion of several members for national unworthiness and the absences from France of others. Sessions at present can count on only 19 Academicians. It is to be hoped that this learned group will soon fill its empty chairs so that the Forty Immortals will again live up to their name.

ROGER DUHAMEL,
Avocat et journaliste; ancien président de la Société Saint-Jean Baptiste.

FRANK, Bruno, German poet, novelist, and playwright: b. Stuttgart, Germany, June 13, 1887; d. Beverly Hills, Calif., June 20, 1945. Both as a novelist and as a playwright, Dr. Frank won a large public in Europe. He is probably best known in the United States for his historical novel, *A Man Called Cervantes*, which was the Book-of-the-Month Club selection for March 1935.

After attending the Stuttgart Gymnasium, Dr. Frank studied at the universities of Tübingen, Munich, Strasburg, and Leipzig. The son of a successful banker and merchant, he gave up commerce at the age of 18, brought out a volume of verse, *Aus der Goldenen Schale* in 1905, and thereafter supported himself by his pen. His first novel, *Die Nachtwache*, was published in 1909. During the First World War, he served in Poland and in France. After Hitler assumed power, he left Germany, and went to the United States in 1937, where he worked on the scripts of several motion pictures, including *The Hunchback of Notre Dame* and *A Royal Scandal*.

Dr. Frank's works include *Flüchtlinge* (1911); *Requiem* (1913); *Die Fürstin* (1915); *Erzählungen* (1920); *Tage des Königs* (1924); *Trenck* (1926); *Politische Novelle* (1928); *Der Magier* (1929); *Cervantes* (1934); *Der Reisepass* (1937); *Die Tochter* (1943); and a book of poems, *Die Schatten der Dinge* (1912). Of his plays, *Zwölftausend* (1928) achieved special success and was seen in more than 150 continental theaters. Other plays include *Die Schwestern und der Fremde* (1918); *Nina* (1931); *Der General und das Gold* (1932); and *Sturm im Wasserglas* (1930), which was presented in an English adaptation by the Theater Guild in New York in 1937, and filmed in England the next year.

FRANKLIN INSTITUTE, The. Founded in 1824, the Franklin Institute, Philadelphia, Pa., is one of the oldest institutions in the United States devoted to the study and promotion of the mechanic arts and applied sciences. Since 1938 it has also been known as the National Memorial to Benjamin Franklin. For an account of its early history and expansion (1930-40), see *THE AMERICANA ANNUAL* for 1941.

The staff of the institute, its work shops and research laboratories have been devoted almost entirely to the war effort. Research work for the government is still carried on. Despite this, the usual routine of the institute has been followed as closely as possible.

A Franklin Medal was awarded in 1945 to

Dr. Harlow Shapley, director of the Harvard College Observatory, Harvard University, for his many valuable contributions to the science of astronomy. Nine other medals were also awarded for scientific achievements, among them two Cresson medals (founded in 1848, the oldest award given by the Franklin Institute) to Rear Admiral Stanford C. Hooper, USN (Retired), for his achievements in the field of radio for the United States Navy; and to Prof. Lewis F. Moody, professor of Hydraulic Engineering, Princeton University, for his contributions to this field of engineering.

An outstanding series of lectures was given throughout the season; the *Journal* was published regularly; the library containing 130,000 books and 44,000 pamphlets, reported a continuance of requests for technical and patent literature by war and research workers; and attendance at the museum and planetarium showed a decided increase. In September 1944 the institute was honored for its war work and received public recognition when the Ordnance Department of the U.S. Army bestowed upon it the Distinguished Service Award. The presentation was made by the Chief of Ordnance, Maj. Gen. L. H. Campbell, U.S.A., at the Franklin Institute. In October 1945 the Bureau of Ordnance, Navy Department, voted the institute the Navy Ordnance Development Award.

The educational department of the Franklin Institute has made closer contact with the school children during the past year with the result that many thousands have visited the museum. Two radio programs were inaugurated to which the children listen during school hours.

The National Franklin Committee, formed in 1941 to promote public interest in the life and writings of Benjamin Franklin, with special emphasis on his homely virtues and timely philosophy, distributed free of charge thousands of pieces of literature regarding this great American. The institute's publications *Meet Dr. Franklin* and *Profile of Genius* continued to appeal to a wide public. These books are sold in addition to the other material regarding Franklin, which is distributed free of charge.

HENRY BUTLER ALLEN,
Secretary and Director, the Franklin Institute.

FRASER, Leon, American banker: b. Boston, Mass., Nov. 27, 1889; d. North Granville, N.Y., April 8, 1945. President of the First National Bank of New York since 1937, and former president of the Bank for International Settlements, Leon Fraser was one of the leading financial figures of the United States and the world. Mr. Fraser received a B.A. degree in 1910, an M.A. degree in 1911, a Litt. B. degree in 1913, and a Ph.D. degree in 1915, all from Columbia University. While still at Columbia, he worked for about a year as a reporter on the *New York World*, and in 1914 was admitted to the New York bar and became a lecturer on political science and an instructor in public law at Columbia. He entered the army as a private in 1917, and emerged from the war as a major and a judge advocate in the Service of Supply, American Expeditionary Forces. In 1920, he became associate counsel and assistant director of the Bureau of War Risk Insurance, and the next year served as executive officer and acting director of the United States Veterans Bureau. He left government service in 1922 to practice international law in Paris with Coudert Brothers, and in 1924 was legal adviser to the American dele-

gation to the London Prime Ministers Conference. From 1924 to 1927, he was general counsel to the Dawes Plan and Paris representative for reparations payments. He attended the Paris Conference of Financial Experts which drafted the Young Plan in 1929, and in 1933 was a member of the commission of experts at the London Monetary and Economic Conference. He became vice president and director of the Bank for International Settlements at Basel, Switzerland, in 1930, and president and chairman of the board in 1933. He came to the First National Bank of New York in 1935 as vice president.

Mr. Fraser received the Distinguished Service Medal, and was made a grand officer of the French Legion of Honor, the Order of Leopold of Belgium, an officer of the French Academy, and a commander of the Order of St. Sava of Yugoslavia. He was a director of the General Electric Company, the International General Electric Company, the United States Steel Corporation, the New York Central Railroad Company, and the Federal Reserve Bank of New York; and a trustee of the Mutual Life Insurance Company, Columbia University, Union College, the American Red Cross Endowment Fund, and other groups. In 1944, he served as chairman of the New York Clearing House Committee and also as national chairman of the American Red Cross War Fund.

Mr. Fraser killed himself by a shot through the head after writing two notes, one of which told of "melancholia that steadily gets worse."

FREEMASONRY. According to the latest available information, there are 15,264 Masonic lodges, having a total of 2,565,391 members, in the 48 states of the United States, the District of Columbia, and Puerto Rico. During the Second World War the Masons concentrated to a very large extent upon welfare work for their men in the service and the families thereof. The Grand Lodge of the State of New York, for example, raised, in the year ended July 30, 1945, a war chest of \$2 per capita from its 250,290 members (as of Dec. 31, 1944), for the maintenance of service centers for men of the armed forces, both Masons and non-Masons. This lodge has its headquarters in Masonic Hall, 71 West 23d Street, New York City, 10. Charles W. Froessel is grand master, and Charles H. Johnson is grand secretary.

FRENCH CAMEROUN. See CAMEROUN.

FRENCH EQUATORIAL AFRICA. A federation of four French colonies in central Africa. It extends along the west coast of Africa between (Spanish) Rio Muni, on the north, and (Portuguese) Cabinda, on the south; inland boundaries, on either side, are (French) Cameroun and the Belgian Congo; and it stretches northward to Lake Chad and the frontier of Libya. The total area is 959,256 square miles, and the population as of Aug. 1, 1943, amounts to 3,730,809, of whom 6,099 are Europeans. Brazzaville (pop. 47,000) is the headquarters of the governor general. The federated colonies constituting the administrative unit known as French Equatorial Africa are as follows:

	Area sq. mi.	Popula- tion	Colonial capital
Gabon	93,218	409,739	Libreville (4,500)
Moyen Congo. . .	166,069	746,805	Brazzaville (47,000)
Oubangui			
Chari	238,767	833,916	Bangui (13,500)
Chad	461,202	1,432,555	Fort Lamy (6,000)
Total	959,256	3,423,015	

Education of the population has scarcely commenced. In 1944 there were 260 schools with 28,692 pupils.

The economic resources of the federation remain largely undeveloped. Cotton, coffee and cacao are cultivated to a limited extent, and wild rubber and products of the oil palm are collected, while stock raising is carried on in Chad colony; other industries are lumbering and diamond-mining. Export of ivory and hardwoods decreased following the outbreak of the Second World War, but there was an increase in other exports, particularly cotton, rubber and palm-oil products. Nevertheless, there was a large decrease in the volume of exports as compared with prewar. In 1944 117,700 tons of produce were exported, compared with 333,900 tons in 1938. While the value of these decreased exports was 690,400,000 francs against only 264,100,000 francs for nearly three times the tonnage in 1938, the comparison was inexact, for on March 8, 1944, the franc had been depreciated by 13 per cent in French Equatorial Africa and in certain other French colonies. A like consideration applies to imports, which fell only slightly in tonnage but were valued at more than twice as much. In 1938, 76,300 tons of imports had a value of 295,800,000 francs; in 1944, 68,800 tons were valued at 728,000,000 francs. Customs receipts for 1944 were 186,100,000 francs, compared with 77,300,000 francs in 1938. A comparison of the foreign trade statistics for the first four months of 1945 with the relative period of 1944 shows a slight decrease in tonnage.

FRENCH EQUATORIAL AFRICA, FOREIGN TRADE

1944		Value
First 4 mos.		
Imports	25,500 tons	266,400,000 francs
Exports	39,000 tons	146,200,000 francs
Total	64,500 tons	412,600,000 francs
1945		Value
First 4 mos.		
Imports	26,800 tons	247,600,000 francs
Exports	29,100 tons	132,200,000 francs
Total	55,900 tons	379,800,000 francs

The chief seaports are Libreville and Port Gentil in Gabon colony, and Pointe Noire in Moyen Congo. A 318-mile railroad line, the only one in French Equatorial Africa, connects Pointe Noire with Brazzaville, whence steamer services proceed up the Congo River. One highway links Fort Lamy with Bangui; and a second connects Brazzaville with Libreville. Two main highways from Douala, in Cameroun, traverse the country. The northern road runs northeast to Fort Lamy, just below Lake Chad, and continues eastward through Chad colony, crossing the Darfur Province of the Anglo-Egyptian Sudan to reach Khartoum; roads from Takoradi, in the Gold Coast, and from Lagos, in Nigeria, meet this highway at Fort Lamy. The southern road from Douala traverses Oubangui Chari colony and enters the Anglo-Egyptian Sudan through Equatoria Province, continuing to Juba on the Nile. Telegraphic communications, both wireless and land-line, were greatly expanded during the war.

French Equatorial Africa became, in August 1940, the first of all French territories in Africa to give its support to the French Committee of National Liberation. Prime mover in this step was Felix Eboué, Negro governor of Chad colony, and subsequently appointed governor general of the federation which he placed on a war footing. Governor Eboué also instituted radical reforms, including decentralization of the administration.

He died at Cairo in 1944. On May 17, 1945, the anniversary of his death, a religious memorial service was held for him at Brazzaville, troops marching past the catafalque on the parvis of the cathedral. Construction of two great air bases at Brazzaville and Fort Lamy is planned. Though at present commercially far less important than French West Africa and France's Mediterranean coast possessions, French Equatorial Africa seems destined to play a much greater role in coming decades by reason of its strategic situation. In an airplane-dominated world the truth of the dictum of a great 19th century French colonial soldier and administrator, "Who controls Chad, dominates Africa," seems less than ever debatable.

FRENCH GUIANA or GUYANE FRANCAISE.

French colony on the north coast of South America; area about 35,000 square miles (including the separate hinterland territory of Inini, area 30,301 square miles, pop. 6,099), and a population (European or assimilated, as of 1936) of 37,000. This does not include the transient mining population, government officials, troops, numerous Indian tribes of the interior, or the penal settlements. Cayenne, the capital, has 11,704 inhabitants. The climate, bad near the coast, is reported to be healthful in the attractive but little known interior. The colony is administered by a governor assisted by a Privy Council and an elected Council General similar to such assemblies in France. The country is divided between 14 municipalities; all the inhabitants are French citizens. The colony sends one deputy to the French Parliament. Primary education is free. Educational facilities also include a college, a normal school, several Congregational schools, and private schools. In 1943-44 the colony had a school population of 3,469 in addition to 125 pupils in three schools in the penal settlement. There is little agriculture, principal crops being rice, corn, manioc, cacao, bananas, and sugar cane. Subsistence farming has been neglected and foodstuffs must be imported because of the populace's concentration on the search for gold. There are immense forests rich in valuable timber, including Inini's rose wood and cabinet wood. The most important industry is placer gold mining; raw gold long accounted for about 90 per cent of the colony's exports. Chief imports are textiles, petroleum products, staple foods and drugs; chief exports are cacao, bananas, woods, fish glue, rum, balata, gold, and hides. Imports for the first half of 1944 were valued at 68,392,000 francs, compared with 29,895,000 francs for the same period in 1943, and 33,300,000 francs in 1938. Exports for January through June 1944 were valued at 17,527,000 francs, compared with 14,023,000 francs in 1943 and 24,100,000 francs in 1938. The budget for 1945 balanced at 64,462,051 francs. There are three ports, Cayenne, St. Laurent, and Oyapock, with steamboat communication between them and inland villages on the rivers. Cayenne and St. Laurent are visited monthly by French packet boats, and Cayenne weekly by planes on the Trinidad-Brazil route of Pan American Airways. The penal settlements (founded 1854) on the Maroni River and islands near Cayenne (including Devil's Island) were to have been discontinued within 15 years after 1936. In 1938, owing to overcrowded conditions in French prisons, additional prisoners were sent to Guiana, which in 1943 had a convict population of 2,404. On March 6, 1944, the French Committee of Na-

tional Liberation, at Algiers, re-established Devil's Island as a prison for persons convicted of political crimes. However, in the same year the French government decided to disestablish the penal settlements. The work of liquidation has begun, and in a few years the penal administration will have left the continent.

FRENCH GUINEA. See FRENCH WEST AFRICA.

FRENCH INDIA. A colony of France in the peninsula of India. The colony consists of five widely dispersed units (*Dépendances*) which constitute enclaves within British India. The aggregate area of the colony is 196 square miles, and at the census of 1941 the population numbered 323,295. Chandernagor (pop. 38,284) is situated on the Hoogly, north of Calcutta, and along the east side of the peninsula, from north to south, lie Yanaon (5,711), in the Godavery delta, Pondichéry (204,653), on the Coromandel coast, and Karikal (60,555), in the Cauvery delta; and on the west side lies Mahé (14,092), on the Malabar coast. The ports through which most of the foreign trade of French India pass are Pondichéry (53,101) and Karikal (19,363), chief towns of the *dépendances* of those names; Yanaon and Mahé are minor ports. Pondichéry is capital of the colony, the governor of which is N. E. Jeandin whose administration began June 17, 1945. French India joined General de Gaulle's French Committee of National Liberation on Sept. 9, 1940. There is an elective General Council, and administratively the colony is divided into 17 communes, all organized as municipalities. The colony sends one deputy to the French Parliament. All the people have the suffrage. Hindustani and Urdu are the native tongues. The 1943 budget showed 3,274,860 rupees for revenue, against an expenditure of a like amount. In the 67 primary schools and four colleges, all maintained by the government, there were, in 1942, 13,319 pupils with 371 teachers. In 1938 the budget for public health services amounted to 5,000,000 francs. Principal crops are rice, manioc and peanuts. Livestock included (1942) 35,563 cattle, 23,024 sheep, and 17,700 goats. There are three cotton mills at Pondichéry, with 87,524 spindles; and there are also a few oil presses for peanuts, an ice factory, a jute mill, and two bone mills. Textiles are the chief export. When, after the collapse of France in 1940, these exports could no longer go to French colonies, and imports from Metropolitan France became unobtainable, French India found herself in a serious economic situation. Her difficulties were removed when an agreement was reached on Jan. 28, 1941, for a customs union with British India with effect from Feb. 15, 1941. Exports to and imports from British India now became possible, thus removing barriers that had hindered the colony's progress for over a century, and by the terms of the agreement the Customs Department of British India paid the colony the sum of 600,000 rupees annually. This amount, which was supplementary to normal budgetary revenue, enabled French India to maintain payments of pensions and other obligations. Unemployment disappeared and the fiscal years of 1940 and 1941 closed with surpluses. The imports and exports at Pondichéry and Karikal in 1942 were valued at 35,749,000 francs and 17,850,000 francs respectively. Railroads with a combined mileage of 43 miles link Pondichéry with Villapuram, and Karikal with Peralam. In Pondichéry is a branch of the Bank of Indo-China.

FRENCH INDO-CHINA. A union of French territories in southeastern Asia. Comprising the colony of Cochinchina, or Cochinchine (finally settled in 1859); the four protectorates of Cambodia, or Cambodge (proclaimed in 1862), Annam, Tonkin, or Tongking (both proclaimed in 1874), and Laos (proclaimed in 1893). The geographically detached territory of Kwangchow (held on a 99-year lease from China since 1898) was considered administratively a part of French Indo-China until Aug. 18, 1945, when the French government formally returned it to Chinese sovereignty. The area of French Indo-China is 285,790 square miles, and the population numbers 24,161,251. While Hanoi is the capital, during the hot season most of the administrative offices are moved to Saigon. On July 20, 1940, Vice Admiral Jean Decoux was appointed governor general by the Vichy regime of Marshal Pétain. After the Japanese occupied the country in 1940-41, Decoux was forced to do their bidding and on March 10, 1945, with other French leaders, was placed in "protective custody," charged with secretly co-operating with the Allies. Later that month Japanese attacks against French troops west of Hanoi were repulsed. The country's liberation was followed on August 17 by the appointment of Admiral Thierry d'Argenlieu as governor general succeeding Admiral Decoux; but the defeat of Japan was the signal for an uprising of Annamites against French rule. The few French contingents available to cope with this revolt were importantly aided by Chinese and British troops. On October 7, Maj. Gen. Jacques-Philippe Leclerc arrived at Saigon with reinforcements, and toward the end of the year, the British and Chinese troops were withdrawing, leaving the French in complete control.

Component	Area, sq. mi.	Population	Capital
Cochinchina (Cochinchine).....	24,900	4,615,968 ¹	Saigon (110,577)
Cambodia (Cambodge).....	69,900	3,046,432 ¹	Phnom-Penh (102,678)
Annam.....	56,970	6,211,228 ²	Hue (28,000)
Tonkin (Tongking).....	44,700	9,264,309 ³	Hanoi (134,849)
Laos.....	89,320	1,023,314 ²	Vien-chuan, or Vientiane (16,000)
Total.....	285,790	24,161,251	

¹ Census of 1936; ² estimate of 1939; ³ estimate of 1940.

The colony of Cochinchina is administered directly by French officials headed by a governor, who is assisted by a Colonial Council; the colony has one deputy in the French Parliament. The four protectorates, all of them native kingdoms, are administered by local officials; in each instance the administration is headed by a French "superior resident," who is assisted by a Protectorate Council and a Council for Economic Affairs. The most important administrative development of the year was the inclusion of Indo-China as a unit of the French Federation, giving it a status corresponding to that of a dominion in the British Empire organization.

Finance.—Each component of French Indo-China has its own budget, which it administers itself; in addition, all contribute to the general expenses of the union, and likewise receive part of certain common revenues. The general budget of the governor generalship for 1941 balanced at 147,948,530 piasters (4.41 Indo-China piasters being the equivalent of one United States dollar). The public debt amounted to 251,589,411 piasters. During the Japanese occupation the piaster became linked with the Japanese yen.

The People.—The largest and most homogeneous racial group in French Indo-China is the Annamites who number about 19,000,000. They inhabit the deltas and coastal plains, the richest

lands, but have so overcrowded these regions which constitute only one fifteenth of the total area of Indo-China that the density is one of the highest in the world, often exceeding 700 inhabitants per square kilometer in the Tonkin delta. The French administration made strenuous and (until the Japanese invasion) successful efforts to colonize the sparsely inhabited central plateau of Annam with Annamites from the overpopulated coast. The native Moi, a primitive warlike race, had first to be persuaded to raise their standard of living by cultivating their lands, and to accept the peaceful Annamites as neighbors. During the decade of 1930-40, the policy resulted in an extensive cultivation of the interior plateau region and even in the establishment of cities like Ban Methuot, with its tourist hotels and thriving commerce. Other races comprise: Cambodians, 3,100,000; Lao, 1,000,000; and Moi, Kha and Meo, 600,000. There are some 435,000 Chinese in the union; and Europeans, mainly French, number 42,260.

Education and Public Health.—The system of education for French children resembles that of France: in 1939 there were 33 elementary schools with 5,504 pupils; 6 higher elementary schools for boys and girls with 792 pupils, and 3 lycées at Hanoi, Saigon and Dalat with 1,930 pupils. For native children there were in 1939, 7,141 primary and elementary schools with 519,000 pupils and 12,200 teachers; 19 higher elementary schools with 5,640 pupils; and 4 secondary schools with 550 pupils. There were also 47 professional schools with 2,630 pupils. The University of Hanoi (organized 1917) consisted of a faculty of medicine with 262 students, of whom 25 were French; a faculty of law with 311 students, including 54 French; and a faculty of fine arts with 50 students. The

French Far Eastern Institute maintained two museums and a library in which were 20,000 French and 36,000 Chinese books, some extremely rare. State hospitals provided accommodation for 400,000 patients yearly, and out-patients numbered 13,708,000. Pasteur Institutes have developed curative and preventive procedures for the principal diseases, especially malaria to which Annamites of the coastal plain who move to the plateau regions are particularly susceptible.

Production.—French Indo-China ranks third among the world's rice-growing countries, the average annual production amounting to 6,300,000 tons; most of it is grown in Cochinchina, Cambodia, the southern part of Laos, and Annam south of Cape Varella. Other important agricultural products are wheat (623,000 tons) and rubber. In the prewar decade rubber experienced a boom. From only 6,000 metric tons produced in 1925 the production increased to 58,000 metric tons in 1938. Rubber stocks, evenly distributed throughout the country, are reported to be practically intact. Lesser crops include pepper, spices, tea, sugar, copra, kapok, jute, cotton and peanuts. The forests yield hardwoods, bamboo, herbs and essential oils. Fish is an important staple of native diet. The coal mines of Tonkin produce a high grade of anthracite, the

output in 1939 amounting to 2,615,000 metric tons; zinc, tin, wolfram, tungsten and iron ore are also mined. By 1936 12,355,000 acres of land had been brought under irrigation, and the French administration continued an expansion program in order to resettle large numbers of people from the over-populated delta regions. Nearly 60,000 kilowatts of electric power were derived from hydroelectric and other installations. Industries on a small scale included the manufacture of cement, laces, glass and pottery, leather, matches, fish sauces and cigarettes.

Foreign Trade.—Nearly half of the external commerce of the union before the war was with France, other markets being Hong Kong, the United States, Singapore, China and Japan. Rice and rubber were the principal exports, and others included fish, coal, cattle and hides, wheat, pepper, zinc and tin; the chief imports were cotton and silk goods, metalware, petroleum products, and automobiles. In 1939 the exports were valued at 3,494,724,000 francs, and the imports at 2,382,262,000 francs. Most of the overseas trade was with Japan after enemy occupation of the country. During that period production of all major export commodities dropped to the lowest levels, with the single exception of rice. Prior to the war the rice export to Japan had diminished annually from the beginning of the century until in the period 1933–38 only 2 tons were shipped. In 1941, however, Japan imported 854,577 tons, 905,401 tons in 1942 and 978,699 tons in 1943 when she absorbed all but about 18,000 tons of the Indo-Chinese production. During the last years of the war Indo-China became Japan's richest rice granary.

Communications.—Before the war there were 2,093 miles of railroads, which linked all important centers and extended to Yunnan (Kunming), in China; subsequently, the line northwest of Pnom-Penh was continued to connect with the Siam railroad system. Some 10,800 miles of the 18,000-mile highway system were paved before the war, and the mileage of all-weather roads was considerably increased by the Japanese for military purposes.

Principal Events of 1945.—On May 24, 1945 General de Gaulle, as head of the provisional government of the French Republic, declared: "The Indo-Chinese Federation will enjoy in the frame of the French Union an economic autonomy allowing it to attain its full agricultural, industrial, and commercial development and to realize in particular the industrialization which will permit Indo-China to cope with its demographic condition. Thanks to this autonomy, and freed from all discriminatory regulation, Indo-China will develop its commercial relations with all other countries and notably with China, with which Indo-China, like the rest of the French Union, expects to have close friendly relations." After Japan's surrender in August, British and Chinese troops entered the country from the south and the north as a temporary measure to disarm the Japanese occupants, pending the arrival of French forces.

FRENCH IVORY COAST. See FRENCH WEST AFRICA.

FRENCH LITERATURE. See FRANCE—*The Literary Balance Sheet*.

FRENCH NAVY. See NAVAL PROGRESS.

FRENCH OCEANIA. The groups of islands scattered over the eastern Pacific which constitute a single colony under the name of French

Establishments in Oceania. The total area of the "French Establishments" is 1,520 square miles, and the population on Nov. 1, 1941, was 51,221. The Society Islands, most important of the constituent groups, contain Tahiti (600 square miles; pop. 23,133), the chief town of which island, Papeete (pop. 11,614), is the capital of the colony; another of the Society Islands is Moorea (50 square miles; pop., 2,279). Other principal groups or single islands within the colony consist of the Marquesas (pop. 2,699), Tuamotu group (4,681), Leeward Islands (11,891), Gambier (1,504), Rapa (3,621), Makatea (1,248), and Maiao (165). Clipperton Island, some 700 miles southwest of Mexico, is administered as part of the colony. Advisory councils assist the governor of the colony. The 1941 budget balanced at 28,800,000 francs.

On Tahiti and some other islands are extensive coconut plantations; other agricultural crops are sugar cane, vanilla, and a variety of vegetables and fruits. The chief industries are the making of copra, sugar and rum, and the production of phosphates. Shallow waters around Tahiti yield pearls and mother-of-pearl. Exports of French Oceania in 1944 were 223,900 tons valued at 179,900,000 francs, as compared with the 1938 figures of 135,000 tons valued at 47,600,000 francs. The 1944 imports amounted to 30,400 tons valued at 172,600,000 francs, as compared with 1938 imports of 22,000 tons valued at 63,200,000 francs. French Establishments in Oceania was the first of the country's colonies to repudiate the Vichy regime and give its support to General de Gaulle.

FRENCH SOMALILAND. A colony of France, on the gulf of Aden in northeast Africa, between Italian East Africa (Eritrea) and British Somaliland. It reaches inland a distance of 56 miles and has an area of 9,071 square miles. The population (estimated July 1, 1944) of 40,100, includes about 14,056 Somalis, 21,546 Danakils, 3,392 Arabs, and a few hundred each of Jews, Ethiopians, and Hindus, with about 627 Europeans (480 French) in Djibouti, the capital, which has a total population (1944) of 10,421. The colony is ruled by a governor and an Administrative Council. The budget for 1944 balanced at 48,000,000 francs. In 1938 there were 19 schools (13 Islamic, 4 French, 1 Hindu and 1 Jewish) with 938 pupils. In the same year the public health services expended 1,300,000 francs. Salt mining and coast fishing are the main industries. There are said to be deposits of gypsum, mica, amethyst, sulphur, and petroleum. Imports (chiefly cotton goods, coal, cattle, and sugar) for the year 1944 had an estimated value of 333,600,000 francs; exports (coffee, ivory, hides and skins, salt, and animal wax) for the same period were valued at 214,000,000 francs. Reckoned in number of tons handled, imports for 1944 amounting to 63,600 tons were not far below the 1938 tonnage of 68,100. Exports for 1944 amounting to 78,500 tons, were, however, little more than half the 1938 tonnage of 140,300. Much of the colony's external commerce had been in transit trade, Djibouti being connected by a railway nearly 500 miles long with Addis Ababa, the Ethiopian capital. In 1943 the transit trade had a value of 400,000,000 francs. In the same year, and also in 1944, Britain and her possessions enjoyed a larger share of the trade than did France and her possessions.

On Dec. 29, 1942, following the occupation of Italian East Africa by the British and the res-

toration of Ethiopia as an independent state, French Somaliland joined the Fighting French.

FRENCH SUDAN. See **FRENCH WEST AFRICA.**

FRENCH TOGO. See **TOGO, FRENCH WEST AFRICA.**

FRENCH WEST AFRICA. A federation of eight colonies and one mandate extending, west to east, from the Atlantic Ocean and the frontiers of the Spanish colony Rio de Oro to French Equatorial Africa; on the north it is bounded by Algeria and Libya; and on the south it borders the Gulf of Guinea. The total area is 1,836,560 square miles, and the population in 1940 amounted to 15,767,892 (33,961 Europeans, of whom 25,551 were French). Dakar is the seat of the federal administration, which is headed by a governor general. The federated colonies constituting French West Africa are as follows:

	Area sq. mi.	Popula- tion	Colonial capital
Senegal	77,600	1,698,000	St. Louis (33,589)
Mauritania	322,000	383,000	(1)
French Sudan ...	592,000	3,635,073	Bamako (32,761)
Guinea	96,900	2,065,527	Conakry (10,000)
Ivory Coast	184,000	3,981,459	Abidjan (26,143)
Dahomey	43,200	1,289,128	Porto Novo (27,483)
Niger	499,000	1,809,576	Niamey (3,000)
Dakar (and cir- cumscription) ..	60	126,129	Dakar (100,003)
Togo (mandate) ..	21,800	780,000	Lomé (14,380)
Total	1,836,560	15,767,892	

¹ Administrative headquarters of Mauritania are at St. Louis, Senegal.

The governor general of French West Africa is assisted by a council; each colony is headed by a governor or lieutenant governor, in some instances aided by a colonial council. There is a general budget for the federation covering expenditures on transportation services, other works of general interest and social services, revenue being derived from the customs and shipping dues of the colonies; other revenues of the colonies finance separate colonial budgets for local expenditures. The fiscal year runs from October 1 to September 30. The general budget for 1944-45, as made executory together with its annexed budgets, amounted to 3,253,856,860 francs. The 1945-46 general budget was 1,445,517,000 francs. In 1936-37 there was a total school population of 68,310, of whom 10,848 were in private schools, and 350 in Moslem schools. The state school system, in addition to numerous rural and urban primary schools, included 7 higher primary, 2 secondary, and 13 technical schools. Principal agricultural products are peanuts, coffee, cacao, cotton and bananas. Imports are mainly textiles, fuel oil, machinery, foods, and beverages. Leading agricultural exports in 1944 to North Africa and the United Nations in order of tonnage were peanuts and peanut oil, palm kernels and palm oils, cacao, rubber and copra. The 1944-45 peanut crop, the principal factor in the export trade, had been expected to amount to 400,000 metric tons, but only 280,000 were marketed, due largely to adverse weather conditions. The target set for the 1945-46 crop is 500,000 tons of unshelled peanuts. All the 1943-44 rubber, copra and sesame production was sold to the Allies. The normal rubber production is small. West Africa produced 6,000 tons in 1944, nearly all wild rubber;

after September of that year the entire production was shipped to the United States. In 1944 a bauxite deposit described as "practically inexhaustible" was discovered in Guinea. Diamond production in 1944 amounted to 60,000 carats, compared with 35,000 carats in 1943. This increase was due to the much higher price paid by British buyers.

Dakar, considered one of the less important French ports before the First World War, by 1938 had risen to fourth place, ship clearances that year numbering 3,433. After Germany's defeat in May 1945 the French government immediately prepared plans for Dakar's development as a major naval and aviation base. These will soon result in its becoming, like Gibraltar, Suez and Panama, one of the great world security bases.

French West Africa has no important manufacturing industries, but there are a few domestic industries processing agricultural products to produce peanut oil, soap, bags and shea oil. A fisheries bureau was established in 1942; it promises an increasing postwar development.

Railway mileage totals 2,724 and consists of several unconnected lines, of which the chief is the Dakar-Niger line. As in metropolitan France the end of the war with Germany revealed a transportation crisis. Of 323 locomotives, 50 were unrepairable, and a third of the remainder were being repaired. The situation was somewhat alleviated by the arrival of 14 powerful American locomotives.

On Jan. 13, 1945, the French opened West Africa to private trade with the United States. A three-day economic conference was held in February at Dakar, attended by the chiefs of the economic services of the West African colonies and presided over by Governor General Digo. On April 30 the fair of the Dakar Exposition opened with exhibits showing the war effort made by the federation.

FRIENDLY ISLANDS. See **WESTERN PACIFIC ISLANDS, BRITISH, Section 3.**

FRIENDS, The Religious Society of. The Religious Society of Friends (Quakers) is a spiritual movement founded by George Fox in England in the middle of the 17th century. Its central doctrine, is that the Light of Christ dwells in each individual and requires a way of life, which emphasizes equality, simplicity, sense of community and non-violence in all relationships. In methods of worship Friends meet in an atmosphere of quiet reverent waiting under the leadership of the Divine Guidance without the aid of liturgy, sacrament or formal program. While there are recorded ministers in the society, lay members also participate in the ministry.

The Society of Friends is composed of 54 Yearly Meetings and organized groups in 30 countries with an approximate membership of 164,000. In the United States and Canada there are now 27 Yearly Meetings with a total membership of 113,000. Eleven of these Yearly Meetings belong to the Five Years Meeting with headquarters at 101 South 8th Street, Richmond, Ind. *The American Friend* is their official publication. Six of the Yearly Meetings belong to the Friends General Conference with headquarters at 1515 Cherry Street, Philadelphia, Pa.¹ The others are independently organized.

The American Friends Fellowship Council, 20 South 12th Street, Philadelphia, Pa., co-operates

¹Their official publication is *The Friends Intelligencer*.

with all groups of Friends in the United States and Canada and directs the Wider Quaker Fellowship for persons belonging to other religious groups who desire a closer affiliation with Friends. The Friends World Committee for Consultation draws all groups of Friends together in its European, American and Far Eastern Sections.

The American Friends Service Committee, Philadelphia, Pa., renders a service of relief and rehabilitation. Through the Foreign Service Section, food, clothing and medicine has been distributed to thousands in need in France, Italy, India and China. A service to refugees has been conducted in Spain, Portugal, North Africa, as well as in this country. The Social-Industrial Section has made special studies of conditions among the miners and sharecroppers, studies of race relations, and rendered special services to Japanese-Americans in their relocation. The Peace Section has conducted a series of International Institutes and Seminars. Friends have co-operated with Mennonites, Brethren and other church agencies in Civilian Public Service for Conscientious Objectors. Of the 10,000 men in Civilian Public Service Camps about 2,000 are under the care of Friends. They have engaged in manual labor in forestry and soil conservation projects, served as human "guinea pigs" in medical research and as attendants in mental institutions.

In all these ways Friends strive to exemplify

their faith in the oneness of religion and life.

LESLIE D. SHAFFER,
Secretary, American Friends Fellowship Council.

FRUITS. See APPLES; CITRUS FRUITS; PEACHES; PEARS, etc.

FUELS, Synthetic Liquid. See MINES, U. S. BUREAU OF.

FULLER'S EARTH. A rapid recovery in the production of fuller's earth is under way, according to the United States Bureau of Mines. Owing to heavy competition from activated earths and synthetic substitutes, fuller's earth steadily lost ground after 1930. But wartime demands for petroleum products, shortages of competitive materials, and new absorbent uses all contributed to the recovery that nearly reached record levels. Only in 1929 and 1930 was volume higher.

Fuller's earth sold or used by producers in 1944 was 294,737 short tons valued at \$3,-297,064, as compared with the 247,258 tons valued at \$2,664,027 of 1943 and the 204,244 tons valued at \$2,139,670 of 1942. The average value per ton of fuller's earth produced in the United States rose from \$10.77 in 1943 to \$11.19 in 1944.

GALAPAGOS ISLANDS. A group of 12 large and several hundred small islands, officially known as the Archipiélago de Colón (Columbus Archipelago), comprising a territory of Ecuador in the Pacific Ocean, 650 miles west of Ecuador proper. They take their name from the giant tortoises, called *galápagos* in Spanish, which inhabit the islands. The total area has been estimated at from 2,868 to 3,028 square miles, with a population (1941) of 2,156. Since Charles Robert Darwin's visit aboard the *Beagle* a century ago the islands have been aptly termed a zoologist's paradise, owing to the great number of unique species discovered by every scientific expedition. By arrangement with Ecuador some of the islands were fortified and used as air bases by the United States during the war, for defense of the Panama Canal. After Japan's surrender negotiations were undertaken looking toward acquisition of these bases by the United States either by sale or long-term lease.

GAMELIN, Maurice Gustave, French Army officer: b. Sept. 20, 1872. General Gamelin was named supreme commander of French troops on June 6, 1939, and later of British Expeditionary Forces. On May 19, 1940, he was replaced by Gen. Maxime Weygand, after the numerically superior German forces broke through the French defenses. In early September 1940, he was in-

terned by the Vichy government. He was formally arrested on November 17, and imprisoned. Berlin announced on April 5, 1943, that he had been taken to a German prison by Nazi authorities to prevent the establishment of a counter-government under Allied sponsorship. With several other prominent Frenchmen, General Gamelin was freed by American troops on May 5, 1945, after months of imprisonment at Itter Castle, Austria. The 73-year-old officer is the son of a general and a graduate of St. Cyr. In the First World War, he distinguished himself in the battle of the Marne. In 1938 and 1939, as Europe approached total war, he was responsible for partial mobilization of French forces. He was one of the French leaders who urged intervention in the German-Czechoslovak crisis, despite his nation's unpreparedness.

GAS, Manufactured, Mixed and Natural. According to figures made public by the American Gas Association, the gas utility industry's revenue from all classes of sales totaled \$1,146,216,000 in the 12-month period ending Sept. 30, 1945, a gain of 3.6 per cent over revenues of \$1,106,-894,300 in the corresponding period ended a year earlier. Revenues from the sale of gas for residential purposes in the 1944-45, 12-month period amounted to \$720,261,800, as compared with \$690,427,800 in 1943-44, an increase of 4.3 per cent; commercial sales in 1944-45 totaled \$130,760,600 as compared with \$121,710,800 in the earlier year, a gain of 7.4 per cent; industrial sales aggregated \$288,201,800 in 1944-45 as compared with \$286,468,800 in 1943-44, a gain of 0.6 per cent.

On Sept. 30, 1945, the gas industry was serving 19,930,600 customers, an increase of 1.6 per cent over the 19,612,500 served a year earlier. Residential consumers numbered 13,800,400, as against 13,532,000 a year earlier, an increase of 1.4 per cent; commercial customers, 1,032,500 in 1945, 986,200 in 1944, an increase of 4.7 per cent; and industrial customers, 85,500 against 82,600 an increase of 3.5 per cent. Sales of manufactured and mixed gas in the 12-month period ended Sept. 30, 1945, totaled \$452,992,500; sales of natural gas, \$693,223,500 in the same period.

GAY, Maisie, English actress: b. London, Jan. 7, 1883; d. Kingsdown, England, Sept. 13, 1945. Maisie Gay was a noted musical comedy star of American, Australian, and British productions for over 40 years. Educated in Germany and at the North London Collegiate School, Miss Gay made her stage debut at Blackpool in 1903 in the chorus of *The Cherry Girl*. The following year she joined George Edwardes' company on tour in *A Country Girl* and subsequently succeeded to the leading part of Nan, a role which she played more than 1,000 times between 1904 and 1907. She made her London debut in 1908 as Fifi in *The Waltz Dream* and three years later appeared for the first time in the United States as Madame Blum in *The Quaker Girl*, which opened at the Park Theater in New York on Oct. 23, 1911. The next year she appeared as Maisie Green in *Phyllis* at the Cort Theater in Boston, and in 1914-15 toured as Adelaide Fontaine in *High Jinks*. She returned to the United States in 1922 to appear in *Pins and Needles* at the Schubert Theater in New York. During the next years she appeared in many English revues, including *Snap* (1922), *London Calling* (1923), *Charlotte's Revue* (1924; 1925), *This Year of Grace* (1928), and *Cochran's Revue* (1930). In 1929 she toured the principal Australian cities, and the next year entered the films and was seen in *To Oblige a Lady* and *The Old Man*. A volume of her reminiscences, *Laughing Through Life*, was published in 1932.

GEIGER, Roy Stanley, United States Marine Corps officer: b. Middleburg, Fla., Jan. 25, 1885. Lieutenant General Geiger was chief field commander of the United States Marine Corps during the final weeks of the Pacific war. At the time he was appointed to this post, he was directing American forces in the Okinawa mop-up, having taken over after the death of Lieut. Gen. Simon B. Buckner, Jr. (q.v.); he went to Pearl Harbor on June 30 (1945) to assume his duties as commanding general of all Fleet Marine forces in the Pacific Ocean areas. General Geiger was Marine General Vandegrift's air officer on Guadalcanal, and for his work with aviation units in that theater, from September to November 1942, was awarded the Gold Star in lieu of a second Navy Cross. He succeeded General Vandegrift as commander of marine forces in the Southwest Pacific on Nov. 9, 1943. He was later chief of the 3d Marine Amphibious Corps. General Geiger joined the Marine Corps in 1907. One of the service's most thoroughly trained officers, he is a distinguished graduate of the Command and General Staff School (1925), the Army War College (1929), and the Naval War College (1940). He completed his aviation training at Pensacola, Fla., in 1916. He holds the Navy Cross for his First World War service. He was promoted lieutenant general, June 19, 1945.

GEM STONES. According to the United States Bureau of Mines, the value of uncut stones, from domestic sources, used in jewelry and related industries, approximated \$41,000 in 1944, which was substantially lower than the \$67,000 and \$150,000 reported in 1943 and 1942 respectively. The professional gem miner sought strategic minerals; the amateur collector did not have gasoline or tires to pursue his hobby; and the tourist, principal purchaser of domestic gem stones, was almost nonexistent. As producers, the leading states ranked as follows: Arizona, Wyoming, Colorado, Washington, Montana, and Oregon. Turquoise was the leading gem produced, its value being about \$17,000. Agates, jaspers, and related quartz minerals probably were next in importance. It was reported that from 3,000 to 4,000 pounds of jade (nephrite) were mined in the Lander, Wyo., field. The Montana sapphire industry had a poor year: the single mine that was operating produced about 4,500 ounces of culled sapphire, primarily for industrial use.

Although 1944 was not quite as good a year in the diamond industry as 1943, it was much better than might be expected under wartime circumstances. Because of the war, accurate statistics of diamond production are not available, but reliable estimates indicate an approximate world production in 1944 of 11,500,000 carats valued at about \$40,000,000. This increase in caratage over the 8,351,957 carats in 1943 was due largely to the greater production of crushing bort from the BCK mines in the Belgian Congo; to expansion of output in Sierra Leone, the Gold Coast, and the South West African alluvial mines; and to an appreciably larger production in the South African pipe mines. Of the total, some 80 per cent was industrials and 20 per cent gem stones. The demand for both was excellent in 1944 and stocks continued to decrease, consumption again exceeding production, particularly of industrial grades. The American retail trade prospered in 1944 and diamond sales probably reached a peak, topping those of 1943 slightly.

The emerald mines of Colombia were not operated in 1944. The Burmese, Siamese, and Indo-Chinese gem mines (largely sapphire and ruby) may have been operated on a small scale by the Japanese. Ceylonese mines were bled of labor by the island graphite mines. The production of these gems therefore was small in 1944.

Imports of precious and semiprecious (real and imitation) stones, exclusive of industrial diamonds, in 1944 totaled \$77,529,806, 8 per cent more than in 1943. Total imports of diamonds in 1944, with 1943 figures in parentheses, were: rough or uncut 896,547 (751,240) carats, valued at \$43,445,219 (\$37,443,240); cut but unset 169,097 (193,701) carats valued at \$29,263,121 (\$31,458,089).

GENERAL EDUCATION BOARD, The. An institution incorporated by an act of Congress in 1903, with the stated object of promoting education within the United States of America without distinction of race, sex, or creed. The present program of the board is restricted almost entirely to the support of educational work in the Southern states.

The board is empowered to spend the income and the principal of its funds. Among its appropriations in 1945 were: \$70,000 to the University of Alabama for its public administration program,

of which amount \$30,000 is for the support of the Bureau of Public Administration and \$40,000 for advanced regional fellowships in public administration; \$95,000 to the Phelps-Stokes Fund, New York City, toward a program for the Negro rural church, including the training of Negro rural ministers; \$24,700 to the George Peabody College for Teachers, Nashville, Tenn., toward support of a Regional Materials Service in connection with the movement to have education play a more vital role in the development, understanding, and utilization of the natural and institutional resources of the South; \$76,900 to be apportioned among the universities of North Carolina, Arkansas, Virginia, the American Council on Education, Alabama State Department of Education, and Alabama Polytechnic Institute, for preparation and testing of educational materials dealing with the natural and other resources of the South; \$19,470 to the University of Kentucky toward a study of the actual and potential utilization of the forest resources of the eastern Kentucky highland region; \$45,000 to the Southern Highland Handicraft Guild and \$25,000 to the University of Tennessee toward the support of a program of craft education in the southern highlands; \$20,000 to Harvard University for visiting fellowships in the Graduate School of Business Administration for faculty members of southern institutions; \$30,000 to the Nashville School of Social Work toward its support for a three-year period; \$25,000 to Our Lady of the Lake College, San Antonio, Texas, toward the support of its Graduate School of Social Service; \$25,000 to the United Negro College Fund, Inc., to aid in the raising of a fund for the maintenance of privately supported institutions for Negro education; \$15,770 for salaries and traveling expenses of state agents for rural schools for Negroes in the state departments of education of southern states; \$41,000 to the Georgia School of Technology toward the purchase of scientific instruments and equipment; \$25,940 to the University of Chicago for study and development of new-type verbal tests of general intelligence applicable to all children irrespective of social and cultural status; \$15,000 to the Alabama Polytechnic Institute toward support of a program in rural community development; \$14,000 to the Mississippi State Department of Education toward support of summer training courses for white and Negro teachers and health workers in connection with the development in public schools of a coordinated program of health education and health service; and \$6,200 to North Carolina State Department of Public Instruction for a similar purpose.

Officers.—Walter W. Stewart, chairman of the board of trustees; Raymond B. Fosdick, president; Albert R. Mann, vice president and director; William W. Brierley, secretary; Edward Robinson, treasurer; George J. Beal, comptroller; Thomas M. Debevoise, counsel; Chauncey Belknap and Vanderbilt Webb, associate counsel. The offices of the board are at 49 West 49th Street, New York 20, New York.

Director, Office of Publications, The Rockefeller Foundation.

GENERAL FEDERATION OF WOMEN'S CLUBS.
See WOMEN'S CLUBS, GENERAL FEDERATION OF.

GENOCIDE. A newly coined word meaning mass slaughter or extermination of racial and national groups, such as certain Nazi officials are alleged to have carried out against the civilian populations of some of the German-occupied

countries during the Second World War. The word, first used in count 3 of the indictment drawn by the United Nations in October 1945 against the German war criminals, is said to have been coined by Prof. Raphael Lemkin of Duke University. It is derived from the ancient Greek word *genos*, meaning race or tribe, and the Latin *cidere*, meaning to kill.

GEODETIC SURVEY. See COAST AND GEODETIC SURVEY, UNITED STATES.

GEOGRAPHICAL SOCIETY, American. See AMERICAN GEOGRAPHICAL SOCIETY.

GEOLOGICAL SURVEY, United States. Concentrating its industrial as well as its military might on an early conclusion of the war, the United States naturally took further heavy toll of its mineral resources in 1945. Commercial supplies of mercury, chromium, vanadium, tungsten, manganese, etc., vital to the success of modern arms, dwindled to alarmingly low states, while reserves of petroleum, without which the war of aggression could not have been waged, were taxed to the limit, some pools in the ground having been endangered by far too heavy withdrawals. It was the Geological Survey's mission to point the way to replenishment by locating new deposits, particularly of the metals and petroleum, and to advise concerning their recovery and utilization. For the prosecution of its geologic investigations, for its work in the fields of water resources, mineral leasing, and land classification, and for its extensive topographic and other mapping programs, all of which looked to the restoration of a sound national economy, the Geological Survey had more than \$12,500,000 for expenditure during the year, about one-half of which was made available by direct appropriation of Congress and the other half by co-operative agreements with states, counties, and municipalities and by transfer from other federal agencies. The funds thus placed at the disposal of the survey were wisely administered in activities productive of the materials and data needed for war, in the course of which many new techniques and methods were developed that will be of incalculable value in the peaceful years ahead.

Wartime Geological Investigations.—Wartime geology's leading exponent was a section of the survey known as the Military Geology Unit and organized at the outset of hostilities at the request of the army engineers. This unit reached the peak of its efficiency and service in 1945 when the studies of foreign terrain were expanded markedly and 50 members of its staff were dispatched to the theaters of operation either as scientific consultants in combat zones or on assignments connected with operational intelligence. In the peaceful, neighborly climes of other American republics the survey continued its co-operative investigations of mineral deposits. Under the auspices of the State Department and the Interdepartmental Committee for Cultural and Scientific Cooperation, thirteen different mineral commodities were studied in Mexico, Cuba, Chile, Brazil, the Dominican Republics, and Haiti. In the continental United States, mineral fuels investigations looked primarily to obtaining geologic data basic to the search for additional supplies of petroleum and to appraising the potentialities of substitutes for liquid petroleum even though the survey confidently expects to find new sources of supply. The likely sources of substitutes in large quantity are oil shales and the low-rank coals, especially those of the Rocky Mountain states. In the field of metallic minerals emphasis was placed on fun-

damental geologic studies of the principal ore-producing districts in order to provide a proper foundation for future exploration. At the end of the fiscal year field work in 21 major districts was under way, and some of the work already had produced worthwhile results. The project at San Manuel, Ariz., is an example; there the Geological Survey co-operated with the Bureau of Mines in a drilling program that indicated copper reserves of possibly as much as 64 million tons of ore averaging 0.8 to 0.9 per cent of copper, which is a small fraction of a per cent below the 1.0 to 1.1 per cent copper ores worked in large volumes in Utah and Arizona. Many smaller projects, involving work on eight of the so-called strategic minerals, were completed in 1945. Bauxite investigations, begun in 1941 and carried on jointly with the Bureau of Mines, were practically concluded during the year. They increased, by about 10 million tons of ore, the known national reserves of approximately 75 million tons. Fluorspar production also gained impetus from the survey's field work in 15 states, while investigations of other non-metallic deposits, such as talc, clay, and corundum, added to the nation's storehouse of mineral reserves. In discussing mineral reserves, the work of the survey's Alaskan geologists is also deserving of special mention, for their investigations of a large number of mineral deposits in the territory have added immeasurably to the nation's mineral wealth. During the 1944-45 field season their efforts were chiefly directed to studies of petroleum, coal, quicksilver, copper, tin, and zinc, 19 projects in all having been brought to successful conclusion. Along with these studies was continued the work of the specialized unit that compiles the aeronautical pilotage maps and charts from photographs furnished by the Army Air Forces.

Topographical Work.—The survey's principal mapping unit, the Topographic Branch, devoted the major part of its work to the production of maps for the War Department. Prepared from aerial photographs in the Arlington, Va., Chattanooga, Tenn., Rolla, Mo., and Sacramento, Calif., offices of the survey, the maps in manuscript form covered thousands of miles of territory at home and abroad; but chiefly of lands beyond the seas. More than 64,000 square miles of foreign soil were mapped during the year, about 60,000 of them before V-E Day. Similar maps of areas in the United States published during the year included 183 maps of regions designated by the War Department as strategic. A total of 586 quadrangles were thus covered by the survey between the beginning and near-end of the war. Work on the millionth-scale map, a project begun years ago by Great Britain, Russia, the United States and other nations for making a map of the world on a uniform scale, proceeded to the point of preparing for publication Sheets H-14 (Austin), H-15 (Mississippi Delta), I-17 (Savannah), I-18 (Hatteras), K-10 (Mt. Shasta), K-17 (Lake Erie), and L-10 (Cascade Range). Each sheet of the millionth-scale map comprises six degrees of longitude and four degrees of latitude, or an area somewhat smaller than that of the State of Wyoming. Continuing its work on the Transportation Map of the United States, the survey published during the year 14 sheets covering areas in New Mexico and had eight others of parts of North Carolina ready for publication. Topographic surveying was done in 35 of the states. The work was carried on in co-operation with 19 of the states and with the Tennessee Valley Authority. Special projects included 10

maps for use in survey investigations of strategic and critical minerals; 16 in furtherance of flood-control work by the army engineers; and five for irrigation and reclamation projects of the United States Bureau of Reclamation.

Water Investigations.—Through its numerous field offices maintained for the purpose, the Geological Survey continued its investigations of surface and underground waters, more than a third of the overall cost of which in 1945 was born by states and municipalities. Other federal agencies—Office of the Chief of Engineers; Mississippi River Commission, War Department; Bureau of Yards and Docks, Navy Department; and others—provided nearly a million dollars for water resources work that could not be financed by direct appropriation or included in co-operative programs. Records of the stage, quantity, or availability of surface waters were collected at about 5,600 gaging stations distributed throughout every state of the Union and the Territory of Hawaii. These records are used as the basis for constructing, operating, and administering municipal and industrial water supplies, irrigation systems, power plants, flood-control works, and the like. Ground-water investigations, relating to water from which wells and springs are supplied, covered the source, occurrence, quantity, and head of these waters; their conservation and replenishment; their availability and adequacy for domestic, industrial, irrigation, and public supplies, and as watering places for livestock; and the methods of constructing and utilizing wells and of improving springs. In 1945 there were periodic measurements of water levels or of artesian pressure in about 7,000 observation wells. A study of these records will aid in determining the depletion of underground waters caused by the numerous war industries and other war establishments that obtained their supplies from wells, and in providing against possible shortages. Many of the engineers in ground-water work were also assigned to overseas combat zones, in military or civilian capacity, for water-supply work. Nearly 7,000 analyses of water samples were made in the survey's laboratories, many of them representing studies of water supplies for army and navy establishments and for munition plants and housing developments.

Mineral Classifications.—The fiscal year's end showed an increase of 20 per cent over 1944 in mineral classification matters coming before the survey for technical advice, more than 13,000 cases, each involving one to many geologic determinations, having been acted on during the year. In addition, initial or revised definitions of the known geologic structure of seven producing oil or gas fields were prepared and promulgated, increasing the net area so defined in nine public-land states to 1,888,328 acres on June 30, 1945; geologic appraisal was made of 80 unit-plan submissions; and 53 special reports were rendered to the General Land Office on new discoveries of oil or gas on or adjacent to federal lands, including 22 applications for the royalty benefits accorded by law for the discovery of new oil and gas fields or deposits during the national war emergency. Water and power classification work added 110,278 acres of power-site reserves in 22 states and Alaska; maps representing 180 miles of stream valley and 18 dam sites; final action involving hydraulic determination on 267 cases received for report from departmental sources and the Federal Power Commission; and water-power classification on 1,939 cases, which also involved mineral classification. A marked increase was al-

so recorded in the survey's mineral lease supervision on public lands. More than 7,000 oil and gas properties were under supervision at the end of the fiscal year, aggregating 4,596,053 acres in 20 states and Alaska, an increase of 32 per cent in the number of properties and nearly 48 per cent in the average acreage under supervision at the close of the previous year. Drilling on public lands included the spudding of 566 wells, and the completion of 626 wells, 440 of which were productive of oil and gas and 186 of which were barren. The production of potash was maintained at a high level, and sodium plants ran at maximum capacity to meet war-induced demands for chemical products used in the manufacture of bombs, percussion caps, shells, smokeless powder, etc.

Publications.—The survey's publication work was stepped up from 804 publications in the previous fiscal year to 852 in 1945. The number included one professional paper, 13 bulletins, and 24 water supply papers in the regular series of reports, a number of miscellaneous publications, and a variety of maps, among which the preliminary maps of the oil and gas investigations series should be specially mentioned. These are the result of the program of regional geologic studies, begun in July 1943, in many states where there were possibilities for the discovery of new supplies of petroleum and natural gas. They were released at a rate of approximately four each month. At the close of the year 35 preliminary maps and nine preliminary charts in the oil and gas and war minerals investigations series had been issued. A total of 2,396,731 publications of all types was received and 1,228,424 were distributed. Lastly, a number of unusual devices were made during the year in the survey's shops that supply the scientific and technical staffs with necessary instrumental equipment. Among these were a Graph Subdivider, a Tick Graduator, a Stereo Plotter, and an attachment for aerial continuous strip camera whereby distortions in a photograph are largely eliminated. The subdivider is used to convert graphical records of the gage heights of rivers into figures representing the daily mean discharge. The Tick Graduator divides the distances between degree lines on map grids into 60 equal parts representing minutes, and cutting the graduations (called "ticks") through the photographic emulsion on glass plates. The Plotter portrays on maps contour lines derived by the floating dot method from vertical aerial photographs.

GEOPHYSICS. See under PHYSICS.

GEORGIA. South Atlantic state, United States; one of the original thirteen states. Population (1940): rural, 2,049,915; urban, 1,073,808; total, 3,123,723. Land area, 58,518, divided into 159 counties. Principal cities, with 1940 populations: Atlanta, the capital, 302,288; Savannah, 95,996; Augusta, 65,919; Macon, 57,865; Columbus, 53,280.

Chief State Officers, 1945.—Governor, Ellis G. Arnall; secretary of state, John B. Wilson; treasurer, George B. Hamilton; comptroller, Homer C. Parker; attorney general, T. Grady Head.

Judiciary.—Chief Justice of the Supreme Court of Georgia, R. C. Bell; associate justices, W. H. Duckworth, W. Frank Jenkins, Lee B. Wyatt, Warren Grice, William Y. Atkinson.

Legislature.—Georgia's General Assembly (Senate, 52 members; House of Representatives,

205) meets biennially in odd years on the second Monday in January.

Education.—At last report (1943-44), there were 3,613 public elementary schools in the state, with 16,415 teachers and 593,776 pupils. The average yearly salary of elementary school teachers was \$781. There were 1,402 schools with high school grades, employing 6,339 teachers and enrolling 134,681 students. High school teachers earned an average yearly salary of \$1,195. Education in Georgia is compulsory for all children between the ages of 6 and 16, inclusive.

Finances.—Following is a statement of finances for the fiscal year 1944-45, supplied by the state treasurer's office:

Balance in treasury, beginning of fiscal year 1944-45.....	\$26,380,641.59
Receipts, 1944-45.....	64,077,071.91
Total	\$90,457,713.50
Disbursements, 1944-45.....	57,917,302.11
Balance, beginning of fiscal year 1945-46	\$32,540,411.39

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.).....	43,561	40,802	46,467
Oats (1,000 bu.).....	8,644	13,080	14,700
Wheat (1,000 bu.).....	1,824	2,964	2,821
Barley (1,000 bu.)....	112	200	209
Rye (1,000 bu.).....	146	170	162
Cotton (1,000 bales)...	972	810	615
Hay:			
Tame (1,000 tons)...	645	688	831
Pecans (1,000 lb.)....	21,538	33,500	38,500
Peanuts (1,000 lb.)...	472,918	683,620	734,300
Sweet potatoes (1,000 bu.)	8,018	8,272	8,742
Tobacco (1,000 lb.)...	70,679	93,780	109,215
Potatoes (1,000 bu.)...	1,451	1,363	2,052
Peaches (1,000 bu.)...	4,997	4,590	8,091
Pears (1,000 bu.).....	347	500	502
Grapes (tons)	1,690	2,200	2,300

GEORGIAN SOVIET SOCIALIST REPUBLIC. See UNION OF SOVIET SOCIALIST REPUBLICS.

GERMAN MEASLES. See MEDICINE.

GERMANY. Germany today is a joint American-British-Russian-French occupation area, lacking the prerogatives and characteristics of a sovereign nation. It has no central government or any national authority entitled to designate such a government, no national administration, legislature, or executive. Even its national borders are not clearly defined. Germany's present status is supposed to last for an indefinite period, originally planned for some decades, but which might be reduced to two years. Thereafter, a restoration of a sovereign German state is in prospect, with Allied occupation forces to be withdrawn or confined to certain vital districts. Neither the constitution of a future Germany nor possible restrictions to be imposed upon its government have been disclosed as yet.

Area and Population.—Through the act of unconditional surrender on May 7, 1945, Germany was reduced to the area it occupied before March 11, 1938. This territory amounted to 181,660 square miles, with a population of 69,622,483. Then, by the terms outlined at the Potsdam Conference, all territory east of the Oder and Neisse rivers, including all of East Prussia and Silesia, most of Pomerania, and a small slice of Brandenburg, was taken from Germany. The northeastern part of East Prussia, with the port of Königsberg,

is to go to the Soviet Union. All the rest of this eastern area carved from Germany is to become Polish. Germany is thus deprived of territory covering roughly 43,280 square miles—23 per cent of the Reich as it existed in 1938—with 9,600,000 prewar inhabitants—13.5 per cent of the 1938 total. The French are advocating internationalization of the Ruhr and permanent severance of the Saar and the Rhineland from Germany. Settlement of their demands is still pending, as are several minor Czechoslovakian, Dutch, and Belgian territorial claims. Their final acceptance or rejection will define the future territorial limits of Germany.

According to present indications, the future Germany will encompass roughly 138,000 square miles with a prewar population of 60 million. The latter figure, however, is not conclusive. Most of the population of the regions annexed by Russia and Poland will be shifted back to what is left of Germany. They are estimated to number about 8 million. Two million Germans are to be expelled from Czechoslovakia. Probably at least 500,000 more, previously settled in European countries overrun by the Germans, have fled back to Germany. German fatalities in the war, never officially disclosed, may run as high as 5 million, about 15 per cent of which were suffered by the population of countries annexed since 1938. A normal increase of population should have raised the total by about 2 million. On balance, these factors would bring the estimated population figure to almost 68 million within the area of 138,000 square miles.

Established Principles for the Administration of Germany.—The administration of Germany is outlined in the communiqué issued by the "Big Three" after the end of the Potsdam Conference on August 2, 1945. According to this declaration, an agreement was reached by the United States, Britain, and Russia concerning the occupation of Germany for the purpose of extirpating German militarism and nazism and of making sure that Germany will never again threaten her neighbors or the peace of the world.

The principles of the Potsdam declaration may be outlined as follows:

The German people shall be given the opportunity to prepare for the eventual reconstruction of their life on a democratic and peaceful basis. Supreme authority in Germany is to be exercised, on instructions of their respective governments, by the commanders in chief of the armed forces of the United States, the United Kingdom, the USSR, and the French Republic, each in his own zone of occupation. They shall act jointly, in matters affecting Germany as a whole, in their capacity as members of the Control Council. So far as is practicable, there shall be uniformity of treatment of the German population throughout Germany. The Control Council shall effect the complete disarmament and demilitarization of Germany and the elimination of all German industry that could be used for military production. It shall convince the German people that they have suffered a total military defeat and that they cannot escape responsibility for what they have brought upon themselves.

The Control Council is supposed to destroy the National Socialist Party and its affiliated organizations and to insure that they are not revived in any form. It will prepare for the eventual reconstruction of German political life on a democratic basis and for Germany's eventual peaceful co-operation in international affairs. All discriminatory laws of the Hitler regime are

abolished. War criminals shall be arrested and brought to judgment. Nazi leaders, influential Nazi supporters, high officials of the Nazi Party organizations, and any other persons dangerous to the occupation or its purposes are to be arrested and interned. All members of the Nazi party who have been more than nominal participants in its activities and all other persons hostile to Allied purposes shall be removed from responsible positions and replaced by persons deemed capable of assisting in the development of genuine democratic institutions in Germany.

German education shall be controlled in order to eliminate Nazi and militaristic doctrines and develop democratic ideas. The judicial system is to be reorganized according to the principles of democracy and equal rights for all citizens. The administration of affairs in Germany is to be directed toward the decentralization of the political structure and the development of local responsibility. Local self-government is to be restored on democratic principles as rapidly as consistent with military security and the purposes of the military occupation. All democratic political parties shall be allowed and encouraged to function. Representative and elective principles shall be introduced into regional and provincial administrations, but for the time being no central German government shall be formed. However, certain essential central German administrative departments, headed by state secretaries, shall be established, particularly in the fields of finance, transport, communications, foreign trade, and industry.

The production of arms, ammunition and implements of war, as well as all types of aircraft and sea-going ships, shall be prohibited. Production of items directly necessary to a war economy shall be rigidly controlled and restricted to Germany's approved postwar peacetime needs. Productive capacity not needed for permitted production shall be removed in accordance with the reparations plan, or, if not removed, shall be destroyed. The German economy shall be decentralized and cartels, trusts, syndicates, or other monopolistic arrangements shall be eliminated. Emphasis shall be given to the development of agriculture and peaceful domestic industries.

During the period of occupation, Germany shall be treated as a single economic unit and common policies shall be established in regard to mining and industrial production and allocations; agriculture; forestry and fishing; imports and exports; banking and currency; taxation and customs duties; reparations and removal of industrial war potential; transportation and communications. Allied controls shall be imposed upon the German economy, but only to the extent necessary to carry out the program of disarmament and demilitarization; to collect reparations and govern exports and imports; to assure production and maintenance of goods and services required for the occupying forces and displaced persons; to maintain in Germany a living standard not exceeding the average of the standards of living in European countries; to insure equitable distribution of commodities between the zones of occupation; and to prevent Germany from developing a new war potential. German public and private scientific bodies and research institutions are to be closely supervised.

Administrative machinery shall be created and German authorities required to assume responsibility for its proper functioning. German controls or activities which may run counter to the objectives of the occupation are prohibited. Measures shall be taken promptly to effect the essential

repair of transport, to enlarge coal production, to increase agricultural output, and to effect emergency repairs of housing and essential utilities.

Reparations shall be taken from Germany, but their payment shall leave enough resources to enable the German people to subsist without external assistance. Reparation claims of the USSR shall be met by removals from the Soviet-occupied zone of Germany and appropriate German assets abroad. The USSR undertakes to settle the reparation claims of Poland from its own share of reparations. Reparation claims of all other countries shall be met from the western zones of occupation and from appropriate German assets abroad. In addition to the above-mentioned reparations, the Soviet Union shall receive from the western zones 15 per cent of the industrial capital equipment from the mechanical, metallurgical, and chemical industries which is unnecessary for the German peace economy in exchange for an equivalent value of food, coal, potash, zinc, timber, clay products, petroleum products, etc., plus 10 per cent of such equipment without payment or exchange in kind. The German Navy and merchant marine shall be disposed of by arrangements to be made later.

The Present Situation of Germany.—The question of German ability to maintain a standard of living above starvation level under the conditions created by military surrender and subsequent territorial and economic restrictions cannot yet be answered definitely. It will depend to a large extent upon whether the Germans are willing to accept facts and reorganize their life accordingly.

Although the Germans frequently claimed that lack of space choked their economic and physical development, prewar Germany ranked only fourth among European countries in density of population, with 135 persons per square kilometer (1 sq. km. = 0.3861 sq. miles). Countries with denser populations per square kilometer were Belgium (274), Great Britain (271), and Italy (140). After the loss of its eastern provinces, Germany will be third in density of population. The increase of population in Germany since 1910 has averaged 0.59 per cent a year. (England averaged 0.51, Belgium 0.39, Switzerland 0.40, Sweden 0.53, Italy 0.64, and France only 0.04 per cent.)

After the end of the First World War, the German birthrate declined. Research work carried out by the Friedrich List Gesellschaft in 1927 led to the conclusion that the population of Germany was "overaged," that it would continue to increase until 1945, when it would reach 106 per cent of the 1927 figure, and then decline to less than 50 million by the end of the present century. The Nazi program of encouraging births temporarily reversed the trend. Without such official encouragement and under lowered economic standards, the predictions of the Friedrich List Gesellschaft might well be fulfilled and the density of Germany's population decrease below the prewar level. In that case, the problem of how the German people are to live on their own production would gradually tend to solve itself.

Economic Effect of the Loss of German Territories in the East.—German official statistics for 1938 (latest prior to the Second World War) listed total deposits of coal and iron by districts as follows (figures given in millions of metric tons): Pit coal: Ruhr—55,100; Saar—9,205; Krefeld—7,100; Western Upper Silesia—4,000; Brüggen-Erkelenz—1,700; Aachen—1,570; Lower Silesia—1,240; Hanover—250; Saxony—230. Soft coal: Lower Rhine—17,774; Lausitz—16,374; Thu-

ringia-Saxony—9,565; Eastern Germany—8,414; Brunswick-Magdeburg—1,850; Silesia—1,299; Lower Hesse—277; Bavaria—229; Rhine-Main—91; Westerwald—48; various deposits—837. Iron ore: Siegerwald—98; Lahn-Dill—68.4; Westerwald—3; other Rhine districts—25; Thuringia—80; Harz—18; Silesia—2.

Thus, the loss of the eastern territories will reduce Germany's resources of pit coal by 7 per cent, of soft coal by 56 per cent, of iron ore by less than 1 per cent. Potash is found exclusively outside of that lost territory and so is oil.

Industrial output—not listed regionally by German official publications—can be estimated from the total payrolls of industrial establishments as disclosed by taxation reports. The total of industrial and mining wages paid in Germany in 1937 was listed at 12,127,300,000 marks. The equivalent figure for the lost eastern provinces was 830,000,000 marks—less than 7 per cent. The lost areas therefore had an industrial and mining production per capita below 50 per cent of the average for the Reich. The agricultural area of Germany covered 26,705,000 hectares (1 ha. = 2.471 acres) in 1937, of which 7,055,000 are now lost. Cultivated forests totaled 12,488,738 hectares, of which 2,257,182 are in ceded territory. The loss of farmland amounts roughly to 26 per cent, of forests to 18 per cent. The fertility of the lost agrarian regions does not differ greatly from the average in prewar Germany. The 1937 wheat harvest in East Prussia was 16.3 quintals per hectare (1 quintal = 220.4622 pounds avoirdupois); in Pomerania it was 19.3; in Silesia, 17.4. The average for the whole Reich was 22.6. Equivalent figures for rye, barley, and potatoes were as follows:

	Rye	Barley	Potatoes
East Prussia	15.8	21.2	196
Pomerania	15.6	20.6	190.4
Silesia	17.4	21.3	201.8
All Germany	16.6	21.2	191.5

The local administrations of the lost provinces had an average annual deficit of 500,000,000 marks.

The possible loss of the Rhineland, Ruhr, and Saar would have far more serious effects upon the German economy. Industrial production in the Rhineland and Westphalia was about four times that of all territories annexed by Poland and the Soviet Union.

Manpower.—Even if the Russians keep their German prisoners of war in the Soviet Union for a long time to do reparation labor, there will still be plenty of manpower in Germany for production, reconversion, and reconstruction. Before the war, 49.4 per cent of the German population was employed (65.5 per cent of all men, 34.3 per cent of all women). The loss of workers after the cession of eastern territories and population switches will therefore amount to about 1 million. In 1933, German unemployment reached its peak of 6,013,602. From 1933 until the outbreak of the war, an average of 4 million were either active in armament production or in the armed forces of the Reich or the Nazi party. Under normal conditions, that number would have been jobless, despite the fact that German industrial production increased by 48.7 per cent from 1926 to 1937, compared to a world average (excluding Russia) of 22.8 per cent. With war production and every form of military service eliminated, there will be a permanent surplus of German manpower.

Industrial Production.—Despite enormous production for the Wehrmacht, prewar German

industry not only kept the Reich's civilian population adequately supplied, but also succeeded in creating a surplus in the foreign trade balance in spite of substantial food imports. From 1929 until the outbreak of the Second World War, the trade balance only once showed an excess of imports over exports. In 1937, exports were valued at 5,911,000,000 marks; imports at 5,468,000,000. Workers previously engaged in military service, military construction, and the armament industry are now available for peacetime production, which means that industrial output will increase sharply as soon as production facilities are available.

Investigations made by the Kilgore Committee of the United States Senate estimated Germany's present industrial capacity at 25,000,000 long tons of iron and steel, 437,000,000 l.t. of coal, 2,228,000 l.t. of coal products, 450,000 l.t. of synthetic textiles, 100,000 l.t. of synthetic rubber, 5,600,000 l.t. of natural and synthetic petroleum products, and 250,000 l.t. of aluminum. Figures for dyes and chemicals are not available but probably run high.

Plants and Equipment.—There is no conclusive information at hand regarding the present condition of German industrial plants, but it can be presumed that in the Russian zone of occupation, and even in the parts of Berlin now under non-Russian rule, almost all factories have been dismantled and their equipment shipped to the Soviet Union. There are no reports at the time of writing of large-scale dismantling in the western zones, except for a few exclusively military installations. Thirty plants were reported by early December to have been evaluated for reparations in the U.S. zone of occupation. As long as the war in the Far East continued, certain German factories in these zones—such as the Zeiss works and the Volkswagen factory—were even put to work for the Allied armies.

Raw Materials.—Germany frequently complained in the past about a lack of raw materials. Its 1937 trade balance showed raw material imports valued at 3,294,600,000 marks against exports of 977,600,000 marks. Semifinished goods, especially textiles, accounted for a large part of the latter figure. The imports, however, were inflated by the needs of the war machine. The raw material situation in Germany will deteriorate as a result of the loss of the eastern provinces, but a converted German industry should be able to cover the deficit by exports of peacetime goods.

Agricultural Production.—Before the outbreak of the Second World War, Germany produced about 93 per cent of its food requirements. Due to the territorial losses in the east, this figure will drop steeply to 70 per cent. If Germany makes up the deficit exclusively through imports, it would have to increase its industrial exports to an extent that would seriously interfere with the foreign trade of other countries. But there are indications that the agricultural output can be raised substantially.

For a long time, the Reich's economic experts correctly concluded that it would be cheaper to buy food from agrarian European countries in exchange for German manufactured products than to increase food production at home. In the 50-year period before 1933, the number of Germans engaged in industry and trade rose by 85 per cent, and those employed in commerce and transportation by 172 per cent, but the number of farm hands decreased by 10 per cent. During the Nazi regime, there was a good deal of talk about greater food production, but the Nazi government needed industrial production for its war

machine too badly to encourage the migration to the soil in more than words.

Some 7,856,300 hectares of land, slightly less than what was lost in the east in farmland and forests, are uncultivated in Germany. A great portion of this area is arable; 3,369 large estates cover 9,628,591 hectares, more than 2,793,871 small holdings combined. Agrarian reforms could open a great deal of land to cultivation.

Wages of agricultural workers in prewar Germany differed widely according to the region, whereas industrial wages were about the same everywhere. Where farming had to compete with industry for manpower, farm wages averaged 1,100 marks a year, but farm laborers in purely agrarian districts were paid no more than 240 marks, both exclusive of board. (One U.S. dollar = 2.40 marks at the official rate and 4 marks at an official preference rate.) Stabilization of agricultural wages at the higher level throughout Germany would help to attract workers to farms.

The Germans have been predominantly city dwellers for many decades. Only 32.3 per cent of the population lived in communities with less than 2,000 inhabitants before 1938. Various movements inside the former Reich called for a return to the land. Active encouragement of such agrarian tendencies could help to overcome the serious shortage of food.

Housing.—Repair and reconstruction of destroyed dwellings in Germany is certain to take a long time. In 1937, 168,000 dwellings with 320,000 apartments were constructed in the Reich. At that rate, it would take about 10 years to replace the housing destroyed by bombs and shells. In 1937, however, the government was rationing manpower and nonmilitary construction was deliberately neglected. Since almost all essential materials are available, construction can now be accelerated.

Transportation.—Transportation is the most critical problem in Germany at present. The German merchant marine, totaling 4,243,835 tons before the war, is lost. Aerial traffic, carrying 323,101 passengers and covering 1,483,576 long ton-miles in 1937, will not be resumed in the near future. The German railroads, almost completely state-owned, had a total length of 41,300 miles in 1937, of which 13,280 miles are lost to Poland and the USSR. The rolling stock of the "Reichsbahn" is now reduced to a tiny fraction of its 1937 equipment of 20,711 locomotives, 1,762 self-propelled cars, 64,489 passenger cars, and 574,999 freight cars. The capacity of the German railways, which carried 298,991,280 long ton-miles of goods in 1937, is estimated today at about 15 per cent of its prewar level. The Russians confiscated almost all of the remaining rolling stock in their occupation zone and shipped it to the Soviet Union. The western Allies had the rolling stock put into operation in their zone, where it was most urgently needed, but it was extremely deficient in both quality and quantity.

German highways, the best on the European continent, do not solve the current transportation problem. Although they have not suffered much damage, scarcity of fuel and tires keeps the remaining automobiles off the road. In 1938, Germany had 1,271,983 passenger vehicles, 1,513,328 motorcycles, and 365,731 trucks. It also had almost 2,000 miles of superhighways, 25,618 miles of paved highways, and 105,392 miles of country roads. About 17½ per cent of the roads were lost to Poland and Russia.

German inland waterways now account for much of the freight traffic inside the western part

of Germany. Shipping capacity available within the American zone of occupation is estimated at 300,000 tons. Total figures for all the western zones have not been disclosed. The restoration of German transportation is one of the primary conditions for a return to economic normalcy within the Reich. It was suggested by the Economic Division of the United States control group in Germany to put all repair of rolling stock on a 24-hour basis until more than 40,000 temporarily unusable railroad cars were restored. A total of 5,590 was salvaged in September and 4,400 in October.

Finance and Reparations.—The financial status of Germany, somewhat obscure since 1933, when rearmament was financed by most intricate operations, is chaotic after defeat. Last reports before the march of aggression began in 1938 listed German public debts covered by bonds and bills at 24,384,800,000 marks and private loans secured by bonds and bills at 10,966,600,000. These figures included 2,338,000,000 marks of public debt and 770,100,000 marks of private debt owed to foreign investors. This was an increase of 80 per cent within four years, but the real debt figure should have been even higher. Chancellor Adolf Hitler on April 28, 1939, told of German armament expenditures totaling 90 billion marks between 1933 and 1939. Germany's war expenditures were conservatively estimated at about 100 billion marks a year, only 35 per cent of which were covered by taxation.

The foreign debt now consists mostly of reparations. Although the figure is not yet final, the reparations bill can be estimated at 20 billion dollars, to be paid for in kind or by confiscation of German assets. This amount would be little more than half of what Germany plundered from the countries overrun by the Wehrmacht. The London Ministry of Economic Warfare, on Oct. 10, 1944, estimated that figure at \$26,400,000,000, not including Austria or the transfer of industrial equipment from occupied countries to the Reich. The complete total is privately estimated at \$37,000,000,000.

Germany's internal debts are currently estimated at 400 billion marks. They cannot possibly be paid out of normal tax revenues and will probably be canceled out by inflation, just as they were after 1918.

The assets of the German state consist mostly of state enterprises, the most important of which are the Reichsbahn (state railroads), with investments aggregating \$12,250,000,000, the Reichspost (postal service), and state domains, many of them in the lost provinces. These assets cannot be liquidated. Private property will have to be confiscated to pay reparations. Privately owned German holdings abroad, according to the testimony of Henry Fowler, director of the enemy branch of the Foreign Economic Administration, before the Kilgore Committee are as follows:

Country	Millions of dollars
Argentina	200
Other Latin American countries	250
Liechtenstein	222
Portugal	27
Spain	200
Sweden	76
Switzerland	300
Turkey	30
United Kingdom	70
United States of America	340
Total	1,715

Machine tools still in Germany were estimated by the same witness at 4 million tons, representing a very high value.

The collection of reparations, according to a

Russian suggestion, should be completed within a period of two to three years, with Russia getting the lion's share for herself and Poland. These two countries suffered by far the heaviest damage from the German invasion.

Allied Administration of Germany in Practice.—At the Potsdam Conference it was decided that Berlin, with a prewar population of roughly 4,500,000, should be jointly administered by all four occupational powers. The rest of the Reich was divided into four zones. The smallest of these, about 6,500 square miles with a prewar population of 3,500,000, went to the French. It includes the Saar, the Palatinate, and part of Baden. The rest of Germany, excluding the districts ceded to Russia and Poland, was divided into three roughly equal parts for occupation by the United States, Britain, and Russia. The American zone, in southwestern Germany, includes Bavaria east of the Rhine, Württemberg, Hesse, and part of Baden. The British zone, in northwestern Germany, includes Hannover, Westphalia, Schleswig, the Rhine Province, Lippe, and the former free cities of Hamburg, Bremen, and Lübeck. The Russian zone, in eastern Germany, is somewhat larger and includes Brandenburg, Saxony, Mecklenburg, Thuringia, and Dessau. In peacetime, the population density was greatest in the British zone and smallest in the American, although displacements during the war have altered this situation. The American zone was crowded with refugees from other parts of Germany shortly before the surrender, many of whom have remained. After General of the Army Dwight D. Eisenhower took over his assignment in the United States as Army Chief of Staff, Gen. Joseph T. McNarney was appointed commander of U.S. forces in Europe, of U.S. forces occupying Germany, and U.S. representative on the Allied Control Council for Germany, with Lieut. Gen. Lucius C. Clay as deputy military governor. The British commander is Field Marshal Sir Bernard L. Montgomery; the Russian commander, Marshal Grigory Zhukov; the French commander, Maj. Gen. Pierre Koenig.

Traffic between the zones of occupation was not immediately resumed on any large scale, which delayed arrangements for an exchange of goods between zones. Uniformity of treatment of the German population has not been achieved, nor has noticeable progress been made toward unity of the German economy. The Allied Control Council, as established in Potsdam, meets only infrequently and its activity has been chiefly confined to the drafting of plans to be carried out in the indefinite future. The French government was occasionally blamed for opposing unifying measures. It is obvious that France wants its claims in Western Germany to be settled as those of Russia and Poland were in the eastern Reich, before cooperating, and that the French, having suffered three German invasions within 70 years, are worried by the outlook of another unification of Germany.

On September 20, the council in Berlin agreed on the principal features of a German export-import policy, integrating all occupational zones. Imports and exports are to be planned and controlled, even as to prices, by the council or its agents. Export receipts will be kept in a fund to be used to pay for imports. Payments for both imports and exports are supposed to be made in United States dollars or any other foreign currency acceptable to the Allied Control Council.

Imports are to be limited to what is considered indispensable for the German economy.

Controls over the German economy are to be imposed to insure the equitable distribution of essential commodities among the zones and reduce the need for imports. With the almost complete removal of industrial equipment from the Russian zone, the problem of supplying Germany with essential commodities, as far as it can be carried out by domestic production, will thus rest on the plants in the American, British, and French zones of occupation. On December 4, General Clay assured German representatives that food would be sent from the United States to support the diet of 1,550 calories a day, as of Jan. 1, 1946, the expense of such supplies to be met when Germany is able to pay.

Huge quantities of war equipment have been seized in all zones, but final figures are not available. The Nazi party was dissolved and outlawed and its decrees were voided. However, some former Nazis are still attempting to hold public office.

The expected removal of persons with obvious Nazi affiliations from responsible positions in the German economy was not fully carried out. American occupational authorities in some cases blocked economic de-nazification with the argument that the ousting of all compromised men would reduce the efficiency of various establishments to a degree detrimental to the supply of their zone.

Local burgomasters were named almost everywhere in Germany by occupation authorities. Trying to make great strides toward regional self-government, American authorities encouraged the formation of a provincial government of Bavaria (an area of roughly 27,000 square miles with 7,000,000 inhabitants). The results were decidedly discouraging. Prime Minister Fritz Schaeffer, appointed to his office on June 7, 1945, named Dr. Gessler as his confidential adviser. Gessler was German war minister during the period of secret rearmament (1920-28). Ernst Fischer, minister of finance, turned out to be a former deputy leader of the Bavarian Nazi party. Dr. Otto Schwinck, minister of transportation, once worked for the Nazi Labor Front, and August Fischer, minister of the interior, acted as a Nazi commissioner of German universities in 1940-41. These men were removed from office on Sept. 11, 1945, and Schaeffer, too, was compelled to resign. Previously, Police Col. Hans von Seisser had held the office of chief of the Bavarian police under American auspices for three months before it was remembered that he had worked closely with Hitler at the time of the latter's beer hall putsch in November, 1923. In an effort to find Germans fit to administer their local affairs, questionnaires are issued in the United States zone of occupation to applicants for public office. Up to September 11, 156,011 of these questionnaires were completed. Of the total, 42,744 applicants proved nonemployable, 9,029 were to be removed within 30 days, and 18,629 were referred to the military government's discretion with no adverse recommendations.

On September 12, Marshal Zhukov announced that the Russian occupation authorities, in a far-reaching interpretation of the term "local governments," had set up a sort of zone-government. Eleven government departments were established, each of them headed by a German under the immediate control of a corresponding department of Marshal Zhukov's own staff. The announcement listed the departments and their directors as follows: Agriculture—Edwin Hoernle (Communist); Education—Paul Wandel (Communist); In-

dustry—Leo Skrzyposinski (Communist); Transportation—Dr. Wilhelm Pfitzner (Social Democrat); Communications—Wilhelm Schroeder; Coal and Fuel—Dr. Ferdinand Friedensburg (Christian Democrat); Trade—Dr. Buschmann (Social Democrat); Finance—Heinrich Meier; Labor—Gustav Gundelach; Justice—Eugen Schiefer (Liberal Democrat); and Health—Paul Konitzer. The directors whose party affiliations are not given are supposed to have Communist ties. The former Seydlitz Committee is not represented in the new administration, and it looks as if the Soviet government decided to drop the Seydlitz group after they failed to stir up revolts in Germany during the war. The Russians probably expect their newly appointed department directors to become candidates for a future central government of Germany when the country's sovereignty is eventually restored.

No attempt was made in the British and French zones of occupation to set up local governments beyond municipal administrations and few reports have been received to date about British and French experiences with the local officials installed by occupational authorities. The western Allies still plan elections to name the future local governments within their zones, but Russian designations were made without a public vote. Central German administrative departments have not yet been established.

Prosecution of War Criminals.—Despite the sensational Nuremberg trials, progress of the prosecution is disappointingly slow and the number of arrests during the first months after the German surrender lagged far behind expectations. However, a number of prominent criminals (members of the German government, Nazi party leaders, and some of the most compromised generals and admirals) were seized for trial. It seems probable that most of the millions of petty looters and torturers will escape punishment. (See WAR CRIMES TRIALS.)

The Americans and British released many German prisoners of war to restore transportation, agriculture, and coal production within their zones. Reports from the Russian zone are meager, but there are indications that a large number of German prisoners were put to work in Russia and Poland. The French used German prisoners in the devastated regions of France. The Germans have shown marked reluctance to undertake their own rehabilitation. Leading industrialists as well as local public functionaries clamored for Allied support and relief, expecting such help mostly from the United States.

Politics, Education, and Press.—Political activity in Germany, based on democratic principles was encouraged by the Potsdam Declaration. It is furthest developed in the Russian zone. Four political parties (Communists, Social Democrats, Christian Democrats, and Liberal Democrats) are busy there. As Russian ideas of democracy differ from those in the United States, not all of these parties would be considered democratic by American standards. Labor unions have been revived in Berlin. Eighteen of them were united into the *Freier Deutscher Gewerkschaftsbund* (Free German Trade-Union-Federation). This organization is headed by a council of eight, four of whom are Communists. The Communists were by no means as strong proportionately in pre-Hitler German trade unionism, which was dominated by the Social Democrats. The membership of the unions is only about 200,000.

In the western zones of occupation, the Communists are less prominent. The former Catholic

Center party, the Social Democrats, and some small liberal groups have resumed their activity without eliciting much public response. Exiled German politicians have not yet been able to return to Germany and it is increasingly evident that their influence can be discounted.

German education, to be recast along nonmilitaristic and democratic lines, was resumed by the opening of many schools and a few universities.

The German press, controlled by the Allies in all zones, is still functioning on a very limited scale. Although more than 50 per cent of the total of newspaper copies printed in 1933 (10 million copies compared to 19 million) are in circulation, they are considered temporary substitutes. The German newspaper reader is still waiting for his prewar type of paper.

Events in 1945.—At the beginning of the year, the soil of the Reich was uninvaded except for tiny slices of territory in both east and west. German troops still held most of Holland, a slice of Belgium, Poland west of the Vistula River, the Baltic States, parts of Hungary and Yugoslavia, all of Austria, most of Czechoslovakia, and a sizable part of Italy.

Although the Wehrmacht was already losing the "battle of the bulge" in the west, the German public was not fully aware of the seriousness of the Reich's situation. Reports of the havoc wrought by V-1 and V-2 attacks and rumors about invincible "new weapons" gave the average German some confidence in ultimate victory, or at least in a negotiated peace which would leave the Reich intact and perhaps include some territorial gains. German propaganda, emphasizing differences between the western Allies and the Soviet Union, also promoted the illusion that Germany, in the last stages of the war, might even be able to choose between supporting the western Allies or Russia in the war against each other which Dr. Paul Joseph Goebbels predicted. The relentless bombing of German cities infuriated the Germans but did not discourage them. There was no popular opposition to the Nazi regime. The Potsdam Declaration correctly says of the German people's attitude toward their government: "Whom, in the hour of their success, they openly approved and blindly obeyed."

All of the many stories disseminated in Allied countries about the heroic resistance of a German underground proved unfounded. There was a little opposition to the Nazi regime from German conservatives with no popular following. After supporting the Hitler government to the limit as long as it was successful, these men understood that, despite all propaganda claims, the war was lost. By ridding themselves of Hitler, they hoped for a negotiated peace which would bring them to power. They were ruthlessly persecuted and wiped out by the Gestapo. The Nazi party tried to make the Allies believe that there was no choice between their rule or complete chaos in Germany.

Adolf Hitler was personally inconspicuous. The Führer was probably unable to understand the truth. For years he had tried to convince the world of his infallibility and had finally convinced himself of it. Identifying himself with the Reich, he actually expected some miracle to produce a German victory. He also relied upon new weapons. (See *WORLD WAR, SECOND, 1945.*)

Heinrich Himmler, chief of the SS and the Gestapo, became the leading spirit of the Nazi party and the German government. Himmler's policy aimed at gaining time, suppressing opposition, and trying to foment discord among the

Allies. Dr. Goebbels spread rumors through neutral channels that the western Allies were considering a separate peace with Germany and even an alliance against the USSR. Another Goebbels story told of Russia's arming 200,000 German prisoners to fight the Allies. The strategy of the German General Staff became defeatist after the "battle of the bulge" was lost. Numerous discharges and even the arrest and execution of German generals made no difference. The Wehrmacht fought a losing campaign, half-hearted in the west, frantic but hopeless in the east.

After the American seizure of the Rhine bridge at Remagen and the Russian penetration to within less than 40 miles of Berlin (See *WORLD WAR, SECOND—1945*), the German people became aware of impending defeat. The advancing Allies found the most shocking proof of German atrocities in such concentration camps as Buchenwald, Gardelegen, Dachau, Oswiecim, Belsen, and others. Millions of people were put to death by unimaginable cruelty or by slow starvation and lack of medical care. There was irrefutable evidence of the mistreatment and even murder of Allied prisoners of war. The German people's reaction to the harrowing evidence showed little shame or remorse. Conditions inside Germany were made worse by the flood of displaced persons—prisoners of war and forced laborers—who tried to get home and had to be taken care of. Although such persons frequently resorted to violence to obtain food, shelter, and transportation, (and also for revenge), the number of killed or severely injured Germans was extremely small.

In April 1945, Heinrich Himmler attempted to arrange a negotiated peace with the western Allies, leaving the Wehrmacht free to fight the Russians and allowing the Nazi Party to stay in power. Count Folke Bernadotte, president of the Swedish Red Cross, acted as Himmler's go-between. The western Allies, informing Russia of the German proposals, flatly refused to negotiate.

After the breakdown of these attempts, with the war in the west practically over and the Wehrmacht about to collapse in the east (See *WORLD WAR, SECOND—1945*), Grand Admiral Karl Doenitz broadcast from his headquarters at Flensburg, close to the Danish border, on May 1. He announced that Adolf Hitler had died heroically in the burning Reich's Chancellery in Berlin and that he had formed a new government whose first duty was "to save Germany from destruction by the advancing Bolsheviks." He added that "as far and as long as the achievement of this aim is impeded by the British and Americans, we shall be forced to carry out our defensive fight against them all."

Doubts about the authenticity of Hitler's death have been widely expressed ever since. No conclusive evidence either way had been found at the time of writing, despite a lengthy British account of the Führer's alleged end, but it seems probable that the Führer is no longer living.

The Doenitz Cabinet was composed of thoroughly compromised personalities. Doenitz himself was the strongest advocate of the ruthless type of submarine warfare carried out by the German Navy. Herr Franz von Seldt was the leader of the notorious para-military *Stahlhelm*. Count Lutz von Schwerin-Krosigk was the finance minister in Hitler's first Cabinet in 1933. The Allies did not recognize the Doenitz government. The final surrender of the German armed forces on May 7, 1945, was signed on behalf of the three branches of the Wehrmacht: Heer (army),

GERMANY

Infantry men of the United States Third Army move through the war-torn city of Prum, of which little is left but blasted buildings and debris-littered streets.

Marine (navy), and Luftwaffe (airforce) (for details, see *WORLD WAR, SECOND—1945*), and not by the German government.

To the bewilderment of Allied observers, Grand Admiral Doenitz, even after the unconditional surrender, continued to act as if he were the legally appointed head of a German government. For a time, he used a radio station at Flensburg to make unauthorized broadcasts. "I can imagine nothing which has done more harm to our cause than allowing Doenitz to have access to the radio and to broadcast to the German people the beginning of a build-up that the German Army was not defeated and that the noble German nation will rise again," stated Col. Walter E. Elliot, British Conservative M.P. German soldiers, riding on trucks through Germany, were wildly acclaimed by their compatriots and showered with flowers. The dissolution of the Doenitz government and the arrest of its members by the Allies finally put an end to new German nationalist propaganda. The fundamental attitude of the German people, however, is well illustrated by the fact that the song "*Berlin wird wieder erstehen!*" (Berlin will rise again!) became the favorite of Berliners.

British raids in their occupation zone led to the arrest of about 80,000 persons for illegal possession of arms. German sabotage rings, designed to wreck the Allied occupation, were discovered before they could do serious harm. The "Werewolf" organization, which the Nazis boasted would harass the occupation forces and kill German collaborators with the Allies, gave little evidence of its existence.

The future fate of Germany and its role in the world will depend largely upon the degree to which the Allies effectively implement the Potsdam Declaration. The menace of German aggression, terrifyingly pictured in the evidence gathered by Allied investigators in Germany and partly produced at the Nuremberg trials, will never be dissipated unless and until the demilitarization of Germany, in spirit as well as in physical fact, is complete.

Note: Statistical figures are mostly given for the year 1937 because later material applies to a Greater German Reich which no longer exists. (For information on the German Navy, see *NAVAL PROGRESS*.)

ERWIN CH. LESSNER,

Major, Austrian Army; Author, Phantom Victory; Blitzkrieg and Bluff.

GEROW, Leonard Townsend, United States Army officer: b. Petersburg, Va., July 13, 1888. Lieutenant General Gerow commanded the United States Fifteenth Army, part of Gen. Omar N. Bradley's Twelfth Army Group, for the Allied war against Germany in Western Europe. On April 28, announcement was made from Paris that the Fifteenth would occupy the American zone in Germany; and on May 19, this zone was defined. On July 21, the Fifteenth's occupation task completed, General Gerow revealed his appointment to head a board of United States officers to make a detailed study of the war.

GI BILL OF RIGHTS. Hardships and disabilities, the natural concomitants of war, fall most directly on the armed forces of the nations involved. Such, at least, is the case for the American soldiers, sailors, and airmen. Public Law 346, the Servicemens' Readjustment Act of 1944, better known as the GI Bill of Rights, is the concrete expression of Congress' plan to balance the scales for all returned veterans who may wish to avail

themselves of that measure's benefits. It is not to be confused with other acts which provide specifically for physically disabled veterans and the dependents of veterans who died or were killed in line of duty.

The GI Bill offers educational and economic help of four major kinds: (1) education and job-training; (2) guaranty of loans; (3) unemployment allowances; including aid for self-employed; (4) job-finding assistance. Collectively they represent a sharp departure from the philosophy responsible for enactment of the federal and state bonus bills passed after the First World War, when cash and time payments were deemed to be adequate acknowledgment of the public obligation to the veteran. The present effort may well be called an adjustment or payment in kind. In no sense is it a "handout." On the contrary it encourages the veteran to maintain his independency by requiring him to repay any loans he may receive under the law's provisions, receive passing grades in his educational or training courses, and meet the working standards set for any job he may secure with government aid.

Education and Job Training.—Eligibility for free job training or education, as shown in the table below, is contingent on the veteran's meeting certain requirements: (1) Discharge from the service must have been under conditions other than dishonorable. (2) A veteran who had attained the age of 25 when he entered the service or on Sept. 16, 1940, whichever is later, will be required to prove that his education suffered interference as the result of his military service. (3) Time spent by the veteran in the Army Specialized Training Program (ASTP), if it was a continuation of his civilian medical, dental or veterinary courses, and if such courses were completed, will be deducted from his time allowance. (4) The education must be begun within two years after the veteran's discharge or the official end of the war, whichever is the later. (5) The education cannot extend beyond seven years after the war.

Time in armed forces	Total school time allowed
Applies to all veterans of any age:	Under 90 days, but disabled. 12 months
	90 days or more of service. 12 months
Applies to veterans who qualify for additional training because they were 25 or under when they entered service, or if over, had their education interrupted:	6 months 18 months
	1 year 24 months
	1½ years 30 months
	2 years 36 months
	2½ years 42 months
	3 years, or over. 48 months

Up to \$500 annually will be paid by the government to institutions or their job-training equivalents for tuition, essential fees, and other necessary expenses of the trainee. In addition the veteran will receive a subsistence allowance of \$50 per month if he has no dependents; \$75, if he has one or more. These figures are proportionately reduced for veterans taking part-time courses or apprentice training, particularly where wages are being received. Training may be taken at any institution approved by an appropriate state agency or the Veterans Administration. It may be had at any level, from secondary school to college postgraduate.

Guaranty of Loans.—This provision of the law permits the veteran to arrange for a loan from a private lending agency under more favorable conditions than an ordinary civilian. Contrary to general opinion, the government makes no outright loans to veterans. To qualify for the government guaranty, the veteran must meet the following conditions: (1) other than dishonor-

able discharge; (2) at least 90 days' active service since Sept. 16, 1940 (not applicable to veterans discharged because of disability in line of duty); (3) application within two years after discharge or the end of the war, whichever is later; (4) application in all cases not later than five years after the end of hostilities. The government will guarantee 50 per cent of a veteran's loan, to a maximum of \$2,000 of a \$4,000 loan, provided the money is to be used for the purchase or improvement of a home, farm, or business. For loans of less than \$4,000, the 50 per cent guarantee limit is operative; for loans of more than \$4,000 the \$2,000 maximum sets the limit. More than one loan may be obtained, provided the total of all loans does not exceed \$2,000. Where both husband and wife are eligible as veterans, each is eligible for the full benefits. The interest rate must not exceed 4 per cent. Other provisions of the law cover guarantees of loans for a wide range of purposes, among them: repairs and improvements, purchase of supplies, liquidation of indebtedness, payment of property assessments, payment of taxes on real estate or business.

Careful scrutiny of both the borrower and the objective sought in the loan is contemplated by the law. Thus, in the event the veteran wishes to purchase a piece of farmland, the price must be adjudged reasonable and in no case more than \$12,000. Also, the experience and demonstrated capacity of the veteran must be rated satisfactory. All loans are payable within 20 years, some of them earlier.

In the purchase of war priority materials and rationed items, the War Production Board will give special consideration to the veteran who plans to establish or re-establish a business, provided that not more than eight will be employed in the business. The Office of Price Administration is similarly charged with the grant of preferences for the veteran. Lastly, certain priorities are available to him in the purchase of surplus war property of various kinds.

Unemployment Allowances.—Conditions (1) and (2) listed under the loan guaranty section likewise apply here. Compensation, not to exceed a total period of 52 weeks, may be made to veterans who are unemployed within two years after discharge or the end of the war, whichever is later. All such benefits will expire five years after the termination of hostilities. A status of complete unemployment (or if partially employed, earning less than \$23 per week), residence in the United States, registration with and continued reporting to a public employment office, ability to work and availability of suitable work are requirements for eligibility. The maximum weekly allowance is \$20, less any wages earned in part-time work above \$3. Any moneys received as compensation under a state unemployment program will be subtracted from the federal allowance. For those who qualify the following table of allowances applies:

Time in armed forces	Period of payment in weeks
90 days (or disabled prior to 90 days)	24 weeks
4 months	28 weeks
5 months	32 weeks
6 months	36 weeks
7 months	40 weeks
8 months	44 weeks
9 months	48 weeks
10 months	52 weeks

Disqualification from allowances will occur if the veteran: (1) leaves work voluntarily without good cause; (2) is suspended or discharged for misconduct in the course of employment; (3)

fails to apply for suitable work, without good cause, after referral by public employment office; (4) fails to accept suitable work when offered; (5) fails to attend available free training course, without good cause; (6) is unemployed by reason of work stoppage, the result of a labor dispute at the place of employment. Relief from the last-named disqualification may be secured if the veteran is not a participant in, or has no direct interest in, the dispute. Refusal to accept or to remain on a suitable job may result in disqualification from unemployment benefits for a four-week period. A second disqualification may last eight weeks. The sixth item listed above does not interfere with a veteran's right to participate in a strike but it does declare that he cannot strike on government pay. A final provision of the unemployment allowance clause makes it available to needy self-employed veterans.

Job-Finding Assistance.—For many veterans the first major step in readjustment to civilian status is the return to his prewar job—or a better one. Within reasonable limits that privilege was promised the veteran by the Selective Service Act of 1940. Former government employees have absolute assurance of restoration to their previous jobs or to jobs of like seniority, status, and pay. A similar general commitment has been established for private employers, although it may be voided if the employer can demonstrate that "circumstances have changed so as to make it impossible or unreasonable" to re-employ a veteran.

To qualify for government assistance the veteran must: (1) show a certificate of discharge other than dishonorable; (2) demonstrate his qualifications for the job; (3) return to his former employer within 90 days after demobilization. Discharged veterans seeking employment in new fields are assured aid in their search from a Veterans' Placement Service Board operating through the United States Employment Service. Similar aid is available to veterans who have lost their old jobs. Such official forms of government aid are variously supplemented by community and regional assistance tendered by business organizations, local officials and other official and semiofficial agencies.

Later Legislation.—H. R. 3749, passed by the House July 18 and by the Senate November 8, greatly liberalized the benefits available to veterans under the provisions of the original law pertaining to education and guaranty of loans. Under the amended bill, the government guarantee of 50 per cent of a loan, or a maximum of \$2,000, was changed in the case of real estate loans to raise the maximum to \$4,000. New provisions opened the educational program to veterans without regard to age, increased the living allowance for single veterans at educational institutions from \$50 to \$65 a month, and for those with dependents from \$75 to \$90 a month. It also authorized veterans to take short-period, high-cost courses and correspondence courses at government expense. Benefits of the GI Bill of Rights were extended to Americans who fought in the armies of other Allied governments.

HERMAN BEUKEMA,
Colonel, U.S.A.; Professor of Economics, Government and History, United States Military Academy.

GIBRALTAR. A British colony occupying a rocky promontory on the south coast of Spain. The maximum elevation of the "Rock" is 1,396 feet, and the colony, two and three-fourths miles in length and three-fourths of a mile wide, has

an area of one and seven-eighths square miles; it commands the Atlantic entrance to the Mediterranean. Prior to the Second World War the civil population, mostly descendants of Spanish and Italian settlers, numbered 20,339 between sunset and sunrise; large numbers of Spanish laborers crossed the isthmus into Gibraltar each day. In 1940, with entry of Italy into the war imminent, 15,000 Gibraltarians were evacuated, going to Northern Ireland, Tangier, Britain, Spain, or Madeira; they were repatriated in 1945. A canal was cut across the isthmus for purposes of defense, and tunnels through the Rock, two miles in length before the war, were lengthened to 10 miles. The governor (Gen. Sir Thomas Ralph Eastwood appointed Feb. 16, 1944), who also commands the garrison, is assisted by an Advisory Council first created in 1945; this body comprises the whole of the city council (6 official members and 6 elected), the colonial secretary and the attorney general. Revenue in 1943 was £505,603, and expenditure £213,316. A mass meeting on Sept. 11, 1945, expressed the desire that Gibraltar become a part of Great Britain, with its own members in the House of Commons. Roman Catholicism is the predominating religion. There are four Roman Catholic churches and one Anglican cathedral. The government gives financial support to the 13 elementary and 4 secondary schools, which had an enrolment of 2,714 pupils before the war. Industries are negligible, the people, for the most part, being engaged in servicing vessels and the considerable transshipment trade. The enclosed naval harbor has an area of 440 acres. During the war a unique airport was built at Gibraltar, the runway, 190 yards wide, extending far out into the bay; water is on both sides of the runway for nearly half of its length of 1,800 yards. A pigeon sent to Gibraltar in 1944 to replenish the lofts of the Royal Air Force established a world record flight when it flew back to its home at Gillingham, Kent, England, a distance of 1,090 miles.

GIDEONS, The. Organized at Janesville, Wis., July 1, 1899, the Gideons, the Christian Commercial Men's Association of America, International, is now the oldest interdenominational laymen's evangelistic association in the world. The purpose of the organization originally was Christian fellowship and evangelistic effort in behalf of traveling men. The founders were John H. Nicholson, of Janesville, Wis., W. J. Knights, of Wild Rose, Wis., and S. E. Hill, of Beloit, Wis. Mr. Hill was chosen first president of the organization, Mr. Knights first vice president, and Mr. Nicholson first secretary and treasurer.

In November 1908 the organization began placing the Holy Bible in every hotel guest room, a work which has made it famous throughout the world. On the date mentioned, Bibles were placed in the Superior Hotel, Iron Mountain (now Superior), Mont. Later the work was extended to include hospitals and penal institutions. The Gideons are now one of the largest purchasers of Bibles in the world. Specially bound Gideon Bibles have been placed in the rooms of practically all large hotels in the United States and in those of many foreign countries, including the leading hotels in Palestine. To 1945 nearly 2,500,000 Bibles had been placed by the organization. In 1937 the association began placing a Bible at each teacher's desk in the public schools throughout the country. In 1941, during preparations for national defense, the Gideons were permitted

through United States Army and Navy chaplains to supply the men in the armed forces with service Testaments. These Testaments contain the Psalms, and carry a foreword by the late President Franklin D. Roosevelt. To August 1, 1945, approximately 9,000,000 Testaments had been placed.

The Bible work of the Gideons is supported through freewill offerings of Christian people. The emblem of the organization is a two-handled pitcher and a torch, commemorating the Biblical account of Gideon's victory over the Midianites (Judges 7). Membership is open to any Christian man who is a church member, and is of two classes: regular, or voting membership, confined to business men; and associate membership, open to men of other occupations. Local organizations, or camps, are distributed over the United States and Canada. The association is managed by an international cabinet consisting of a president, vice president, treasurer, chaplain, and six trustees, all chosen by an annual representative convention. There is an affiliated ladies' organization, known as the Auxiliary, and consisting of the wives, daughters and sisters of Gideons.

Officers in 1945 included Ren Muller, Holland, Mich., president; Paul A. Westburg, Chicago, Ill., vice president; Samuel A. Fulton, Milwaukee, Wis., treasurer; Harry A. West, Portland, Oreg., chaplain; and N. F. Dewar, Chicago, secretary. Headquarters: 202 South State Street, Chicago 4, Ill.

N. F. DEWAR,
Secretary, The Gideons.

GILBERT ISLANDS. See WESTERN PACIFIC ISLANDS, BRITISH.

GILDERSLEEVE, Virginia Crocheron, American educator: b. New York, N.Y., Oct. 3, 1877. The daughter of an eminent lawyer, native of Dutchess County, who became a justice of New York's Supreme Court, Miss Gildersleeve attended New York City schools and Barnard College from which she received the bachelor's degree in 1899. In due course she obtained the master's degree and that of doctor of philosophy from Columbia University. Some years later Columbia also bestowed the degree of doctor of literature (1929). Joining the Barnard faculty in 1900 as an instructor in the English department, Miss Gildersleeve was advanced to assistant professor in 1910, becoming full professor and dean of the college in 1911. An excellent public speaker, tall and of commanding presence, Dean Gildersleeve soon achieved a distinguished reputation in academic circles for her wisdom and fearlessness. She never failed to express vigorous dissent when she disagreed with popular opinions. For instance, she frequently criticized coeducational institutions, declaring that they tended to establish a "male superiority" complex. A trustee of several girls' schools in the United States, and of the American College for Girls at Istanbul, Turkey, her advice in educational problems was sought by many institutions. She is the recipient of numerous honorary degrees from American colleges and universities, and of decorations from foreign governments, including France and the Dominican Republic. She was twice elected president of the International Federation of University Women (1924-26 and 1936-38). Though the dean's favorite hobby is archaeology and she is deeply versed in the Latin and early English literatures, she is far from being an ivory tower scholar. She has always taken an active interest in both national and international affairs. At the

outbreak of the Second World War she urged American aid to the Allies and vigorously opposed the isolationist group. Until the United States entered the war she forthrightly expressed her fear that American youth had grown "soft." In the spring of 1945 she was appointed one of the American delegates to the United Nations Conference at San Francisco.

GILES, Barney McKinney, United States Army Air Force officer: b. Mineola, Texas, Sept. 13, 1892. In April 1945, Lieutenant General Giles was named commanding general of all army air forces in the Pacific Ocean areas, replacing the late Lieut. Gen. Millard F. Harmon. He had previously served as chief of air staff and General Arnold's principal aide in directing global operations of the AAF. On Oct. 14, 1945, he was appointed commander of United States Strategic Air Forces in the Pacific, succeeding Gen. Carl Spaatz. He is the twin brother of Maj. Gen. Benjamin F. Giles (q.v.).

GILES, Benjamin F., United States Army officer: b. Mineola, Texas, Sept. 13, 1892. Major General Giles was named commanding general of United States Army forces in the Middle East in February 1944. The 53-year-old Texan is a veteran of the First World War, in which he served with an American air squadron in France. In August 1942, General Giles was named commander of the North Atlantic Wing, AAF Air Transport Command. In October 1943 he was shifted to the Ninth Air Force Troop Carrier Command, and in February of the next year, received his Middle East assignment. General Giles is the twin brother of Lieut. Gen. Barney McKinney Giles (q.v.).

GILMORE, Charles Whitney, American paleontologist: b. Pavilion, N.Y., Mar. 11, 1874; d. Washington, D.C., Sept. 27, 1945. Curator of the department of vertebrate paleontology at the United States National Museum after 1923, Dr. Gilmore was an international authority on reptiles and fossils. In 1923 he headed a party which discovered in Utah the bones of a *Diplodocus*, a dinosaur that was one of the earth's largest creatures and lived more than 170,000,000 years ago. In 1926 he directed a collecting trip in the Grand Canyon which found a ton and a half of slabs of sandstone and shale containing animal footprints believed to have been many millions of years old. Between 1932 and 1937 Dr. Gilmore discovered the skull of a 60,000,000 year old bird of the hawk family; the almost complete skeleton of a *Coryphodon*, an early mammal; and the bones of a *Sauropod*, a species of dinosaur which lived from 80,000,000 to 150,000,000 years ago.

GIRL SCOUTS. A nonsectarian, nonpolitical organization for girls, founded by Juliette Low in Savannah, Ga., in 1912 under the name of Girl Guides. It became a national organization in 1913, the name being changed to Girl Scouts. It is affiliated with the World Association of Girl Guides and Girl Scouts. The types of membership include the Brownie Scouts (ages 7 to 10); Girl Scouts (10 to senior high school age); and Senior Scouts (senior high school age). As of June 30, 1945, the total membership was 1,144,260. Membership fees supply the basic income, although contributions and the sale of equipment provide an additional source of revenue. During 1944-45, emphasis was placed on world friend-

ship and Girl Scout donations to the Juliette Low World Friendship Fund provided support for an orphanage in China and aid to British, Russian, Greek, French, and Italian children. Scouts throughout the country rendered aid to the Treasury Department during the Sixth and Seventh War Loan drives by conducting a nationwide clipping service for that agency. The recruiting drive for army nurses was aided by Girl Scouts, as were hospitals, whose need for volunteers was emphasized during Girl Scout Service to Hospitals Week in October 1944. By April 1945, Girl Scouts had contributed over 23,000,000 hours of volunteer service to the nation since Pearl Harbor. The organization publishes *The American Girl*, a magazine for all girls; *The Girl Scout Leader*, a magazine for adult leaders; and *It's Their World*, an annual pictorial review.

Officers of the Girl Scouts are: president, Mrs. Alan H. Means; national director, Mrs. Paul Rittenhouse; chairman of the executive committee, Mrs. Ralph G. Wright. National headquarters: 155 East 44th Street, New York 17.

GLASGOW, Ellen Anderson Gholson, American novelist: b. Richmond, Va., April 22, 1874; d. there, Nov. 21, 1945. Winner of the Pulitzer Prize in 1941 for her novel, *In This Our Life*, Miss Glasgow was among the leaders of the literary renaissance in the South and one of America's most distinguished women writers.

Born of an aristocratic Southern family, Miss Glasgow had only a little training in private schools, and for the most part educated herself by reading in her father's extensive library. She wrote her first novel, *Sharp Realities*, at the age of 18, but later destroyed the manuscript. Her first published book, *The Descendant*, was printed in 1897 without her name on the title page. Her next novel, *Phases of an Inferior Planet*, appeared, also anonymously, in 1898, followed in 1900 by the first novel to be published under her name, *The Voice of the People*. A realist and feminist, Miss Glasgow was chiefly concerned with recording the social history and political background of her native state from 1850 to the present. Her novels represented a revolt against the romantic and sentimental genteel tradition of Southern fiction. In 1925 she published *Barren Ground*, which was hailed by the majority of critics as her finest achievement. It won immediate popular acclaim, although it caused a storm of literary protest from the more conservative elements of the South. In 1940 Miss Glasgow received the Howells Medal for fiction from the American Academy of Arts and Letters, and the annual *Saturday Review of Literature* plaque for distinguished service to American literature. The next year she was awarded the Southern Authors Prize. Other works by Miss Glasgow include: poetry, *The Freeman and Other Poems* (1902); fiction, *The Battle-ground* (1902); *The Deliverance* (1904); *The Wheel of Life* (1906); *Ancient Law* (1908); *The Romance of a Plain Man* (1909); *The Miller of Old Church* (1911); *Virginia* (1913); *Life and Gabriella* (1916); *The Builders* (1919); *One Man in His Time* (1922); *The Shadowy Third and Other Stories* (1923); *The Romantic Comedians* (1926); *They Stooped to Folly* (1929); *The Sheltered Life* (1932); *Vein of Iron* (1935); *Collected Works* (1933; 1938); nonfiction, *A Certain Measure: An Interpretation of Prose Fiction* (1943).

GODDARD, Robert Hutchings, American physicist: b. Worcester, Mass., Oct. 5, 1882; d. Baltimore, Md., Aug. 10, 1945. He was professor of physics at Clark University, 1919-43. Chief of navy research on jet-propelled planes, Dr. Goddard was an internationally known pioneer in rocket propulsion. Since 1934 he had been on leave of absence at his laboratory in Roswell, N.M., working under Daniel and Florence Guggenheim Foundation grants, and since 1943 he had been employed by the government as a consulting engineer, doing special experimental work at Roswell. Dr. Goddard was one of the first to install accurate gyroscopic steering mechanisms on rockets and to devise parachutes for their descent. One of the most important advances in rocket science which he achieved was the means of insuring a continuous flow of power instead of merely an initial explosion.

GOEBBELS, Paul Joseph, Nazi propagandist: b. Rheydt, Germany, Oct. 29, 1897; reported to have committed suicide in Berlin, May 2, 1945. Diminutive, club-footed, Dr. Goebbels put into effect with incredible success Adolf Hitler's principle of falsification as a legitimate means of achieving power, first in his unofficial capacity as party spokesman, later as the Third Reich's minister of propaganda and public enlightenment (1933-45), and contributed as much toward infecting the German nation with nazism as did Hitler himself.

Dr. Goebbels was exempted from military service in the First World War because of his deformity, and in 1921, took his doctorate of philosophy at the University of Heidelberg. During French occupation of the Ruhr, he did organizational work for the Nazis and was expelled from the Rhineland by the French in 1924, the year he joined the Nazi Party. Moving to Elberfeld (Wuppertal), he edited a small newspaper; soon gained party recognition as a platform speaker, a role for which he had a natural ability; and toured towns of the northern Rhineland, ranting against the Allies, the Weimar Republic, and the Versailles Treaty.

By 1926, when he first met Hitler, he had disassociated himself from the Nazi left wing element with which he had originally been identified, and put his talents at the service of the Hitler faction. In October of that year, he was rewarded with the post of *gauleiter* for Berlin, later for the entire Brandenburg Province. In 1927, he founded his weekly, *Der Angriff* (*The Attack*), which in 1930 became a daily. Here his venomous pen had full play. It is said that at one time he had 126 libel suits pending against him. His literary efforts, however, like his oratory, continued to pay dividends. In 1928, he was elected to the Reichstag; in 1929, appointed Reich propaganda leader; and in 1930, re-elected to the Reichstag.

Goebbels is said to have planned, with Marshal Göring and other high Nazi officials, the Reichstag fire, staged on the eve of a national election in February 1933 to legalize Hitler's usurpation of power, and he is also credited with conceiving the idea of the burning of the books, whereby thousands of volumes of the world's finest literature were destroyed because they were regarded as "inimical to Germany's national interests."

He was author of the national press law, passed in October 1933, which provided Nazi-made rules for admission to the newspaper profession, and reduced German journalism to a

government function. In November 1933, he reached new heights with his creation of the National Kultur Chamber—a body governing music, the graphic arts, literature, sculpture and painting, motion pictures, radio, and the theater. As its president, he assumed control of the entire cultural life of Germany.

GOLD. The final estimate of refinery production of gold in the United States (Alaska included) during 1944 was 1,022,238 fine ounces, as compared with 1,394,522 ounces mined in 1943, according to the report compiled by the United States Bureau of the Mint, with the co-operation of the Bureau of Mines. The value of the gold produced, calculated at \$35 per fine ounce, was \$35,778,330 in 1944 compared with the 1943 value of \$48,808,270. Of the 1944 output, Utah contributed 353,550 fine ounces; Arizona, 127,619 ounces; Nevada, 115,561 ounces; and California, 115,555 ounces. Alaska's output in 1944 was 50,848 fine ounces, and South Dakota's production dropped to 10,875 ounces.

GORING, Hermann Wilhelm, German Reichsmarshal: b. Rosenheim, Bavaria, Jan. 12, 1893. Former commander in chief of the German Air Force and one-time successor designate to Adolf Hitler, Hermann Göring surrendered to the American Seventh Army on May 9, 1945; was later indicted as a major Nazi war criminal and held for trial before the International War Crimes Tribunal. An early member of the Nazi Party, he held a number of key positions in the Nazi hierarchy between 1932 and 1945, among them that of Reichstag president (1932ff); trustee of the four-year plan under which civilians of overrun countries were enslaved; and president of the council for war economy (from 1940). In this latter capacity, he diverted 50 per cent of Germany's national income to war production. Göring served in the German Air Force in the First World War, and in June 1918 became commander of the "Flying Circus" squadron made famous by von Richthofen. He was involved in the National Socialist uprising in Munich in 1923, and from 1923 to 1927, took refuge in Italy.

GOULD, Kingdon, American financier: b. 1887?; d. New York City, Nov. 7, 1945. Eldest son of the late George J. Gould, and grandson of Jay Gould, who founded the Gould fortune, Mr. Gould was graduated from the School of Mines of Columbia University in 1908, and soon after took his place on the boards of several of the so-called Gould railroads, including the Denver and Rio Grande; Missouri Pacific; Western Pacific; Texas and Pacific; as well as the Western Union Telegraph Company, in which his grandfather had been an important factor.

GOVERNMENT PRINTING OFFICE, United States. The office was established by Congress in 1860 and has been in continuous operation from that time. In addition to doing all of the printing and binding ordered for Congress, the office executes all the printing and binding required by the various executive and judicial departments, all independent establishments, and emergency war agencies of the United States government.

The total area occupied by the Government Printing Office proper in 1944 was 1,396,973 square feet or 32.1 acres. In addition, the office

occupied seven warehouses in various sections of the United States covering 125,237 square feet of floor space or 2.9 acres. During the fiscal year 1945 it was necessary to place orders with outside contractors for printing in the amount of \$28,116,779.65, as the Government Printing Office was unable to handle the volume of printing necessary in connection with the war. The value of the office buildings in 1945 was \$9,634,825, machinery and equipment \$6,439,623, making the total value of the plant \$16,074,448. At the close of the fiscal year 1945, there were 6,914 employees on the rolls with a payroll of approximately \$20,000,000. The office made charges for 1,045,739,990 copies of publications of all classes. This total included 6,966,725 copies of the *Congressional Record*, 5,976,886 copies of the *Federal Register*, 3,632,330 copies of specifications of patents, trademarks, designs, etc., and 309,212 copies of the Patent Office *Official Gazette* and annual indexes. The number of postal cards printed amounted to 2,386,933,000 and money orders 300,696,304. The stores division and warehouses handled 6,314 carloads of paper weighing 292,110,941 pounds. The Division of Public Documents mailed out 166,748,939 publications and forms; its receipts from the sale of government publications during the year amounted to \$2,180,476.66. The total charges made to Congress and all other government agencies during the fiscal year were \$77,528,513.47.

GRAHAM LAND. See FALKLAND ISLANDS.

GRANT, Heber J., American religious leader: b. Salt Lake City, Utah, Nov. 22, 1856; d. there, May 14, 1945. The Mormon Church enjoyed prosperity and expansion during Heber J. Grant's administration as seventh president, prophet, seer, and revelator of the Church of Jesus Christ of Latter-Day Saints. The son of a former mayor of Salt Lake City, Grant attended Deseret University, now the University of Utah. He became a member of the Latter-Day Saints before he had reached the age of 20 and in 1882 was elected a member of the Council of Twelve and an Apostle. He was entrusted with the founding of a Mormon mission in Japan in 1901, and three years later went to Europe, where he superintended the work of Mormon missions until 1906. He served a term as a member of the upper house of the Utah territorial legislature and for several years was a member of the Salt Lake City Council. In 1916 he became president of the Council of Twelve and two years later head of his church.

GRAPEFRUIT. See CITRUS FRUITS.

GRAPES. Production of this fruit in the United States in 1945 totaled 2,841,150 tons, as compared with the 1944 crop of 2,736,550 tons and a 1934-43 average crop of 2,474,835 tons. California, long the leading producing state, produced 2,714,000 tons in 1945; 2,514,000 tons in 1944, and 2,256,700 tons as an average crop in 1934-43. No other state approached this record. New York, the next highest, produced 33,200 tons in 1945; 59,300 tons in 1944; and an average of 58,890 tons in the ten-year period 1934-43. Michigan was third with 11,400 tons in 1945; 34,000 tons in 1944; and an average of 41,600 tons in the ten-year period 1934-43.

GRAPHITE. Production and sales of domestic natural graphite decreased in 1944, according to the United States Bureau of Mines. The combined total of crystalline and amorphous graphite produced from domestic mines was 5,408 short tons, and shipments reached 5,768 tons valued at \$349,663, compared with a production of 9,939 short tons and sales of 9,597 tons valued at \$903,102 in 1943. Stocks of crucible grade graphite increased through 1944 and by the end of the year were sufficient for 15 months' supply at the current rate of consumption. On Nov. 11, 1944, the War Production Board order controlling the allocation of graphite was amended to remove crucible grade graphite from the strategic class, leaving only Ceylon amorphous graphite, containing 95 per cent graphite carbon in lump or ground form, on the restricted list. In view of the favorable stock position of Madagascar flake at the end of 1944, a government contract for 1945 was not signed and Madagascar flake was released from public purchase at the end of the first quarter of 1945.

GRAZING SERVICE, United States. The Grazing Service administers 60 grazing districts in 10 Western states under the Taylor Grazing Act of 1934, as amended. No new districts were added during the past year although there were numerous internal changes involving both public and private lands. The total area of these districts is about 265,000,000 acres, more than half of which is federally owned. The remainder is in private, state, and county ownership.

The primary objectives of the Taylor Grazing Act are to protect and improve the forage and other natural resources of the public lands, promote orderly use of the range, and stabilize the livestock industry dependent upon it. The mixed land ownership in grazing districts fosters a wide variety of co-operative activities among states, individuals, and the federal government. Regardless of ownership the lands in grazing districts are inseparably related, both physically and economically, and the administration of the public lands aims to accomplish conservation and economic use of all the lands involved.

Preferences for grazing use of the public lands are given to land owners engaged in the livestock business, and owners of water or water rights whose past use of the public lands has been an integral part of their year-long livestock operations. Nearly 22,000 owners of land and water within or near grazing districts have been found to possess preference claims for grazing privileges on the federal range. The full extent of such preferences must be determined in each case. This involves an examination of lands and waters owned or controlled by the various applicants and a determination of the extent to which they are entitled to share in the use of the range. Also it requires an inventory of the range to determine grazing capacities and other related factors.

Range surveys to determine grazing capacities and proper stocking of the public lands are an essential part of conservation and management of the range. This part of the Grazing Service program has been retarded considerably during the war. As a result only about two-thirds of the bona fide applicants for grazing privileges were operating on a term-permit basis at the end of the fiscal year 1945. The remainder must essentially be carried on a year-to-year license basis until the necessary data are procured.

On the whole, favorable moisture conditions,

coupled with regulated use, have enabled the grazing district lands to maintain a high level of livestock production during war years. This is in sharp contrast to the situation during and following the First World War when increased numbers of livestock on the then unregulated public lands stripped the forage and hastened its depletion without adding to food supplies of the period.

Use of the federal range under licenses and permits was fairly constant during war years. In 1942, for example, 3,745,079 animal units were licensed to graze on these ranges. In 1945, 3,760,379 animal units were licensed. (An animal unit is 1 cow, 1 horse, 5 sheep, or 5 goats.) Certain economic factors during recent years have influenced a downward trend in sheep numbers and an upward trend in cattle numbers, both nationally and in the grazing districts. The number of cattle licensed on the federal range during 1945 exceeded 2,000,000 head for the first time in grazing-district history. Wildlife numbers in grazing districts have shown a steady increase during recent years. Big game counts involving 11 major species show an estimated increase of 48,000 head over total numbers reported the previous year.

In addition to their use for grazing during the war vast acreages of grazing-district land were set aside for military purposes, mainly as training and testing areas for air and land troops. Approximately 14½ million acres of such lands were so used during the past year. In this connection it was possible, however, to provide alternate-season use of certain military withdrawals for large numbers of livestock. On the other hand, certain training grounds had to be closed exclusively to livestock. An example is the area used for the atomic bomb experiment in New Mexico.

Through co-operation with local ranchers, with states, and other federal agencies, there has been consistent improvement in the range-fire situation during recent years. In 1942, nearly 1½ million acres were burned over. In 1944, the burned area was reduced to less than 300,000 acres. Watershed protection coupled with range improvements are important activities of the Grazing Service.

Range improvements consist of water developments, fencing, stock trails, revegetation, soil and moisture conservation, rodent control, and other activities designed to improve the forage and facilitate its use.

In undertaking to rehabilitate the range and stabilize its use, the Grazing Service, generally, has had the active support and co-operation of the users themselves, including the district advisory boards. In the 11 years since the passage of the Taylor Grazing Act, slow but steady progress has been made. A vast opportunity lies ahead in grazing districts for increasing the forage growth with resulting benefits accruing to the livestock industry itself and hence to the public generally. See also FOREST SERVICE, UNITED STATES.

C. L. FORSLING,

Director, United States Grazing Service.

GREAT BRITAIN, or UNITED KINGDOM OF GREAT BRITAIN AND NORTHERN IRELAND. A constitutional monarchy comprising England, Wales, Scotland, Northern Ireland, the Isle of Man, and the Channel Islands; area, 94,504 square miles; estimated population (Dec. 31, 1942), 48,332,700. Together with the Dominions and dependent territories overseas, it constitutes the British Commonwealth and Empire. With

the exception of certain fundamental laws, commencing with Magna Carta (1215), the constitution is, for the most part, unwritten and customary. The present monarch is King George VI (b. Dec. 14, 1895), who succeeded to the throne Dec. 11, 1936, following the abdication of his elder brother, Edward VIII (now His Royal Highness the duke of Windsor).

Area and Population.—The estimated figures for 1942 gave the area and population of the several divisions of Great Britain as follows:

Divisions	Area, square miles	Population 1942
England	50,337 ¹	41,896,063
Wales	8,006	
Scotland	30,410	5,043,070
Northern Ireland	5,449	1,342,267
Isle of Man	227	50,829
Channel Islands	75	92,000
	94,504	48,424,229

¹ Pop. 48,332,700 with war casualties deducted.

Around the main British island are about 500 smaller islands, the populationse of which, with the exception of the Isle of Man and the Channel Islands, have been included in those of England, Scotland or Wales, according to the coasts to which they lie nearest.

Because of conditions obtaining during the Second World War, no decennial census was taken in 1941. The capital of England is London. In 1931, the population of the Administrative County of London was 4,397,003, and of Greater London, 8,203,942. Edinburgh (pop. 439,010) is the capital of Scotland; Belfast (pop. 438,086), of Northern Ireland; Douglas (pop. 19,328), of the Isle of Man; and St. Helier (pop. 28,000) and St. Peter Port (pop. 18,250) are respectively the capitals of Jersey and Guernsey, in the Channel Islands.

Religion.—Civil disability because of religion is not attached to any class of British subjects. The inhabitants of Great Britain are almost entirely Christian, there being some 300,000 Jews and a lesser number of non-Christian immigrants. The Established Church of England is Protestant Episcopal in its form of government. According to the latest statistics, the Anglican faith has 2,294,000 full members in England, Wales, the Isle of Man, and Channel Islands. The king, as supreme governor of the Church of England, nominates to vacant archbishoprics, bishoprics, and other offices specified as within the gift of the crown. In England, there are two archbishops, Canterbury and York, 41 bishops, and 40 suffragan bishops. The church in Wales and Monmouthshire was disestablished as from March 31, 1920, Wales being constituted a separate archbishopric. The Established Church of Scotland is Presbyterian in its form of government; at the General Assembly the sovereign is represented by a lord high commissioner, appointed by the king. Members of the Church of Scotland, according to most recent statistics, number 1,278,297, besides adherents. In Scotland there are also 614,021 Roman Catholics and 61,547 Episcopalians. Northern Ireland has 428,290 Roman Catholics, 390,931 Presbyterians and 345,474 Episcopalians. Roman Catholics in England and Wales number 2,361,504; this church has four archbishops, 14 bishops, and some 4,000 priests.

Education.—Publication of statistical information on education became one of the war casualties in Great Britain, shortages of labor and paper necessitating drastic curtailment of much government printing on this and other subjects. In 1939 there were 21,678 elementary schools in England and Wales, including public elementary,

special, nursery and certified efficient, with an enrollment of 4,971,327 pupils. There were also 609 special schools for the blind, deaf, mentally defective, physically defective and epileptic; 19 Poor Law schools; 115 nursery schools; and 357 play centers. Scotland had 2,143 primary schools in 1942-43 with 381,926 pupils; and Northern Ireland, 1,667 primary schools with 185,542 pupils.

There were 2,156 secondary efficient or approved schools in England and Wales in 1938, of which 1,398 received state aid. Pupils enrolled in efficient schools numbered 569,089. There were also 81 technical colleges providing advanced courses, 208 institutions at which technical day classes were held, and 6,124 evening schools giving part-time technical instruction. Teacher-training courses were offered in 106 schools and 84 art classes. Defective students receiving instruction in higher education courses numbered 1,709, of which 1,059 were blind. In Scotland there were 986 schools with secondary divisions in 1943, these had 357,964 students. Northern Ireland had 17,535 students enrolled at 75 schools with secondary divisions.

The public system of education in England and Wales was reconstructed drastically by the Education Act (1944). For the first time, all children are to be given a free, full-time secondary education. The period of compulsory school attendance has hitherto been from 5 to 14; the leaving age is to be raised to 15 not later than April 1, 1947, and subsequently to 16 when sufficient buildings and teachers are available. Primary education now covers all educational provision for children of 11 and under; for children of 11 and over there are three main alternative types of education open—by the grammar school (education mainly of an academic nature), by the modern school (education embracing both literary and practical subjects), and by the technical school (catering for the student with a more practical bent). Not later than April 1, 1950, county colleges are to be established for young people who have left school before reaching the age of 18; part time attendance during working hours will be compulsory. The Family Allowance Act, which became law on June 15, 1945, provides that parents will be paid an allowance of 5 shillings a week for each child after the first (and if the parent is sick or unemployed, an allowance of the same amount is paid for the first child); the school-meals plan, which dates from 1906, was also extended, all children in public primary and secondary schools being given free meals without application by parents and regardless of means. In order to raise the school-leaving age to 15, and additional 13,000 teachers are required; an emergency training scheme instituted in 1945 is expected to provide this number within three years. The Education (Scotland) Act of 1945 contained fewer innovations than the 1944 measure for England and Wales, because many of the major reforms in the latter were carried out in Scotland many years ago; *Educational Reconstruction in Northern Ireland*, a White Paper published on Dec. 11, 1944, outlined proposals akin to those in the English act of 1944 though in some particulars they were not quite so far-reaching.

In England the highest education is given at 11 universities, including Oxford University, with 22 colleges and 3 private halls, and Cambridge University, with 17 colleges and 1 hall. In Scotland there are 4 universities; and Wales and

Northern Ireland have 1 university each. While 1 in 900 of the population attends British universities generally (half of them aided by grants or bursaries), 1 in 450 of the Scottish population attends the universities of Scotland. The accompanying table gives the number of professors, and the number of students in the universities (1944-45), foundation dates being given in parentheses:

Universities	Professors	Students
England:		
Oxford (1163)	230	2,638
Cambridge (c.1209)	373	3,364
Durham (1831)	339	2,289
London (1836)	1,267	10,458
Manchester (1880)	329	2,576
Birmingham (1900)	334	1,651
Liverpool (1903)	358	1,722
Leeds (1904)	415	1,737
Sheffield (1908)	210	2,085
Bristol (1909)	311	965
Reading (1926)	150	1,534
	<u>4,316</u>	<u>31,019</u>
Wales:		
University of Wales (1903)	350	2,126
Scotland:		
St. Andrews (1411)	169	1,080
Glasgow (1450)	291	3,585
Aberdeen (1494)	190	1,015
Edinburgh (1582)	342	2,859
	<u>992</u>	<u>8,539</u>
Northern Ireland:		
Queen's University (1909)	130	1,789
Grand total	<u>5,788</u>	<u>43,473</u>

1 1943-44.

There are also university colleges in England at Exeter, Nottingham, Southampton, Leicester and Hull, and special agricultural colleges at Carlisle, Cirencester, Newport, Kingston-on-Soar, Wye, Uckfield and Ripley. In Wales is an independent college at Lampeter, university colleges at Aberystwyth, Bangor, Cardiff and Swansea, and the Welsh National School of Medicine. There is a special agricultural college in Scotland at Glasgow.

All universities accept students from abroad who have passed examinations considered equivalent in standard to their own. The College Entrance Examination Board of the United States, New York City, is the official agent for conducting the entrance examinations of the University of London. Appointments to Rhodes scholarships at Oxford University, which were interrupted by the outbreak of war, are to be resumed in 1946; in addition to the regular scholarships, a limited number of war service scholarships have been created for men who have seen at least one year of war service and have completed one year (instead of the customary two years) of university work.

Government.—The present form of Parliament, as divided into two houses of legislature, dates from the middle of the 14th century. The House of Lords, consisting of peers who hold their seats by hereditary right, by creation of the sovereign, by virtue of office, or by election, has a possible membership of about 740; the average attendance, however, is less than 100. The House of Commons consists of representatives from county, borough, and university constituencies. The county and borough members are elected by popular male and female vote; university representatives are chosen by the respective universities, except that two or more representatives must be chosen by popular vote. The House of Commons elected in 1935 had 615 seats, that of 1945, 640 seats; periodical redistribution of seats on the basis of changes in the distribution of the population was enacted in 1944, but this could not be put into effect before the general

election of 1945 and therefore, as an interim measure, 20 large constituencies were subdivided into 45 seats. Five years is the maximum life of a Parliament though, except in wartime, it is rare for a Parliament to last the full period. Members of the House of Commons receive £600 per year (but members of the House of Lords are not paid), and Cabinet ministers receive higher salaries on a graduated scale; a salary is also paid on a Cabinet scale to the "leader of His Majesty's Loyal Opposition" (the principal parliamentary opponent of the prime minister). The voters do not elect a prime minister directly; after a general election the king invites the leader of the party which has obtained a majority of seats in the House of Commons to become prime minister and form a government.

The life of the Parliament of 1935 had been extended annually during the war after Nov. 25, 1940, when its statutory five years had expired, but its duration ended shortly after May 1945, when leaders of the Labour Party declined Prime Minister Winston Churchill's invitation to remain in his Coalition Cabinet another 18 months, or until the end of the war against Japan. Rejecting Labour's counterproposal to maintain the existing government until October, on May 23 Winston Churchill took the first step toward immediate dissolution of Parliament by resigning the premiership of the coalition government; the king, as is the constitutional practice, forthwith reappointed him prime minister, and he formed a new Cabinet composed exclusively of his Conservative supporters to serve until after the election. On June 15 the king formally dissolved Parliament, the longest since 1679, and summoned a new Parliament, to be chosen in July; the general election took place on July 5, though in some places voting took place one week or two weeks later, because some towns followed an old custom of shutting down for a week or two in the summer for community vacations.

The 640 seats in the House of Commons were contested by 1,680 candidates—603 representing the Labour Party, 541 the Conservatives, 307 the Liberals, the rest minor parties and independents. Viscountess Astor (Nancy Witcher Langhorne, of Virginia), first woman to sit in the House of Commons, chose not to stand for re-election after her 25 years of continuous service; Winston Churchill stood for the newly created Woodford division of Essex, his former constituency of Epping having been divided in the redistribution of seats. Foreign policy was not an issue in the campaign, the principal points in the program of all parties being adequate housing (particularly for those whose homes had suffered during the war), social security, full employment, improved health measures, and extension of educational facilities. While the Conservative Party promised early removal of wartime restrictions on private initiative and the exercise of free enterprise, the Labour Party stood for increased measures of state ownership and operation of key utilities and industries; the Liberals took a middle position, supporting the small trader, condemning cartels and price-fixing rings, and favoring nationalization where public ownership might prove more economic. The campaign was much more bitter and heated than customary at British elections (though, perhaps, it would have been regarded as comparatively mild and good-humored in some other countries), personalities arousing greater interest among the voters than programs.

Results of the general election, announced on July 26, showed a sweeping victory for the

Labour Party, which captured more than half the seats. Britain's swing to the Left proved more pronounced than even Labour had expected. Out of 24,996,905 votes cast, Labour received 11,971,464, the Conservatives 9,022,341, the Liberal Party 2,282,197, and all other parties combined 1,720,903. The number of seats secured in the House of Commons by the various parties was as follows:

Government:		Opposition:	
Labour	393*	Conservative	198
Liberal	12	Ulster Unionist	10
Independent Labour Party	3	National	2
Commonwealth	1	Liberal National	13
Communist	2		214
Ulster Nationalist	2	Independent	13
	413	Total seats	640

* Including 1 Ulster Labour.

While Winston Churchill and Anthony Eden were re-elected, 13 members of the former Conservative government were defeated, including Lionel S. Amery, Brendan Bracken (later elected at a by-election), Sir James Grigg, and Leslie Hore-Belisha. The Liberal Party lost their leader, Sir Archibald Sinclair, and also Sir William Beveridge and Sir Percy Harris; the Commonwealth Party returned only one member, and shortly thereafter its leadership was relinquished by Sir Richard Ackland, its founder and one of those defeated. While the preceding Parliament had only 14 women members at the time of its dissolution, 23 women were elected in July, 21 of them being Labour members.

Clement R. Attlee, leader of the Labour Party, accepted the king's invitation to form a government, which was shortly announced as follows:

CABINET

Prime Minister, First Lord of the Treasury, and Minister of Defence—Clement Richard Attlee
 Lord President of the Council and Leader of the House of Commons—Herbert Stanley Morrison
 Secretary of State for Foreign Affairs—Ernest Bevin
 Lord Privy Seal—Arthur Greenwood
 Chancellor of the Exchequer—Edward Hugh John Neale
 Dalton
 President of the Board of Trade—Sir Richard Stafford Cripps
 Lord Chancellor—Lord Jowitt
 First Lord of the Admiralty—Albert Victor Alexander
 Secretary of State for the Home Department—James Chuter Ede
 Secretary of State for Dominion Affairs and Leader of the House of Lords—Viscount Addison
 Secretary of State for India and Burma—Lord Pethick-Lawrence
 Secretary of State for the Colonies—George Henry Hall
 Secretary of State for War—John James Lawson
 Secretary of State for Air—Viscount Stansgate
 Secretary of State for Scotland—Joseph Westwood
 Minister of Labour and National Service—George Alfred Isaacs
 Minister of Fuel and Power—Emanuel Shinwell
 Minister of Education—Ellen Cecily Wilkinson
 Minister of Health—Aneurin Bevan
 Minister of Agriculture and Fisheries—Thomas Williams

Finance.—Total ordinary expenditure in 1944-45 had been placed at £5,937,399,000; the actual expenditure proved to be £6,062,905,000, most of the excess of £125,506,000 arising from the year's expenditure on war damage, which had been excluded from the budget estimate. Revenue exceeded the estimate by £136,263,000 in 1944-45, £3,101,800,000 having been budgeted and £3,328,063,000 actually received; the principal increases were in income tax, estate duties, national defense contribution, and excess profits tax. Thus the amount by which expenditure over the year exceeded revenue was £2,824,842,000, less than the budget estimate by £11,000,000; 53 per cent of the total expenditure was met out of current revenue, con-

stituting a record for pay-as-you-go operation of the war. The national debt stood at £22,398,100,000 on March 31, 1945, liabilities to overseas creditors exceeding £3,000,000,000 and expected to reach £4,000,000,000 before all war costs had been met.

Two budgets were presented to Parliament for the fiscal year commencing April 1, 1945, the first that of Churchill's coalition government, and the second being that of Attlee's Labour administration. In the first budget, expenditure was estimated at £5,565,281,000 and revenue at £3,265,000,000. Thus, with an excess of expenditure over revenue of £2,300,281,000, almost 59 per cent of expenditure was to be met out of revenue, current resources being devoted to the war or reconstruction rather than to meeting demands for consumable goods and services. Actual expenditure for the first six months of the fiscal year 1945-46 totaled £2,751,118,389, little less than the figure for the preceding six months (£2,944,611,584) despite the fact that the war was over; total ordinary revenue in the first six months of 1945-46 was £1,363,151,854, the deficit thus being £1,387,966,535. Hugh Dalton, Labour's chancellor of the exchequer, presented the second 1945-46 budget to the House of Commons on October 23. While agreeing with his predecessor's estimates of revenue and expenditure, he announced certain changes in the revenue schedule.

Lend Lease and Reciprocal Aid.—The president's 20th report to the United States Congress on lend-lease, issued Aug. 30, 1945, showed that Britain had received from the United States lend-lease shipments from March 1941 to July 1, 1945, of a total value of \$13,498,784,000 (£3,374,696,000); munitions accounted for \$6,784,953,000 (£1,696,238,250), the rest comprising industrial materials and products and petroleum and agricultural products. The president reported that Britain "has produced 70 per cent of all the munitions, equipment and supplies used by the armed forces of the British Commonwealth and Empire," and "has been a war production arsenal for the United Nations second only to the United States."

Down to June 30, 1945, Britain, exclusive of the Dominions, furnished to the United States reciprocal aid (reverse lend-lease) valued at £1,080,300,000, a great variety of supplies and services including strategic materials such as crude rubber for American war production, foodstuffs such as cocoa, tea, fats, and oils, and valuable technical information and inventions for our armed forces and war production."

Postwar Financing.—British economy before the war was completely dependent upon large imports of food and raw materials, these being paid for by the income from overseas investments and from exports of manufactured products. Early in the war, American investments of British subjects had been taken over by the government, which sold them in the United States and used the dollars there to purchase many goods and services outside the scope of lend-lease; one billion dollars was so spent in the United States in 1944 alone by Britain and the other sterling area countries. At the same time, Britain sacrificed two thirds of her normal exports so as to employ the manpower thus released in direct war activities, this being possible because her essential requirements were being met by lend-lease and, to a lesser extent, by mutual aid from Canada and the equivalent of loans from countries in the sterling area. As of June 30, 1945, Britain's ex-

ternal liabilities totaled £3,381,250,000 (as compared with £480,000,000 on Aug. 31, 1939), £2,743,750,000 of these liabilities being within the sterling area. The consequence of the loss of investments and the cessation of lend-lease on Aug. 21, 1945, was that the volume of post-war exports would have to be increased by nearly 75 per cent over the prewar level in order to buy the same volume of imports as before. The British government, stunned by the abruptness with which lend-lease had been terminated without consultation and prior discussion, designated the earl of Halifax, recently reappointed ambassador in Washington, and Lord Keynes, economic adviser to the Treasury, to discuss with American officials in Washington a substitute for lend-lease.

Long drawn-out negotiations terminated on Dec. 6, 1945, when an agreement was signed under which, subject to approval of the legislatures of both countries, the United States will extend to Great Britain a line of credit of \$3,750,000,000 which may be drawn upon until Dec. 31, 1951. This shall be repaid in 50 annual instalments beginning on Dec. 31, 1951, with interest of 2 per cent; interest payment may be waived in any year in which the British government finds itself in difficulty in the matter of obtaining the necessary foreign exchange. Provisions were included in the agreement regarding "sterling area" exchange arrangements, and the relaxation of British exchange controls, and a final settlement was made of the whole lend-lease account. The net sum due to the United States from Great Britain for the settlement of lend-lease and reciprocal aid, for the acquisition of surplus property and the United States interest in installations located in Great Britain, and for the settlement of claims, was agreed at \$650,000,000; this amount comprised (1) a net sum of \$118,000,000 representing the difference between the amount of the services and supplies furnished or to be furnished by either government after V-J Day through lend-lease and reciprocal aid channels, less the net sum due to Great Britain under the claims settlement; and (2) a net sum of \$532,000,000 for all other lend-lease and reciprocal aid items, and for surplus property and the United States interest in installations in Great Britain and owned by the American government.

As a result of the negotiations, Great Britain agreed to subscribe to the proposals of the International Monetary and Financial Conference of 1944 (see 1945 AMERICANA ANNUAL, *Bretton Woods Conference*), the deadline for acceptance of which was Dec. 31, 1945. While congressional authority is not required for the final settlement of lend-lease (the president having that authority), Congress will have to pass upon the matter of lending funds. This was to be considered by Congress early in 1946, and meanwhile the proposal had a generally favorable reception in the United States. American exporters anticipated that the free currency basis for trade with countries hitherto tied up with the sterling bloc would prove of considerable benefit, and importers approved, in particular, the proposed International Trade Organization, formation of which, it was agreed, is to be discussed at an international conference in the summer of 1946. British opinion was less favorable, objection being taken, notably, to acceptance by Great Britain of the Bretton Woods terms and to break-up of the "sterling area." Members of both the Labour Party and the Conservative Opposition in Parliament tabled

motions to postpone ratification of the Bretton Woods protocol and to reject the financial agreement with the United States.

War Effort.—By the time hostilities ceased, Britain's position was precarious in the extreme. During the past six years she had cut down her exports to 30 per cent of the prewar volume, had sold overseas investments totaling more than £1,000,000,000 in order to purchase war goods, and had contracted an overseas debt amounting to £4,000,000,000. Even more serious was the fact that, since she must import to live, 12,000,000 tons of Britain's 21,000,000 tons of merchant shipping had been sunk and only 5,000,000 tons of new vessels had been built, shipyards being devoted almost entirely to warship construction. As hostilities ended, 300,000 British troops were employed in the war against Japan. While forces were to have advanced from Burma into Siam and against Malaya, five divisions (British, Indian, Australian, Canadian, and New Zealand) would have served under General MacArthur in the invasion of Japan. Over 60 per cent of the Royal Navy (in itself a force three times the size of the entire navy in 1939) was serving in the Orient, one fleet supporting the campaigns of Admiral Lord Louis Mountbatten and another operating with the United States Navy in the Ryukyus and elsewhere. (For further information on the Royal Navy, see *NAVAL PROGRESS*.)

Great Britain, with a population of less than 50,000,000, had 5,500,000 men in the armed forces, about one third of the total male population. Casualties in the war totaled nearly 1,000,000. As of Aug. 14, 1945, casualties for Great Britain alone were as follows:

	Killed	Missing	Wounded	Prisoners of War	Total
Armed forces	244,723	53,039	277,090	180,405	755,257
Merchant Navy	30,189	5,264	4,402	5,556	45,411
Home Guard	1,206	557	1,763
Civilians	60,585	86,175	146,760
Totals	336,703	58,303	368,224	185,961	949,191

The total casualties of the British Commonwealth of Nations (q.v.) were 1,439,959, of this figure 949,191 being casualties among the men and women of the British Isles, at home and abroad. Casualties among the armed forces alone for the entire Commonwealth totaled 1,246,025, Britain losing 755,257 men and the remainder 490,768. Not only in total but in proportion to population, Britain sacrificed more than any other part of the Commonwealth.

One out of every 112 Londoners was a war casualty requiring hospital treatment some time during the war; with a population of about 9,000,000, 29,890 residents were killed and 50,497 injured. The bombing by stratosphere rockets, which commenced on Sept. 9, 1944, was London's third and greatest ordeal. A total of 1,050 such rockets landed in Britain, mostly in London, killing 2,754 persons and injuring 6,523; no adequate means of defense against the rockets were found, and the attacks did not cease until the launching sites were overrun by the troops advancing through the Netherlands. By Sept. 10, 1945, the War Damage Commission had been notified of damage to 3,281,953 separate properties throughout Britain, and more claims had yet to be made.

Manpower.—As of Dec. 31, 1945, the total working population of Great Britain, excluding private domestic service, was estimated to number 20,680,000; of this total, 20,005,000 were in employment (including the armed forces), 375,000 were former members of the forces who had

not yet taken up employment, and 300,000 were unemployed. The average weekly earnings rose 76 per cent during the war, from £2 13s. 3d. in October 1939 to £4 13s. 9d. in January 1945. While wage rates rose by about 39 per cent and average earnings (take-home pay) by 76 per cent, the official cost-of-living index was maintained, through subsidies, at not more than 30 per cent above the 1939 level; clothing, fuel, and light showed the greatest increases, and (because of controls) rent and food the least.

Agriculture.—During the war, farmers received a government grant of £2 per acre toward the cost of plowing, and as a result Britain was able to produce 80 per cent of her food needs, as against 33½ per cent before the war. In 1945, however, 570,000 acres less were sown in grains than in the preceding year (7,535,000 acres in 1944 and 6,965,000 acres in 1945); there were decreases in the acreages devoted to wheat (813,000) and potatoes (20,000), but increases in those of barley (199,000), oats (84,000), mixed corn (90,000), and turnips, swedes, and mangolds (4,000). The area devoted to vegetables increased during the war from 280,000 to 450,000 acres; restrictions on the growing of flowers outdoors was removed in 1945. Britain now produces all her domestic sugar supply, and the byproducts from the sugarbeet fields furnish large amounts of livestock food. The harvest of 1945, which had been one of the most promising in living memory, was damaged by heavy rains, and not more than 75 per cent of the estimated crop yield was expected to be harvested. An orchard census in 1944 showed that there were over 15,000,000 apple trees, 3,000,000 more than

when the last census had been taken in 1925; soft fruits were being cultivated on 33,750,000 acres, less than half the acreage 20 years earlier, the greatest decline being in strawberries, raspberries, and blackcurrants. In spite of the loss of acreage through the plowing-up schemes, dairy farmers broke all records for production during the war. Cattle numbered 7,328,000 in 1945 (7,505,000 in 1943) and pigs 1,687,000 (1,381,000 in 1943 and 3,515,000 in 1939); the pig and poultry industries were major agricultural casualties of the war, specialists formerly growing no feeding stuffs themselves but depending upon imported feeds.

Industry.—With the end of the war the government relaxed restrictions on the manufacture of numerous products for domestic consumption, and released for private use many factories which had been built as reserve plants in anticipation of damage by V-bombs. Statistics on steel production during the war showed that the peak year was 1943, with 13,031,000 tons (compared with the average annual rate, 1935–38, of 11,257,000 tons); production in 1944 was 12,142,000 tons, and for the first six months of 1945 it was at an annual rate of 11,970,000 tons. Exports of steel fell to 122,000 tons in 1943, against an annual average of 2,438,000 tons in 1935–38; exports of steel for the whole year 1945 were expected to exceed 1,000,000 tons.

From outbreak of war in 1939 to the end of 1944, British shipyards built 1,240 merchant vessels totaling 5,723,000 gross tons; British mer-

chant shops lost down to May 8, 1945, numbered 3,180, the tonnage being 12,500,000.

New Minerals.—Further borings for petroleum were made after location of the first field on June 19, 1939, at Eakring, near Mansfield, Nottinghamshire, wells being brought into production during the war in the same district at Kelham Hills, Duke's Doods, and Cauntton. The 240 wells in Britain were producing during the war a total of just under 70,000 tons (21,000,000 gallons) of petroleum yearly, this sufficing for only a minute part of British requirements. These drillings also disclosed new coal fields east and southeast of Lincoln; potassium deposits—the first in Britain—at Eskdale; and two natural gas wells giving, respectively, two and five million cubic feet of gas daily. These byproducts of petroleum prospecting are of considerable economic value.

External Trade.—The following table shows the value of recent import trade, compared with 1938, the general rise in average values being borne in mind:

	Imports to the United Kingdom		
	1938	1944	Jan.-June 1945
	(In £ millions)		
Total Imports:			
From British countries	371.5	514.4	263.6
From U.S.A.	118.0	532.6	218.1
From other countries	430.0	259.2	116.0
Total	919.5	1,306.2	597.7
Re-Exports	61.5	7.4	23.3
Retained Imports	858.0	1,298.8	574.4

The increase in re-exports in 1945 as compared with 1944 was largely due to the shipment of relief goods to liberated countries in Europe. Effective from July 1, 1945, prewar rates of duty were restored on a variety of imported products that had entered Britain duty-free during the war because they had been brought into the country exclusively for war purposes. Value of the export trade in 1944 and the first half of 1945, compared with 1938, is shown in the following table:

	Exports from the United Kingdom		
	1938	1944	Jan.-June 1945
	(In £ millions)		
To British Countries	234.7	169.8	98.9
To U.S.A.	20.5	17.7	8.5
To other countries	215.6	70.6	65.6
Total	470.8	258.1	173.0

Exports of essential goods to liberated countries in Europe accounted for £28 million in the first half of 1945; while the greater part of these shipments were consigned to France and Belgium, not all goods sent to Belgium were destined for consumption in that country. Exports in the first half year also included special consignments of machinery and other equipment to Russia and exports to the United States under mutual aid; these, together with the exports to liberated countries, accounted for more than one fifth of the total exports. Export licensing regulations were relaxed, on June 8, 1945, on several hundred items including raw materials, semimanufactured products, and manufactured goods.

Transportation.—The railroads (with an aggregate mileage of 19,132), and the London Passenger Transport Board, were under government control during the war, the Treasury paying the joint undertakings a fixed annual rental totaling £43,469,000. For the year ended Dec. 31, 1944, pooled receipts amounted to £394,360,000, and expenditure was £301,167,000; the net revenue of the pool, after deduction of rents, interests, and other miscellaneous items, was £90,256,000,

and thus the national exchequer made a profit of £46,787,000 from the controlled undertakings. The railroads own 953 miles of canals and other inland waterways have a length of 1,425 miles, giving a total of 2,378 miles. Highways in Great Britain have a total mileage of 180,527 (27,545 first class), of which 154,566 are in England and Wales and 25,961 miles in Scotland. Britain suffered a net loss of one third of her merchant shipping during the war; she commenced with 21,000,000 gross tons and built 5,723,000 tons, but (down to May 8, 1945) lost 12,500,000 tons. Most of Britain's largest ships, however, survived.

The railroads operate steamship, motorbus, and internal air services. During the war the aircraft of railroad air services and associated companies flew 6,000,000 miles without loss of life except on one occasion through enemy action, and carried 250,000 passengers and 6,000,000 pounds of cargo and mail. The British Overseas Airways Corporation, a nationalized undertaking, operated all external services during the war. Provisional figures for 1944-45 (contrasted with the actual statistics for 1940-41) include the following: capacity ton-miles, 52,831,095 (8,375,290); passenger ton-miles, 19,125,889 (3,345,846); cargo ton-miles, 13,527,532 (2,161,701); mail ton-miles, 6,296,272 (783,397); passengers carried, 99,500 (19,834); pounds of cargo carried, 13,137,600 (1,003,520). Lord Winster, the Labour government's minister of civil aviation, announced in the House of Lords on Nov. 1, 1945, that all air services, internal and external, were to be nationalized. Health Row, in Middlesex, 14 miles west of the center of London, became Britain's principal civil airport on Jan. 1, 1946.

In the House of Commons, also on November 1, Hugh Dalton, chancellor of the exchequer, stated that the government, adopting the recommendation of the Commonwealth Telecommunications Conference earlier in the year, proposed to acquire the worldwide telecommunications services operated by Cable and Wireless, Limited. The internal telegraph and telephone services of Great Britain have long been a state-owned enterprise managed by the Post Office Department.

Principal Events.—The sweeping victory won by the Labour Party in July 1945 was given it by a people utterly wearied after six years of war and hopeful that by a change of government it could ensure security and far-reaching measures of social reform. All the new leaders had gained experience in Winston Churchill's coalition government. Prime Minister Attlee, intelligent and honest, though somewhat colorless, was backed up by two strong administrators, Ernest Bevin and Herbert Morrison, upon whom major responsibilities would certainly fall; while outside Parliament the Cabinet was supported by Harold Laski, chairman of the party's executive committee, and others who had been long in the inner councils. The new government had secured a broad base of public support, and was likely to be given opportunity to implement its campaign pledges.

The first fruit of victory for the British people proved to be still greater austerity. Food rations had been cut drastically in May, meat supplies per head per annum being reduced to 100 pounds (162 pounds in the United States), and supplies of bacon, cooking fat, soap, and milk also being lowered. By August, with the war against Japan ended, sugar supplies were again reduced, and clothing was rationed down

GREAT BRITAIN

In London, workmen are putting the finishing touches to the roofs of temporary huts. These huts are being built on bombed sites, and the existing electricity and water mains are being utilized.

Modern British school design is well exemplified in this picture of a country boys' school in Kent. The glass enclosure on the right, while adding to the beauty of the construction, houses the main staircase.

Nearly everywhere in Great Britain, housewives are queuing for fish, for fruit, for cakes and buns, even for the humble potato. For the most part, they line up cheerfully and are philosophic about their frequent disappointments.

In the shadow of St. Paul's Cathedral, an electrically driven stonecutter is at work, and alongside it is a huge pile of portland stone which has been collected from some of London's bombed churches. This stone is being cut and reshaped, and is to be used in the reconstruction of London.

Builders have completed the steel framework and window frames of two of London's first prefabricated modern semi-detached houses, with up-to-date plumbing, electric light, bathrooms, refrigerators, and central heating.

Crowds cheer the successful candidates after the declaration of the poll at Stepney on July 26, 1945. Rt. Hon. Clement R. Attlee and Mrs. Attlee in center of the picture.

to a point equal to only one third of normal prewar consumption; and early in October motorists were told that gasoline rationing must continue for an indefinite period. On October 15, Parliament extended the wartime controls by the government for a further five years. For that period the government was empowered to regulate the prices of food, clothing, labor, and building materials, to requisition housing, to decide the types of work done in factory, and to restrict workers in their choice of jobs. Such vast powers had never before been given to a British government in times of peace. Conscription for the armed forces was not abandoned with the end of the war, youths of 18 being called up, and also men to the age of 30 hitherto employed in the munition industries. In October, two months after taking office, the Labour government introduced in Parliament a bill to nationalize the Bank of England, one of the principal Socialist measures promised during the election campaign. Although the Bank of England was the banker of the British government, the latter was not represented in its management and did not share in its profits, the bank thus possessing great powers to influence the working of the national economy. A considerable body of public opinion held that such authority should not lie in private hands and therefore supported the bill introduced into Parliament on Oct. 10, 1945, vesting complete responsibility for the financial policy of the Bank of England in the government. The bill would permit the government to appoint the members of the bank's controlling body and to acquire the outstanding stock of the bank, valued at £14,553,000, in exchange issuing 3 per cent bonds to the value of £58,212,000; subject to redemption at par at the discretion of the government on or after April 5, 1966, the bonds would be perpetual. Since stockholders had averaged a gross return of 12 per cent on their holdings, issuance of 3 per cent obligations to four times the value of the holdings would assure them return equal to that which they had previously enjoyed.

Traitors.—William Joyce, throughout the war a broadcaster for the Germans nicknamed "Lord Haw Haw" by the British, was brought to trial for treason in September. Despite the fact that he had claimed to be a British subject on several occasions when applying for passports, he asserted in court that, in fact, he had been a United States citizen until 1940, when he became a naturalized German. Sentenced to be hanged, he appealed the sentence through all courts up to the House of Lords; these efforts failing, he was hanged on Jan. 3, 1946. A treason was entered, however, by John Amery, son of Lionel S. Amery, who has been for many years a highly regarded member of British governments; he was executed by hanging on Dec. 19, 1945. A third British traitor brought to trial was Norman Baillie-Stewart, also charged with treason; a former officer of the Seaforth Highlanders, who had been sentenced to five years' imprisonment in 1933 for imparting military information to Germany, he became a German citizen a year before Britain declared war. By reason of this fact he did not hang, on Jan. 10, 1946, a sentence of five years' penal servitude being imposed upon him.

Foreign Relations.—There was little change in British foreign policy after the Labour government had succeeded a Conservative administration. Prime Minister Winston Churchill's position on international questions had reflected the collective opinion of his War Cabinet, in which

Labour was fully represented, and Clement Attlee and his colleagues, even in the first flush of victory, were quick to pay tribute to Churchill's conduct of the war and foreign affairs. With rare exceptions, Britain was ranged alongside the United States at the San Francisco Conference and numerous other international gatherings. At the Potsdam Conference, Prime Minister Churchill and Foreign Secretary Eden, and their successors, Attlee and Bevin, were in complete agreement with President Truman and Secretary of State Byrnes, and at the abortive Council of Foreign Ministers, in London, the policies of the Anglo-American statesmen generally coincided. However, in matters concerning the two countries almost exclusively there was less unanimity. Thus, in the fields of postwar aviation and communications opinion diverged widely, and at the Anglo-American Conference on Finance and Trade, Britain did not accept the views of the United States on such subjects as the sterling bloc and imperial preference.

While Britain had American support (generally in opposition to the views of the Soviet Union) in matters concerning Germany, Italy, and the Balkans, during 1945 she was playing a lone hand in Greece, where British troops upheld the authority of the regent. British forces were also being employed, after Japan's surrender, to help restore French rule in Indo-China and Dutch power in the East Indies. The Labour government was also confronted with a difficult situation in the Middle East, where the Arab League (q.v.) had become an influential factor in British problems relating to Egypt and Palestine (qq.v.).

Interesting disclosures regarding Britain's relations with the Vichy government in 1940 were made five years later. In May 1945, on the eve of the Paris trial of Marshal Pétain, Louis Rougier, a French professor domiciled in New York City, published in Montreal a book entitled *Les Accords Pétain-Churchill* alleging a secret "gentleman's agreement" between the two statesmen which had prevented France from joining the Axis and the French fleet from falling into German hands. Rougier, who claimed to have acted as the intermediary in the negotiations, included in his book a photostatic copy of the first page of what he declared was the note drawn up by him which Churchill had approved and which he gave to Pétain. The prime minister refuted in the House of Commons on June 12 the assertion that he had concluded a secret agreement with Pétain, but did not deal with the documents published by Rougier. The Foreign Office clearly indicated that there had been a hoax, declaring that what purported in the book to be a photostatic copy of the note to Pétain (the "gentleman's agreement") was in fact the first page of a note of arguments to be used by Rougier in an interview with General Weygand, Vichy high commissioner in French North Africa; the word "Weygand" had been blacked out in the heading of the photostat document, originally titled "Entretien avec Weygand." To clarify the whole affair, the Foreign Office published the text of its own duplicate copy of the Pétain note which Rougier prepared in London, and the highly different version which Rougier gave in his book.

Britain and Atomic Energy.—With the war's end Great Britain, no less than the United States and Canada, was resolved to continue research on atomic fission and to keep her knowledge to herself—or, at any rate, away from those who might conceivably misuse it. The Tube Alloys Direc-

torate, the camouflaged name for the organization of British scientists who had shared in development of the bomb, was transferred in November from the Department of Scientific and Industrial Research to the Ministry of Supply and continued experimental work near Didcot, Berkshire, 53 miles southwest of London. In the House of Commons on November 7 Winston Churchill, as leader of the Opposition, and Foreign Secretary Bevin, endorsing President Truman's Navy Day speech on the 12 fundamental points of America's foreign policy, agreed that the three countries should keep the atom bomb secret until the United Nations Organization (UNO) had been so strengthened that it could be shared. This position was further emphasized when the British and Canadian prime ministers visited the president in Washington the following week; in a tripartite statement they announced that the secret would be withheld until "effective enforceable safeguards against its use for destructive purposes can be devised."

While in Washington, Clement Attlee addressed a joint session of Congress, telling its members that their country "stands out as the mightiest power on earth and yet America is a threat to no one" and explaining to them the aims of the British Labour Party, of which he was the spokesman. He also asserted that the UNO "must be an expression of the will of the common people in every country," and this theme he reiterated in the House of Commons on November 22, warning that the UNO will fail unless the nations "determine to establish between themselves such mutual confidence that war is unthinkable." Anthony Eden, speaking from the Opposition benches in the debate that followed, urged the abandonment of narrow ideas of national sovereignty, and the next day Ernest Bevin, Eden's successor in the foreign secretaryship, pledged British support of a directly elected world assembly as a step beyond the UNO. The first stage, however, was to organize the UNO, and in order to prepare for the first sessions of its General Assembly in January 1946, a preparatory commission representing 51 nations convened in London on Nov. 24, 1945. At that time, unquestionably, the world outlook was less promising than it had been after the First World War. In particular, London shared Washington's uneasiness at the unco-operative attitude of the Soviet Union, and every step which could be taken to ensure wider collaboration among all nations was certain of maximum support by Great Britain. In fundamentals, British objectives were identical with those of the United States—and the two countries called upon others, as Ernest Bevin expressed it, "to really put the cards on the table face upwards."

WHEELER B. PRESTON,
Author and Publicist.

GREECE. This southeastern European country has an area of 50,147 square miles and a prewar population estimated at 7,535,000, considerably decimated during the war. It became an independent monarchy in 1830 after its liberation from Turkey. On March 25, 1924, a republican regime was proclaimed which lasted until the restoration of the monarchy in November 1935. In 1936 dictatorial powers were assumed by Premier Metaxas, and parliamentary government was suspended, though King George II remained on the throne. Italy invaded Greece through Albania on Oct. 28, 1940, but by April of the following year, the Greeks had driven the

Italians back into Albania. Then Germany attacked Greece and, within a month, practically the entire country was in Axis hands. King George, having fled with his ministers, formed a government-in-exile headed by Emmanuel Tsouderos. In April 1944, following a controversy over the King's status, Tsouderos was succeeded by Themistocles Venizelos, who, shortly afterwards, was replaced by George Papandreou. In the fall of 1944 British forces landed on the Peloponnesus, and, in collaboration with Greek patriots, expelled the Nazis from the country. The king remained in London pending the results of a plebiscite, but the Papandreou government accompanied the British to Athens. No sooner was the cabinet installed than a civil war broke out between the ELAS, military arm of the leftist EAM, and the factions supporting the King and Papandreou. Soon the British, under General Scobie, joined the forces opposing ELAS and fierce fighting broke out in the streets of Athens. On Christmas Day, Prime Minister Churchill and Foreign Secretary Eden flew to Athens in an effort to resolve the crisis. Upon their return to London, they prevailed upon the Greek king to nominate Archbishop Damaskinos, primate of Greece, as regent.

Principal Events in 1945.—Following the establishment of the regency, Premier Papandreou and the entire Cabinet resigned, and on January 3 the regent appointed Gen. Nicholas Plastiras as Prime Minister. Meanwhile the British had driven the ELAS forces out of Athens, but the fight continued north of Thebes. On January 11, a truce was concluded with General Scobie, providing for the cessation of hostilities, for the exchange of prisoners, and for the evacuation by ELAS of the east coast of Greece including Salonika, northern Peloponnesus, and most of the islands. The ELAS would not agree to freeing civilian hostages, although later they permitted the release of all but about 100 "quislings." On January 12 the EAM, under British pressure, signed an accord with the Plastiras government at Varkiza, providing for the disarming of ELAS forces, the legal recognition of EAM as a political party, a plebiscite on the monarchy, a general election, immediate prosecution of Axis collaborationists, and an amnesty to all political offenders, excluding persons guilty of civil crimes. Having thus weakened the ELAS as a militant factor in Greek affairs, pressure now developed to force Plastiras out of office. He was accused of ruling like a dictator; actually he was opposed by the royalists who saw in the incumbent premier an obstacle to the return of the king. Eventually Plastiras gave way to a "service" government headed by the royalist sympathizer, Vice Admiral Petros Voulgaris. The advent of the new government failed to bring about political or economic stability, however. Protests were voiced over the government's repressive measures and its failure to effectuate the Varkiza agreement, and strong partisan differences developed between the royalist factions which asked for an immediate plebiscite for the return of the king, and the opposition which insisted that general elections should precede the plebiscite. In July, several ministers left the Cabinet, explaining that the time had come for the reorganization of the government along more democratic lines. On the economic front, the country experienced a new wave of inflation and currency depreciation, notwithstanding the efforts of Deputy Prime Minister Kyriakos Varvaressos to institute rationing, price controls and a special levy on wealth.

Greece also experienced difficulties in its relations with its neighbors. Marshal Tito and the Bulgarian government issued excoriating statements against the Greek government for alleged persecution of the Slavic minority in Greek Macedonia. These charges were officially denied by the British and Greek governments, which saw in the agitation among the Slavs a mere attempt on the part of Tito and the Bulgars to justify their designs on Greek territory. The Soviet's seeming acquiescence to these designs further complicated the situation.

The advent of Labor to power in Great Britain did not materially alter the Churchill policy toward Greece. Foreign Secretary Ernest Bevin declaring himself in support of the Voulgaris government and of the British policing of Greece. At British suggestion, however, the Greek government issued a decree (characterized as mockery by Moscow), granting general amnesty to political offenders, except persons charged with felonies. The British also expressed preference for the postponement of the plebiscite until after the general elections. In August, the U.S. State Department announced that the United States, Great Britain and France were to send commissioners to Greece to supervise the elections. The Soviet Union declined to join. In the fall, Archbishop Damaskinos arrived in London to consult with the British and to present reparation and territorial claims to the Council of Foreign Ministers. The council experienced a deadlock and adjourned, however, without reaching any accord on Balkan problems.

On October 9, Premier Petros Voulgaris and his cabinet resigned, forced by the refusal of the Liberal Party to participate in the elections set for January 20, 1946. After repeated unsuccessful attempts on the part of Archbishop Damaskinos, Regent of Greece, to find a successor to Voulgaris, the Regent announced, on October 17, that he himself was assuming, temporarily, the office of head of the government, and proceeded to form a new cabinet consisting of the members of the previous cabinet, excluding Voulgaris. This was the first time in Greek history that a clergyman headed a cabinet.

Production, Trade and Finance.—Agriculture normally employs 60 per cent of the population and contributes over two thirds of the national income. Less than one fifth of the country's area is arable. The crops most suited to Greek soil and climate are olives, grapes, and their derivatives (olive oil, wine, currants, and raisins), citrus fruits and nuts, and, most important of all, tobacco. Two thirds of the cultivated area is sown to cereals, chiefly wheat. Before the war, Greece manufactured textiles in very considerable quantities, leather goods, foods, liquor, chemicals, paper, and cigarettes. It also produced bauxite, chromium, iron ore, lignite, magnesite, nickel, and pyrites. Its exports—consisting chiefly of tobacco leaf, currants, raisins, and olive oil, and destined primarily for Germany, the United States and the United Kingdom—amounted to about 75 million United States dollars. Imports—comprising manufactures, cereals and fuels, and shipped mainly from Germany, the United Kingdom, and the United States—amounted to about 100 million United States dollars. A well-developed banking system operated the Bank of Greece, 27 commercial banks with numerous branches, 2 mortgage banks, the Agrarian Bank and a number of savings institutions. The nation owed an enormous foreign debt, held mostly by British investors, in default for a number of

years because of difficulties in making the transfer. The total railway mileage in operation was 1,818 miles and the Greek merchant marine ranked ninth in world tonnage with a gross displacement of 1,837,000 tons. Greece also had 8,440 miles of highways, 14,976 miles of telegraph lines, 7,500 miles of telephone lines and 13 airfields.

The Aftermath of the War.—After the Axis occupation of Greece, the country's best tobacco lands were annexed by Bulgaria (restored in 1944), and agricultural productivity in general fell to one half of its prewar levels. Manufacturing also suffered heavily from lack of raw materials, fuels, and the removal of machinery by the Axis. In fact, all movable goods, ships, railroad stock, food, and equipment were systematically plundered by the Nazis and most of the ships that escaped were sunk by Axis submarines. Official reports indicate that 1,500 villages were wiped out, that 500,000 Greeks were slain or died of privation, and that fully 30 per cent of the nation's wealth was destroyed. Foreign trade, except for goods going to Germany, disappeared. The Germans took control of the banks, imposed fantastic levies to defray occupation costs, and flooded the country with worthless paper money.

In 1945 Greek economic life was still in a state of paralysis. Although official figures are still lacking, agricultural production was estimated far below its prewar level due to a severe drought and to shortage of supplies. It was expected, however, that soon tobacco culture would be restored to normal production. Such industrial plants as had escaped destruction were idle for lack of materials, industrial unemployment was widespread, and the relief measures undertaken by the UNRRA were handicapped by the complete breakdown of the transportation system. As a result, serious malnutrition still prevailed and infant mortality was reported high. The new drachma was first pegged at its value in 1940 (about 150 to the U.S. dollar) and later at 500 to the U.S. dollar. Twelve billion new drachma are reported to have been issued, backed by ample gold; but shattered public confidence, political instability, and widespread social unrest, threatened a new and disastrous inflation, with prices rising and the gold sovereign reaching 28,000 drachmas in the black market. Relief by the UNRRA, envisaging the distribution of \$245,000,000 worth of food and supplies in 1945, and the extension of a \$250,000,000 loan by the United States, will, it is hoped, bring a measure of recovery to Greek economic life.

HOMER P. BALABANIS,
Humboldt State College, Arcata, Calif.

GREENLAND. Largest island in the world and only colony of Denmark (q.v.), with an area of 736,518 square miles, of which only 31,284 are ice-free land; estimated population in 1940, about 18,000, including some 600 Danes and about 250 Eskimos. It is divided into three districts, North, South, and East. The capital is Godthaab (pop. 1939, 1,300). In 1932 Norway occupied and laid claim to a portion of East Greenland. Denmark protested to the Hague Tribunal, which decided in favor of Denmark, and Norway abandoned the settlement. The trade of Greenland is a state monopoly of Denmark. After the German occupation of Denmark in 1940, trade activities were carried on by the Greenland section of the Danish Consulate General in New York. Apart from cryolite (a

mineral used in the manufacture of aluminum, of which Greenland possesses the only existing mine), the chief products are seals and seal skins, blue and white fox skins, fish and animal oils. In 1944 Greenland exported 3,450 blue fox skins (of which 460 were grown on farms), 1,732 white fox skins (including 5 grown on farms), and one-half ton of cleaned eider down. During the fiscal year, April 1, 1944, to March 31, 1945, Greenland exported 3.1 tons of cod liver oil, 162 tons of cod livers, and 1.7 tons of shark livers.

From April 9, 1941, under an agreement with the Danish minister at Washington, Greenland was placed under the protection of the United

May 22, 1945, and two days later committed suicide. It is believed that he took the same type of poison as the Gestapo chief, Heinrich Himmler.

GRENADA AND GRENADINES. See **WINDWARD ISLANDS**.

GROUP INSURANCE. Group insurance has continued to grow in popularity and in the variety of its coverages. The following chart shows the number of master policies, number of certificates issued to individuals, and the total volume in force in the several classifications of life, casualty and annuity business as of Dec. 31, 1944, the latest date for which figures are available.

GROUP INSURANCE IN FORCE IN THE UNITED STATES AND CANADA AS OF DEC. 31, 1944

	Number of Master Policies	Number of Certifi- cates	Volume in Force
Group Life Insurance (including Group Indebtedness Insurance).....	38,500	15,300,000	\$25,600,000,000
Group Accident and Sickness Insurance.....	18,600	6,500,000	\$ 105,600,000 (Weekly Indemnity)
Group Accidental Death and Dismemberment Insurance..	14,500	3,200,000	\$ 5,250,000,000 (Principal Sum)
Group Hospital Expense Insurance and Surgical Benefits for employees and their dependents: Daily Room and Board Benefits			
For Employees	18,000	4,900,000	\$ 21,700,000
For Dependents	8,700	1,400,000 (Family Units)	5,300,000
Surgical Benefits			
For Employees	17,600	4,300,000	\$ 641,000,000
For Dependents	2,400	530,000 (Family Units)	\$ 67,700,000 (Maximum Benefits)
Group Annuities.....	2,033	1,450,000	\$ 277,660,000 (Annual Income at Maturity)

States, which acquired the right to establish American air bases and other naval and military facilities, on the understanding, however, that Greenland would remain a Danish colony. On May 5, 1944, it was announced that American air bases begun in 1941 had been completed. Greenland thus became an important link in the chain of air highways encircling the globe.

On June 26, 1945, Denmark's sea communications with Greenland were re-opened with the reported departure from Copenhagen of a schooner carrying a mixed cargo. The first passenger ship, with a group of explorers, artists, and scientists, and a number of Greenlanders returning to their native country after an enforced five-year stay in Europe, was scheduled to leave a few days later.

GREENWOOD, Arthur, British political leader, and since labour's victory in Britain's 1945 general election, lord privy seal in the Attlee Cabinet. He has been deputy leader and acting chairman of the Labour Party since 1942, and treasurer since 1943; he is also secretary of the party's research and information department. From 1940-42, he served in the Churchill War Cabinet as minister without portfolio. He is one of the Labour Party's most popular members, a scholar and an organizer of educational programs for members of Britain's working classes. He was minister of health, 1929-31. Mr. Greenwood is author of a number of books, among them *The Labour Outlook* (1929), and *Why We Fight: Labour's Case* (1940).

GREIM, Robert Ritter von, German Army officer: d. Salzburg, Austria, May 24, 1945. Field Marshal von Greim was successor to Hermann Göring as head of the German Luftwaffe. Wounded in the leg during the final stages of the battle for Berlin, he was discovered in the Luftwaffe hospital in Kitzbühel, Germany, on

These figures show a new high record of volume in force for each classification listed with the exception of group accident and sickness insurance.

Group Accident and Sickness Insurance.—The number of lives covered under group accident and sickness insurance policies has been maintained at 6,500,000 but the amount of weekly indemnity has been reduced about \$1,400,000. This reduction in volume of a little over 1 per cent over approximately the same number of lives covered reflects in part the efforts of the insurance carriers to keep the amount of weekly indemnity in conformity with the basic weekly earnings rather than to increase the indemnity to match up with higher earnings caused by payment of overtime pay, bonuses, etc. A corrective for the loss ratio on accident and sickness insurance was in order since this one division of group insurance was showing more than an expected loss ratio.

Loss Ratio.—The loss ratios on all forms of group insurance other than accident and sickness have all been satisfactory and large credits have been allowed on these policies in the form of dividend returns and rate reductions.

Group Medical Reimbursement Insurance.—During the past year expansion of group insurance has appeared in the form of medical reimbursement insurance, a plan designed to reimburse the individual employee for modest medical fees such as \$2 for a visit to the doctor's office or at a hospital and \$3 for the doctor's visit to the home. A recent enlargement of this feature has been the extension of these benefits to the dependents of employees to include wife and children between the ages of three months and 18 years. There is a limitation to the number of calls, usually 50 calls in a calendar year.

Surgical Reimbursement Insurance.—As a result of increased experience in this new group field

some policies were introduced in 1945 providing for a scale of increased benefits at correspondingly higher premiums.

Group Life Insurance.—Bills for the legal extension of group life insurance benefits to provide some death benefit for the dependents of the insured employee have appeared in a few legislatures and enacted into law by one, California, in its 1945 session. The statutory minimum of 50 lives has been reduced to 25 in a few states and the definition of group insurance has been amended to apply more broadly to cover certain types of groups. These enlargements in statutory privileges, however, leave the question with the underwriters as to what would be deemed desirable in the way of further reduction in the minimum number of lives accepted under group underwriting rules. Admittedly it is desirable to cover employees of small concerns but the question of accepting lives without medical examination introduces other underwriting considerations which thus far have limited the inclusion of groups of under fifty. An intermediate form of individual insurance is available with some companies for groups over 10 but under 50 lives in the form of wholesale insurance where the selection of the lives is on a modified medical examination.

Group Indebtedness Insurance.—Group indebtedness insurance to date has largely been utilized by banks to insure unpaid installments on their personal loan business but this coverage now is leading more broadly into the field of installment buying, opening up another avenue of group business offering possibilities of broad development.

Group Ordinary Insurance.—Interest in applying plans of group insurance on other than the one year term rate continues, but outside of pension trust business there has not been any considerable volume of such insurance written.

Group Annuities.—The great growth in group annuity plans reflects both the need and desire of insured benefits to supplement social security benefits and also reflects the increasing popularity of pension plans underwritten by insurance companies.

WILLIAM J. GRAHAM,

Vice President, Equitable Life Assurance Society of the United States.

GUADALCANAL. See WESTERN PACIFIC ISLANDS, BRITISH, Section 1.

GUADELOUPE. A French colony in the Lesser Antilles, West Indies, consisting of the two islands, Guadeloupe proper and Grande Terre, separated by a narrow channel called Rivière Salée. The area is 583 square miles and the population (1936) 304,239. Five smaller islands attached to the colony make the total area 688 square miles. The inhabitants are French citizens. Guadeloupe, like Martinique, sends two deputies and one senator to the French Parliament. Guadeloupe is administered locally by a governor and an elected general council, the seat of government being Basse Terre (pop. 13,638), on Guadeloupe Island. The general council and the municipalities (36 communes) are of the French type. Education is provided by two lycées, and a secondary course for girls, and 129 public and private elementary schools, with 22,817 pupils. Bananas, tobacco, and most of the native vegetables are grown in large quantities, and cattle are produced in sufficient numbers to provide a regular meat ration for the whole population. In 1938 imports amounted to 250,583,000 francs,

exports to 296,472,000 francs. In May 1945 Guadeloupe, Grand Terre, and the island of Marie Galante were reported to have a total of 1,189 kilometers of roads, of which 309 kilometers were all-weather roads. In 1938 the colony had 59 post offices and 9 wireless stations. The Bank of Guadeloupe is the official banking institution, but the Royal Bank of Canada also has established a branch in the colony. In November 1944 the general council adopted a loan in support of an extensive program of public works, begun in 1931, calling in its revised form for an expenditure of 240,000,000 francs. Work on this program, which was resumed in 1944, and continued in 1945, includes modernization of the port of Pointe-à-Pitre on Grande Terre (pop. 44,551), construction or repair of roads and bridges, electric power lines, and public buildings, and reclamation of 450,000 square meters of flood lands. In the budget for 1945, receipts and expenditures balanced at 199,377,000 francs, as compared with 137,966,000 francs for 1944. (In August-September 1945, 1 franc equaled about 2 cents in U.S. money.) Expenditures for public works amounted in 1945 to 10,000,000 francs, as compared with 7,300,000 francs in 1944.

GUAM. Largest and most southerly island of the Mariana Archipelago in the mid-Pacific, ceded by Spain to the United States Dec. 10, 1898, and subsequently a United States naval station. It was captured by the Japanese, Dec. 7-12, 1941, retaken by United States forces, July 21-Aug. 9, 1944 (the first United States possession retaken by her forces in the Second World War), and during 1945 figured as advance headquarters United States Pacific Fleet and Pacific Ocean areas.

Guam is 30 miles long and 4 to 8½ miles wide, with an area of about 225 square miles. It is 1,501 miles east of Manila and 1,353 miles south of Yokohama. In 1941 the total population was 23,394, of whom 21,999 were classified as native, the remainder comprising naval personnel and non-native civilians. The Guamians (Chamorros), of whom 95 per cent are Roman Catholics, have Chamorro as their native language, using also some Spanish and English, the last-named being the official language. Before the Japanese invasion 4,953 pupils were registered in the schools, elementary education being compulsory. The island was governed by a naval officer, a presidential appointee, who was also head of the military forces and of the naval station, and had its own courts. Agaña, the chief city and seat of government, had in 1941 a population of 12,553. Port Apra, 8 miles distant, was the main anchorage. The island normally produces a wide variety of grains and fruits as well as tobacco, cassava, sugar cane, and valuable woods, and before the Japanese invasion had 7,718 head of cattle.

During the period of Japanese occupation many of the inhabitants were forced into slave labor. Their schools were closed, or reduced to labor-recruiting centers, their food supplies confiscated. By the time of the return of the United States forces thousands of the Guamians, fearing massacre by the Japanese, had taken to the woods, and were facing death from starvation and disease. Agaña, their chief town, was almost completely destroyed during the naval bombardment which preceded the invasion by the United States forces. Within a year after July 21, 1944, when the Americans had established their first

beachheads on the island, great strides had been taken toward rehabilitating the population.

Intensive construction activities of the armed services, moreover, had been transforming Guam into one of the most powerful of advanced bases. The island now had a ring of coast defense artillery, hundreds of antiaircraft guns, a unique system of communications, and eight large air bases. Port Apra, in respect to the volume of cargo handled, had become the world's leading advanced port area. Space for huge battle and transport fleets had been obtained by removing from the harbor about 6,000,000 cubic yards of coral. Transport vehicles in use on the 150 miles of new or improved highways included 3,600 jeeps, and 28,000 trucks, with 3,000 trailers (some of 40- to 60-ton capacity), in addition to heavy traction and trans-shipment machinery. The water supply system was delivering 10,000,000 gallons a day for current needs, with an additional quota of 30,000,000 gallons a month to the harbor and the fleet, and was to be developed to a daily capacity of 60,000,000 gallons. Each month about 15,000,000 gallons of aviation gasoline were being pumped by tankers through 51 miles of pipelines to the airfields, one of which alone required 700,000 gallons each day. The hospitals, all begun since July 1944, already had accommodation for 11,819 cases, which was to be increased to 13,200, with a personnel of 6,100 men and women. A Naval Medical Research Unit, held by naval authorities to be the only one of its kind, with a staff of 44 officer-scientists, was working on the task of preventing as well as curing disease in the Pacific area. Guam also had two large radio stations, a short-wave station in direct contact with San Francisco, and a local station (linked with the Pacific Ocean network) which provided music and other entertainment for the thousands of troops stationed on the island. See also *JAPANESE SOUTH SEA ISLANDS—Marianas Islands; WORLD WAR, SECOND*.

GUATEMALA. The northernmost Central American republic, with an area of 48,290 square miles and an estimated population (1943) of 3,450,732, of which almost 60 per cent are full-blooded Indians and practically all of the rest mixed Indian and white; the percentage of pure whites is very small. Guatemala was the leading province of the Spanish colonial captaincy general of that name and its capital, Guatemala City (pop., 201,430) became the seat of government of the Central American confederation, 1823-38. The province became an independent state in 1839. The constitution of 1879, frequently amended, prevailed until the adoption of a new constitution, March 11, 1945. The new law provides for a president to serve a six-year term and be ineligible for 12 years thereafter, a council of ministers of state under partial responsibility to the congress, a unicameral legislature, and a judiciary headed by the Supreme Court of Justice, members of which are chosen by the congress. The constitution contains an extensive bill of rights and seeks by elaborate provisions to prevent a return of presidential domination. In addition to the capital city, other important cities with the latest estimates of population are: Puerto Barrios (15,784), Quezaltenango (47,822), Cobán (45,228), and Zacapa (53,262).

Religion and Education.—Roman Catholicism is the predominant form of worship but complete religious liberty has prevailed for many years.

Educational statistics for 1943 (the latest

available) showed 2,520 primary schools with an enrolment of 140,736; 69 intermediate schools with an enrolment of 6,552; and one university (at Guatemala City) with an enrolment of 594; there are also various normal, commercial, and vocational schools. The revolutionary junta which came into power in October 1944 and continued in office until the inauguration of President Arévalo in March, 1945, adopted a comprehensive law early in the latter month, providing for a four- to six-year campaign against illiteracy. The program is based on that recently adopted in Mexico and established a scheme of awards of merit and also penalties for noncompliance.

Communications.—The total railway mileage is 737, much the largest portion of that being operated by the American-controlled IRCA (International Railways of Central America), providing connections between the capital and Puerto Barrios, the Caribbean port, and also with El Salvador. Highway mileage totals 3,882; the new administration has made appropriations for improving portions of the Pan American Highway and also for construction of utility roads in the Petén region to open important mahogany-producing areas for exploitation. Guatemala has 235 telegraph offices with 4,079 miles of line, and 2,327 telephones. Air mail and passenger services connect Guatemala with Mexico and the United States to the north and with other Central and South American countries to the south. Chief aviation companies are Pan American Airways, which by September 1945 was operating 56 weekly flights between Guatemala City and Panama, and TACA (Transportes Aéreos de Centro América). Automotive vehicle registration in 1943 was 4,338; there were an estimated 40,000 radio sets and a newspaper circulation of 25,000.

Production.—Guatemala, primarily an agricultural country, has as its chief crops corn (almost entirely for local consumption), coffee, bananas, sugar cane, chicle, and cacao; also important in the local diet are beans, rice, and potatoes. Until the outbreak of the Second World War, bananas and coffee were more or less on a par in value of exports, but lack of shipping facilities has since that time put coffee, at least temporarily, far in the lead. Estimates of coffee production during the 1944-45 season (October through September) were 996,666 bags of 60 kilograms; production in the 1943-44 season was 985,210 bags; exports from October 1944, through April 1945, were 418,686 bags, a decline of 20.8 per cent from figures for the corresponding period in 1943-44. Most exported coffee goes to the United States and under the Inter-American Coffee Agreement, Guatemala's basic quota is 535,000 bags of 60 kilos. This figure has been increased for the 1944-45 season to 754,206 bags. In the 1943-44 season the final quota was 705,248 bags, of which 698,325 bags went to the United States; this figure equaled 4 per cent of all United States coffee imports. United States coffee imports from Guatemala have consistently exceeded the basic quota in recent years, the figures being: 1943-44, 130.53 per cent; 1942-43, 151.47 per cent; 1941-42, 131.21 per cent. Most of the coffee is grown at an intermediate altitude. Banana exports in 1944 totaled 4,495,078 stems, a great increase from the figure for 1943 (2,664,314 stems), due chiefly to the improvement in the shipping situation. Banana exports in 1940 reached 8,208,517 stems. Exports of chicle, used as a base for chewing gum, totaled 3,480,295 pounds in 1944, a slight increase from the 3,335,823 pounds exported in 1943. All of the chicle

goes to the United States, the greater part of it being produced in the Petén region in northern Guatemala. The northern portion of the country is also the principal timber-producing region, the leading woods being mahogany and cedar. Production of the former in particular has been stepped up because of wartime demands from the United States. Small quantities of rubber were produced in the war years and both the government and the United Fruit Company have taken steps to promote plantation production of rubber. Mineral production is far less important than agricultural production. Salt, one of the principal items, is used almost entirely locally. The government on April 1, 1945, abolished its monopoly on the refining and sale of salt. Conditions governing agricultural and mineral production in 1945 were largely shaped by wartime factors; prices of even the foods produced locally for domestic consumption were increased greatly because of shortages of trucks and tires that interfered with normal distribution. Climatic and other factors also played important parts: a drouth in the early months of 1945 caused shortages of corn, beans, and rice and resulted in speculation in sugar and salt. Serious forest fires in northern Guatemala caused great damage in lumbering areas. Industrial production in Guatemala is relatively unimportant, the chief items being shoes and cotton textiles, cement, soap, processed tobacco products, and furniture. Industrialization has been retarded, especially in the war years, by the inability to get needed raw materials, machinery, and fuels from the United States. According to an industrial census in 1940, the largest number of employes (37,361) was found in food-processing industries and the next largest number (29,830) in the textile industry.

Finances.—Budget expenditures for the year ended June 30, 1945, were increased by 2,175,938 quetzales (quetzal = \$1.00), bringing the total to Q15,257,452; the principal items of expenditure in that fiscal year were for roads, public health, sanitation, and defense. Preliminary estimates of expenditures under the 1945-46 budget were for Q20,801,500 but the budget bill as introduced in the congress called for Q25,412,216; the amount for highways, health, and education represented approximately a Q4,000,000 increase, while the Roosevelt Hospital in Guatemala had an item of about Q1,700,000.

Principal Events.—The year 1945 opened with the revolutionary junta of Jorge Toriello, Maj. Francisco Javier Arana, and Capt. Jacobo Arbenz, who had led the bloody revolution against the provisional government on Oct. 20, 1944, still in power. The junta was preparing to surrender power, following the adoption of a new constitution, to the recently elected President, Dr. Juan José Arévalo, who had been successful in the elections of Dec. 17-19, 1944, with a vote of 256,514 to 20,550 for ex-Ambassador Adrián Recinos, the next highest candidate. The constituent assembly began its sessions Jan. 10, 1945, and completed its work in time for the scheduled inauguration of Dr. Arévalo on March 15. The government on January 23 demanded return by former President Jorge Ubico of a "bonus" of \$200,000 paid him by the National Assembly in 1940, and later raised its demands to \$587,000. Ubico, failing to take action with the 30 days granted him, subsequently faced confiscation of his holdings in Guatemala by the government. Eight opposition leaders, including officials of Recinos' Democratic Party, were arrested February 11 on charges of conspiracy and Recinos was "invited"

to leave the country. President Arévalo, after his inauguration, named three former members of the revolutionary cabinet to his own cabinet and appointed Junta Member Capt. Arbenz as war minister; the cabinet had been reorganized at the end of 1944 to provide for ministries of Economy and Public Health and Social Aid. Jorge Toriello, another junta member, subsequently became Finance Minister. In April 1945, less than a month after Arévalo's inauguration, constitutional guarantees were suspended because of a "reactionary conspiracy" and developments later in the year indicated that the government was taking an increasingly repressive attitude toward opposition elements; numerous persons were exiled in June and July. The government in mid-1945 extended invitations to the other Central American states to attend a Regional Radio Communications Conference to be held at Guatemala City in August, preliminary to the scheduled meeting of the Third Inter-American Radio Communications Conference at Rio de Janeiro in September. The government on Feb. 21, 1945, expropriated Aerovías de Guatemala, a subsidiary of Pan American Airways; this was later reorganized on a national basis. Other nationalistic and similar legislation and actions followed. The government in May began preparation of a comprehensive labor code and also of laws favoring co-operatives and speeding industrialization. A law, effective May 22, 1945, revised regulations dealing with agricultural labor. An Office of Co-ordination of Prices and Supplies was established July 1 to attempt to combat inflationary tendencies.

In the field of foreign relations, probably the most significant development was the changing relations with Spain. On Jan. 23, 1945, the revolutionary junta severed diplomatic relations with the Franco regime; it was thus the first American state to take such action (Mexico had never established relations with Franco). Guatemala subsequently, September 10, granted recognition to the Spanish "government-in-exile" established at Mexico City. The Guatemalan delegation at the Mexico City Conference proposed on February 28 that "undemocratic" regimes be not recognized. Relations with El Salvador, which, under the revolutionary junta, had been quite strained, were smoothed out after recognition by Guatemala of the new regime in El Salvador in April, and soon thereafter the two new presidents began discussions looking to the union of the two states as a forerunner to Central American union. Guatemalan relations with the Soviet Union were re-established by an exchange of notes at Washington, April 19. The new Guatemalan government continued to press the long-standing claim against Great Britain for the return of British Honduras. President Roosevelt on January 22 nominated Edwin J. Kyle of Texas as ambassador to Guatemala; he presented his credentials May 9. On May 21, officials of the two governments signed at Washington an agreement for a United States military mission to Guatemala. Later conversations discussed the "loan" of U.S. price control, statistical, mineral, industrial, and other experts.

RUSSELL H. FITZGIBBON,
Department of Political Science, University of California, Los Angeles.

GUATEMALA-EL SALVADOR UNION. The presidents of Guatemala and El Salvador are reported to have met in June 1945 to discuss a proposal of political union of the two countries. Federations among the Central American nations

are no novelty, as the National Geographic Society points out in a bulletin commenting on the report. All these nations—with the exception of Panama which was part of the Spanish viceroyalty of New Granada and subsequently a province of Colombia until 1903—were originally provinces in the captaincy-general of Guatemala established after the conquest of 1523-24 made by Cortes' lieutenant, Pedro de Alvarado. On Sept. 15, 1821, El Salvador, Guatemala, Honduras, Nicaragua, and Costa Rica jointly proclaimed their independence from Spain and the following year annexed themselves to the short-lived Mexican Empire of Agustín de Iturbide. However, when the emperor-dictator abdicated, they withdrew and, on July 1, 1823, organized the United Provinces of Central America from which Guatemala did not formally secede until almost a year later. Subsequently, between 1839 and 1851, El Salvador was involved in several bitter conflicts with Guatemala in the attempt to re-establish the union.

Though El Salvador, with an area of 13,176 square miles, is the smallest of these republics, it is the most densely populated, its nearly 1,900,000 inhabitants living in an area less than half the size of the state of Maine; it is also the only one of the six that faces but one ocean, the Pacific. Guatemala, on the other hand, with its area of 48,290 square miles (about the size of New York) is one of the three larger states, its population of nearly 3,500,000 giving it more citizens than any of the others.

Coffee comprises about four-fifths of El Salvador's exports, and there is an increasing production of medicinal gum from balsam trees. Guatemala's leading crop is also coffee; but during the war years there has been increased planting of rubber and cinchona trees, with consequent stimulation of exports of rubber and quinine. Both countries, in common with their sister republics of Central America, having an agricultural economy, are endeavoring to develop local industries and create an export market in the United States for their beautiful handwoven and embroidered textiles.

GUERNSEY. See CHANNEL ISLANDS.

GUGGENHEIM MEMORIAL FOUNDATION. The John Simon Guggenheim Memorial Foundation was established in 1925 by former United States Senator and Mrs. Simon Guggenheim as a memorial to their son, the object being "to improve the quality of education and the practice of the arts and professions in the United States, to foster research, and to provide for the cause of better

international understanding." The foundation has headquarters at 551 Fifth Avenue, New York City. Henry Allen Moe is secretary general.

Fellowships are distributed by the foundation annually in the fields of literature, fine arts (painting and sculpture), music and dance, science, history, philosophy, and economics, the stipends usually being \$2,500 a year. A total of 132 fellowships, involving stipends amounting to \$324,000, was awarded to Americans and Canadians in 1945, and it was announced that \$200,000 had again been appropriated, as in 1944, exclusively for men and women serving the nation in the war effort. The winners in this category began their fellowship work at the time of their discharge from war service. Of the 132 award winners in 1945, 77 were in the category of war service winners.

In addition, 21 fellowships were awarded to Latin American scholars and artists, whose stipends are usually \$2,000, plus sums for traveling expenses to the United States and return home. Of the 21 Latin American scholarships, seven were awarded to Argentinians, six to Mexicans, three to Uruguayans, two to Chileans, two to Cubans, and one to a Brazilian.

GUINEA, Spanish. See SPANISH COLONIAL EMPIRE.

GYPSUM. Continued impediments to construction resulted in a 3 per cent decrease in crude gypsum mined in the United States in 1944 compared with 1943, according to the United States Bureau of Mines. The mine production of crude gypsum for 1944 was 3,761,234 short tons valued at \$6,450,767, as compared with 3,877,541 tons valued at \$5,959,615 in 1943. The 1944 calcined gypsum output was 8 per cent lower than in 1943. The production of calcined gypsum in 1944 was 2,363,143 short tons valued at \$13,841,399 as compared with 2,557,730 tons valued at \$14,751,587 in 1943. Uncalcined gypsum products sold or used in 1944 amounted to 1,056,276 short tons valued at \$2,953,564, while 200,473 short tons of industrial gypsum products valued at \$2,550,649 were sold or used during the same period. Building gypsum products sold or used during 1944 amounted to 753,945 short tons valued at \$7,338,740, while 1,828,029 short tons of prefabricated gypsum products valued at \$42,857,266 were sold or used during the same year.

H

HACHA, Emil, Czech jurist and statesman: b. Trhove Sviny, Bohemia (then a part of Austria-Hungary), 1872; d. Prague, Czechoslovakia, June 27, 1945. President of Czechoslovakia from November 1938 to March 1939, and thereafter puppet president of the German "protectorate" of Bohemia and Moravia. Emil Hácha had been arrested by Czech patriots on May 5, 1945, and at the time of his death was awaiting trial on charges of traitorous collaboration.

After receiving the degree of doctor of jurisprudence at Charles University, Prague, in 1895,

Dr. Hácha practiced law for three years and then entered the Austrian state service. He served as legal adviser of the Land Committee of the kingdom of Bohemia (1898-1916) and as legal counselor to the Austrian Court of Administration in Vienna (1916-18). When the Republic of Czechoslovakia was established in 1918, he became Senate president of the Supreme High Court of Administration in Prague. From 1919 to 1925 he was second president of this same court, and from 1925 to 1938 first president, the highest judicial post in the country. In ad-

dition, he was also at one time a judge of the Permanent Court of International Justice at The Hague.

With the signing of the Munich agreement in September 1938 and the subsequent German occupation of the Sudetenland, Dr. Eduard Beneš resigned as president of Czechoslovakia in the face of German diplomatic pressure. The National Assembly was convoked on Nov. 30, 1938, and elected Dr. Hácha president by 272 out of 312 votes. Hácha was known as an undisguised reactionary, but he had never before participated in politics, and the electors hoped that he would have the innate respect of an international jurist for legal and constitutional forms. However, despite the conciliatory attitude of Hácha's government, the Nazis were not to be appeased and in March 1939 they instigated and supported the Slovak secession from Czechoslovakia. Hácha was summoned to Berlin, and after a four-hour conference with Hitler, during which Hácha was said to have fainted twice, he signed on March 15 a document which placed "the fate of the Czech people . . . trustingly in the hands of the Führer." Czechoslovakia's independence was thus brought to an end, Slovakia became a separate state, and Bohemia and Moravia a German protectorate. In recognition of his "co-operation," Dr. Hácha was named state president of the protectorate, but the real power rested in the hands of the *Reichsprotektor*. On March 21 Hácha dissolved Parliament and in its place appointed a Committee of National Co-ordination, composed of 50 men. When the Second World War was declared, he stated that Bohemia and Moravia would not participate in the conflict, but early in 1940 he expressed his hope for a German victory.

HADHRAUT. See ARABIA—*Aden* and *Aden Protectorate*.

HAITI. A republic occupying the western part of the island of the same name (also called Hispaniola, q.v.) in the Caribbean Sea. In the Carib language Haiti means "Mountain Land." It has an area of 10,204 square miles and a population of about 3,500,000, besides 3,000 foreign residents of the white race. Originally a French colony, Haiti proclaimed her independence on Jan. 1, 1804. From 1915 to 1936, by terms of a treaty with the United States, the president of Haiti was assisted by American advisers; their financial powers were transferred in September 1941 to the mixed council of administration of the National Bank which became the property of the Haitian state.

The constitution of 1935, amended in 1939, provides for the election of presidents for five-year terms by the National Assembly. The latter consists of 37 deputies elected for four years by popular vote and 21 senators appointed in part by the president and in part by the Chamber of Deputies.

President Elie Lescot, elected April 15, 1941, and assuming office on May 15 following for the term expiring May 15, 1946, received a new mandate in 1944 when the National Assembly amended the constitution to extend his term to 1951.

The capital in Port-au-Prince (population about 125,000). The other principal cities are Cap Haïtien (20,000), Aux Cayes (15,000), Gonaïves (20,000) and Port-de-Paix (5,000).

Religion and Education.—The predominant religion is the Roman Catholic. There are four bishops and an archbishop. The clergy are French

(principally Bretons); but for some years past a number of Haitians have entered the priesthood, tending to the establishment of a national clergy. Recently a number of American and Canadian religious orders have come into the country.

There are 1,065 urban and rural public and private schools with approximately 90,000 pupils. Eight national academies for boys, an academy for girls established in 1943, and 15 private institutions provide secondary instruction for about 7,000 pupils. There are 77 farm schools for boys and girls with an enrolment of 12,200 pupils, and 11 professional schools with 1,713 pupils. Pedagogical training is offered by two normal schools. Higher instruction is provided for about 350 students by the National School of Law, the School of Applied Science, the Faculties of Medicine, Pharmacy and Dentistry, and the Central School of Agriculture. There is also a military school for the training of officers. The formation of new technical and professional groups has been aided by numerous scholarship students sent for training in the United States.

Production.—Agriculture is the principal resource of the country, and its products constitute the majority of the exports. Coffee is the most important commodity with a median production of 31,800,000 kilograms per year. Next comes cotton, fig bananas, sugar, sisal, cocoa and rice. Since the outbreak of the Second World War strategic products, notably sisal and rubber (Hevea and Cryptostegia), have been considerably developed, and they contributed importantly to the continental defense. By agreement with the United States 24,000 additional acres were planted in sisal and 100,000 acres in Cryptostegia. There are 105,000 head of cattle, 650,000 donkeys, 400,000 horses, 31,000 goats, and 350,000 swine. The mountains are rich in precious woods and the forest wealth is exploited systematically for internal consumption. The mineral wealth, not exploited, consists of gold, silver, copper, tin, iron, coal and lignite, antimony, sulphur, manganese and gypsum. Recent surveys have been made with a view to the exploitation of oil and bauxite deposits.

Native Industry.—One of the most interesting recent developments has been the growth of the handicraft industry, reflected in a notable increase of exports of manufactured goods. Among the items contributing to this expansion are straw and sisal hand-bags, mahogany ware (exports of which doubled in the fiscal year 1944-45), cane and coconut straw braid, and straw and sisal shoes and slippers. The following table shows Haitian handicraft exports for the first ten months of the 1944-45 fiscal year compared with those for the corresponding period of the previous fiscal year:

	Oct. 1944— July 1945 value, gourdes	Oct. 1943— July 1944 value, gourdes
Mahogany ware	1,879,686	734,307
Straw hand-bags	245,948	239,591
Sisal hand-bags	1,531,495	1,155,787
Straw shoes and slippers	395,858	5,604
Sisal shoes and slippers	495,519	18,608
Cane and coconut straw braids	534,298	260,489
Total	5,132,804	2,414,386

Foreign Trade.—Since the beginning of the war Haitian commerce has been almost exclusively with the United States. During the 10-month period of October 1944 to July 1945 imports were valued at 55,696,272 gourdes (1 gourde = \$0.20 in U.S. currency), as compared

with the corresponding period of the preceding year when imports were 67,254,564 gourdes. In the same 1944-45 period exports amounted to 73,570,742 gourdes, as compared with the preceding year's 69,418,848 gourdes. The favorable trade balance for the 1944-45 period, of 17,874,470 gourdes, was due in part to a diminution of imports combined with higher prices obtained for exports. Another cause was the export item of 5,132,804 gourdes representing products of the light industries established since the beginning of the war. An additional factor was an increase in production of fig bananas and sisal.

During the same 10-month period (October 1944 to July 1945) 26,619,223 kilograms of coffee valued at 32,191,064 gourdes were exported, compared with 20,810,999 kilograms valued at 23,360,950 gourdes in the corresponding 1943-44 period. Fig bananas exported in the 10-month period ending July 31, 1945, amounted to 3,193,875 stems valued at 9,972,765 gourdes, an increase of 50 per cent in volume and 76 per cent in value over the corresponding previous period. This increase was the more remarkable since in July 1944 more than a million stems were destroyed on the limb by a storm in the Artibonite Valley, thus considerably reducing the harvest.

Haitian sugar is normally exported to Britain and the European continent. Exports for the ten months to July 31, 1945, amounting to 29,276,010 kilos, were less than half those for the corresponding previous period. Cotton exports also declined sharply, the export amounting to only 3,612,243 kilos valued at 2,043,129 gourdes, as compared with 9,053,783 kilos valued at 5,309,314 gourdes for the corresponding 1943-44 period.

Among other exported commodities, sisal deserves special mention. During the 10-month period to July 31, 1945, 7,101,086 kilos valued at 6,535,099 gourdes were shipped, as compared with 7,080,827 kilos valued at 6,524,922 gourdes exported in the analogous prior period. Of Haiti's total commerce during the first ten months of the fiscal year 1944-45, 82.81 per cent of imports were from the United States, while 76.63 per cent of exports went to the United States.

Finances.—Total receipts during the first ten months of the fiscal year to July 31, 1945, amounted to 36,567,000 gourdes, or 125,000 gourdes more than during the corresponding previous period. For the same period customs receipts amounted to 26,363,000 gourdes, which was 70,000 gourdes more than for the corresponding previous period. Total internal revenue for the period was 9,477,000 gourdes, which exceeded the amount received in the preceding corresponding period by 150,000 gourdes.

Expenditures from revenue for the 10-month period to July 31, 1945, amounted to 31,425,000 gourdes which was 775,000 gourdes above the expenditures for the corresponding prior period.

The public debt as of July 31, 1945, amounted to 56,936,000 gourdes, as compared with 64,961,000 gourdes on July 31, 1944, and 70,466,000 gourdes on July 31, 1943.

Communications.—There are 158 miles of railroads in the republic, all privately owned, 92 post offices, 1,500 miles of telegraph wire, and 46 commercial and 17 local exchanges with 1,200 miles of telephone wire. The vehicular roads have a total length of 1,300 miles and are steadily increasing. There are two wireless stations, one of which is official, and five radio broadcasting stations. The capital is connected by regular air service with Hinche, Cap Haïtien, Port-

de-Paix, Mole St. Nicolas, Gonaïves, Jacmel, Aux Cayes and Jérémie. Nine other airfields facilitate communications between the capital and other parts of the country, being available for special flights. Tourist travel seems destined for considerable development in a country with an incomparable climate and some of the finest scenery in the western hemisphere. In the northern part of the island is the famous citadel LaFerrière, built by King Christophe in 1806 and considered one of the wonders of the new world.

HALSEY, Edwin A., secretary of the United States Senate: b. Fern Moss, Tye River, Nelson County, Va., 1881?; d. Washington, D.C. Jan. 29, 1945. One of the most popular figures on Capitol Hill, Colonel Halsey was elected secretary of the Senate in 1933, after serving in various capacities as an employee of the Senate for nearly half a century. Colonel Halsey attended the Locust Dale (Va.) Academy and Virginia Polytechnic Institute. In 1897, he came to the Senate as a page boy for his uncle, Senator John W. Daniel of Virginia. He was employed in the press gallery for 16 years, and in 1910 was appointed colonel on the staff of Governor William H. Mann of Virginia. In 1928, he was elected sergeant-at-arms of the Democratic National Committee, and served in that capacity during the national conventions of 1928, 1932, 1936 and 1940.

HALSEY, William Frederick, Jr., United States naval officer: b. Elizabeth, N.J., Oct. 30, 1882. From the early days of the Pacific war, when he directed defensive operations against the Japanese as a task force commander, Admiral Halsey was one of the navy's most valuable combat officers. As commander of the United States Third Fleet, he played a prominent role in General MacArthur's recovery of the Philippines, co-ordinating his forces with those of Admiral Thomas C. Kinkaid's Seventh Fleet to support the initial invasion of the islands in October 1944. On October 22-27, his Third, with Kinkaid's Seventh routed the Japanese Imperial Navy in the Battle of Leyte Gulf, sinking or damaging over 60 enemy warships. On Jan. 10, 1945, his fleet lent naval and air cover to forces invading Luzon, largest island of the Philippine group.

In the summer of 1945, Admiral Halsey returned to his Third Fleet command, after a period of shore duty, and on June 3, sent carrier aircraft against airfields on the Japanese home island of Kyushu. Between July 14 and August 14, when Japan capitulated to the Allies, his Third Fleet and a supporting British task force ranged Japanese home waters at will—bombing and shelling shore installations, industrial areas, military bases, and airfields. On Wednesday, Aug. 29, 1945 (Tokyo time), Admiral Halsey entered Tokyo Bay aboard his flagship, the *Missouri*; on September 2 (Tokyo time), he witnessed the signing aboard the *Missouri* of the Japanese surrender document. On November 22, he relinquished his Third Fleet command to Admiral Howard F. Kingman. Admiral Halsey had previously requested retirement from the navy. On Nov. 28, 1945, President Truman nominated Admiral Halsey for promotion to admiral of the fleet, five-star rank.

Admiral Halsey is a United States Naval Academy graduate (1904) with a record of First World War service with a destroyer force, on patrol and convoy duty in enemy waters. He attended the Naval War College in 1932-33, and the Army War College, 1933-34. In December

1934, he qualified as a naval aviator, after flight training at Pensacola's Naval Air Station. Included among his military decorations are the Navy Cross, the Distinguished Service Medal, Gold Stars in lieu of a second and third Distinguished Service Medal, and the Army Distinguished Service Medal; in early June 1945, he was named an honorary knight commander of the Order of the British Empire.

HANGO or **HANKO**. A peninsula on the southern tip of Finland at the entrance to the Gulf of Finland. As a result of the Soviet-Finnish peace treaty of March 12, 1940, Finland leased to Soviet Russia the peninsula of Hangö with surrounding waters and islands for a period of 30 years at an annual rental of 8,000,000 Finnish marks, for the purpose of creating there a naval base capable of defending the entrance of the Gulf of Finland. Soviet land and air forces occupied the peninsula in 1940, but were forced to withdraw as a result of the second outbreak of war between Finland and the Soviet Union in 1941. In accordance with the terms concluding hostilities announced Sept. 19, 1944, Soviet Russia renounced her lease on the Hangö peninsula and obtained instead a 50-year lease to the Porkkala promontory up to within ten miles of Helsinki.

HANNegan, Robert Emmet, United States Cabinet official: b. St. Louis, Mo., 1903. On May 2, 1945, Mr. Hannegan was appointed postmaster general in the Truman Cabinet, succeeding Frank C. Walker. As Walker's successor as Democratic National chairman in 1944, Mr. Hannegan played a major role in the organization of the Democratic National Convention which led to Mr. Truman's nomination as candidate for the vice presidency. Born in St. Louis in 1903, the son of a police official, Mr. Hannegan tried to enlist in the marines in the First World War; was spotted by recruiters as under age; and sent back to school. He later studied law at St. Louis University and returned to coach athletics there. He began his political career in St. Louis, and in 1933, became a ward chairman. In 1934, he was named chairman of the City Democratic Committee. He became collector of internal revenue for eastern Missouri in 1942, and the next year, was appointed federal commissioner of internal revenue by the late President Roosevelt.

HARVARD REPORT ON GENERAL EDUCATION. See **EDUCATION**, **REVIEW OF**.

HAWAII. The Territory of Hawaii, an integral part of the United States, is a group of 20 islands, some 2,020 miles southwest of San Francisco. The group's eight principal islands, on which is concentrated its population of 467,325 (1944 est.), have a total area of 6,435 square miles. An analysis of the 1944 population figure reveals the following racial roots: Hawaiian, 2.5 per cent; part-Hawaiian, 11.9 per cent; Puerto Rican, 1.82 per cent; Caucasian, 32.63 per cent; Chinese, 6.09 per cent; Japanese, 33.5 per cent; Korean, 1.43 per cent; Filipino, 9.95 per cent; others, .18 per cent. On Oahu, most densely populated island of the group, is located the territory's largest city and capital, Honolulu, with a population (1944) of 245,590, exclusive of military personnel.

Despite the fact that hostilities between the United States and Japan began at Pearl Harbor, naval base 6 miles from Honolulu, the large Japanese population has been given a clean bill of health by military authorities and the Federal

Bureau of Investigation, and public statements have been issued to the effect that there were no evidences of sabotage in the area. The territory's Japanese were allowed to continue their normal pursuits. About 7,000 entered the armed services of the United States.

Government.—The governor, and the secretary of Hawaii whose duties are comparable to those of a lieutenant governor, are appointed for 4-year terms by the president of the United States, with the consent of the United States Senate. The governor in 1945 was the Hon. Ingram M. Stainback, who took office as Hawaii's ninth chief executive on Aug. 24, 1942. Other territorial officials (1945) were as follows: secretary, Gerald R. Corbett; treasurer, W. D. Ackerman; budget director, Paul J. Thurston; attorney general, C. Nils Tavares. The territorial legislature (Senate, 15 members; House of Representatives, 30) convenes biennially in odd years on the third Wednesday in February; its sessions are limited to 60 days. Members of the Senate are elected for four-year terms; those of the House for two-year terms. In the United States Congress, the territory is represented by a delegate, elected biennially to the House of Representatives; he has the right of argument in the House, but no vote. Judges of the territorial Supreme Court, Circuit Courts, and Federal District Courts are presidential appointees. Samuel B. Kemp was chief justice of the Supreme Court in 1945; associate justices, E. C. Peters and Louis LeBaron.

Hawaii is making a bid for statehood, and has shown by plebiscite that it is anxious for admission to the United States.

Education.—Public elementary school units in the territory (1944-45), 160; teachers, 1,886; pupils, 48,478; average yearly salary of elementary school teachers, \$2,522. Public junior high school units (1944-45), 29; teachers, 563; students, 15,722. Public senior high school units, (1944-45), 29; teachers, 654; students, 17,261; average yearly salary of junior and senior high school teachers, \$2,632. Education in the territory is compulsory for children between the ages of 6 and 15, inclusive. Teacher training courses are offered at the University of Hawaii, which at last report had 26 instructors and 269 students. Total territorial appropriation for the department of public instruction¹ and the University of Hawaii (1945-47), \$24,921,378; appropriation for education by cities and counties (1943-44), \$1,183,871. Superintendent of public instruction, Oren E. Long.

Territorial Institutions.—These, with their populations as of June 30, 1945, are as follows: Territorial Hospital, 1,075; Waimano Home, 535; Kawaihoa Training School for Girls, 185; Waialea Training School for Boys, 153; Oahu Prison, 483.

Religion.—Nearly all religions are represented in the territory, Christian predominating. Both the Anglican and the Roman Catholic churches have established dioceses in the islands. The Mormon Church has a tabernacle on Oahu.

Industry.—Hawaii's principal industry is the production of sugar, most of which is shipped to the mainland in a raw state. The sugar crop for 1943, the last year reported, was 885,640 tons. The second largest industry is the cultivation of pineapples; two thirds of the 1943 pineapple crop was set aside for the armed forces. Mo-

¹The Territory of Hawaii has a single state school system known as the department of public instruction. Operation, maintenance, and construction of lands and buildings are financed by the several (4) counties. All other educational expenses are financed by the territorial legislative appropriations.

lasses, hides, coffee, sisal, bananas, and wool are also exported. Shipments of merchandise from the United States to Hawaii in 1941 amounted to \$186,662,139; those from Hawaii to the United States, \$122,640,189, of which sugar, pineapples, and coffee were the principal items.

Finances.—The following statement¹ of territorial finances for the fiscal year 1944–45 was supplied by W. D. Ackerman, Jr., treasurer of the Territory of Hawaii:

Balance in treasury, beginning of fiscal year 1944–45.....	\$ 3,814,698.22 ²
Receipts, 1944–45.....	40,273,843.70 ³

Total	\$44,088,541.92
Disbursements, 1944–45.....	40,516,947.91 ⁴

Balance, beginning of fiscal year 1945–46	\$ 3,571,594.01 ⁵
---	------------------------------

¹ The above statistics represent General Fund only. Territory of Hawaii operates on fiscal year basis of July 1 to June 30.

² This amount does not include the sum of \$9,690,000 temporarily transferred to other funds, and also bond investments totaling \$4,500,840.

³ This amount includes the sum of \$5,447,300 retransferred from other funds.

⁴ This amount includes the sum of \$2,667,300 temporarily transferred to other funds, and also the sum of \$4,000,000 representing investment purchases.

⁵ This amount does not include the sum of \$7,210,000 temporarily transferred to other funds, and also bond investments totaling \$8,500,000.

Principal Events of 1945.—In late January 1945, Fleet Admiral Chester W. Nimitz, United States naval commander in the Pacific moved his headquarters from Pearl Harbor to Guam, several thousand miles nearer Japan. Resumption of cable communication between Honolulu and Guam was announced on February 25. Hawaii's 10 P.M. curfew, in effect since the Japanese attack at Pearl Harbor in 1941, was abandoned on July 7. On the Hawaiian labor front, some 20,000 sugar mill, factory, and agricultural employes were affected by the signing on August 8 of an agreement between the Hawaiian Sugar Planters Association and the CIO's International Longshoremen's and Warehousemen's Union, providing for a 7-cent hourly wage increase, vacations with pay, seniority rights, medical care, and the establishment of grievance machinery.

HAZARD, Caroline, American educator and author: b. Peace Dale, R.I., June 10, 1856; d. Santa Barbara, Calif., March 19, 1945. Internationally known as one of America's foremost women educators, Miss Hazard served as president of Wellesley College from 1899 to 1910, during which time the college doubled its enrollment and increased its material and financial resources. Educated by private tutors, Miss Hazard went to Europe at the age of 12 and studied art and music. She also attended Brown University, although at the time the institution did not grant degrees to women. However, she later received honorary degrees from Brown, the University of Michigan, Mills College, Tufts College, Wellesley, and Rhode Island State College. In 1926, she provided \$20,000 for the Two Brothers Fellowship at the Yale Divinity School for Biblical study in Jerusalem or other foreign places. In 1930 she gave to Wellesley the original love letters of Robert Browning and his wife, Elizabeth Barrett Browning. She was a corporate member of the American Board of Commissioners for Foreign Missions of the Congregational Church; an elector of the Hall of Fame, and honorary president of the Santa Barbara Museum of Natural History in California. Miss Hazard published more than 20 volumes, includ-

ing *Narragansett Ballads* (1894); *Some Ideals in the Education of Women* (1900); *From College Gates* (1925); and *Threads from the Distaff* (1934).

HEBRIDES, The, or WESTERN ISLANDS. An archipelago of about 500 large and small islands off the west coast of Scotland, extending from lat. 55° 35' N. to lat 58° 32' N. The group, with an area of about 2,812 square miles, consists politically of the Scottish shires of Ross and Cromarty, Inverness, and Argyll; and may be divided into the Outer Hebrides, of which the principal members are Lewis-with-Harris, North Uist, Benbecula, South Uist, and Barra; and the Inner Hebrides—Skye, Mull, Islay, Jura, Coll, Rum, Tiree, and Colonsay. Originally under the rule of the kings of Norway, they were annexed to the crown of Scotland in 1266. About 100 of the islands are inhabited, largely by Gaelic-speaking people; the total population was estimated (1940) at 205,000. The climate is mild and salubrious, but variable. Forest and fruit trees have been planted on some of the islands; oats, barley, and potatoes are the principal crops. Cattle, horses, and sheep are raised. The fisheries are not fully developed. Whisky is manufactured on Skye, Islay, and Mull.

HERRIOT, Edouard, French statesman: b. Troyes, Champagne, France, July 5, 1872. Eminent scholar, author, and educator, and three times premier of France, M. Herriot was revoked from his office of mayor of Lyon in June 1941 after the Germans overran France. He was more or less under house arrest in his estate of Brotel, not far from Lyon, and was held under residential surveillance in eastern France near Vittel, and later in Germany until August 1944. At that time, Laval had him brought back to Paris and asked him to use his authority to set up a new French government in Paris. After Herriot's refusal, he was taken again to Germany. On September 13, he was elected mayor in absentia of Lyon, his whereabouts at that time unknown. On April 30, 1945, he arrived in Moscow with his wife, having been liberated April 26 by units of the Red Army, and on May 19, was in Lyon, ready to assume his duties as mayor. M. Herriot was graduated with honors from the École Normale Supérieure in 1894, and thereafter, taught at the Lycée at Nantes, later at the Lycée at Lyon. In the years before the First World War, he became a popular lecturer, and an able newspaperman and propagandist. He played a prominent part in postwar international conferences. He held his first premierships, 1924–25, and was minister of public instruction, 1926–28. He was again premier, from June to December 1932; minister of state, 1934–36; and president of the Chamber of Deputies, 1936–40.

HERSHEY, Milton Snavely, American industrialist: b. Derry Township, Dauphin County, Pa., Sept. 13, 1857; d. Hershey, Pa., Oct. 13, 1945. Founder of the Hershey Chocolate Corporation, Mr. Hershey was a noted philanthropist who built up a model community for his factory workers and donated many millions for charitable

purposes. Mr. Hershey first sold candy in Philadelphia, but went out of business after his horse-drawn wagon was wrecked. Next he borrowed money and set himself up in caramel-making in New York and failed again. After a similar fate in Chicago, he went to Lancaster, Pa., in 1888 and in 1893 began manufacturing chocolate there. In 1903 he sold out for \$1,000,000, bought 1,200 acres near his birthplace, and set up a chocolate manufacturing center. Under his guidance, the one-industry town which bears his name grew into a model planned community, with four golf courses, a swimming pool, a sports arena seating 8,000, and a park of 1,000 acres. The Hershey property with successive expansions, now covers 12,000 acres, and the plant handles milk produced by 25,000 cows in dairies throughout central Pennsylvania. A corollary development was the construction of 267 miles of railroad in Cuba connecting two provinces, and the building of hotels and villages to care for the workers who operated his three sugar mills and the plantations which supplied them. Mr. Hershey developed a system for dealing with his employees which for a generation kept the plant free from industrial disputes. A quarter of the profits in business were distributed every three months in the form of dividends upon wages and salaries. During the depression, he set up a public works program in Hershey, built homes for the workers, a community house, resort hotel, high school, and other improvements. His model plant was disturbed in April 1937 by a sitdown strike staged by the CIO; but a federal regional labor board held an election, and the CIO union was rejected by a vote of 1,542 to 781.

In 1905 Mr. Hershey founded the Hershey Industrial School to house and provide academic, vocational, and commercial training for orphan boys, and in 1918 he set up a trust fund estimated at \$60,000,000 (which has since grown to more than \$80,000,000) for the maintenance of this school. In 1936 he formed the M. S. Hershey Foundation, with an endowment of 5,000 shares of Hershey common stock, then worth \$400,000, to establish and maintain one or more schools for the education of Derry Township boys and girls after they were graduated from high school. Two years later the Hershey Junior College was opened. After his 87th birthday, Mr. Hershey resigned the presidency of the Hershey Industrial School, the Hershey Corporation, and the Hershey Trust Company, but continued as chairman of the board of the Hershey Chocolate Corporation.

HEWITT, Henry Kent, United States naval officer: b. Hackensack, N.J., Feb. 11, 1887. On July 14, 1945, Admiral Hewitt succeeded retiring Admiral Harold R. Stark as commander of United States naval forces in European waters. In 1944, he directed Allied naval operations for the invasion of southern France (August 15); to this assignment he applied lessons learned from the invasion of North Africa in November 1942, in which he commanded American naval forces supporting the attack on Casablanca. He is also a veteran of naval action supporting the invasions of Sicily and the Italian mainland in 1943.

HIGHWAYS. Highway work during the year 1945 consisted of maintenance of the general network of highways and such highway con-

struction as was certified officially as necessary in the conduct of the war. General highway construction was suspended at the beginning of the war and while restrictions were removed soon after the end of hostilities, conditions did not permit a general resumption of construction operations immediately. However, war activities have required improvement of main highways for transport of war materials and construction of access roads to war establishments and sources of critical raw materials. This work passed its peak in 1944 but continued in substantial amounts in 1945. Nearly \$5,000,000 of federal road funds were expended in building roads in Washington, Tennessee and New Mexico in connection with production of atomic bombs.

Highway construction, as measured by employment on state and federal projects at the height of the construction season in June, July, and August, reached a new low level. Only an average of 25,648 men were regularly employed. This is less than half the employment in the preceding year and about one sixth that in the same months of 1941. The big drop in employment from 1944 is due to the completion of highways to serve war activities.

The average number of men employed on state supervised highway maintenance in the summer months was 96,410, about the same number as in 1944 and 70 per cent of the number in the same period of 1941. Highways generally have not been maintained at prewar standards but the most essential repairs have been made. The maintenance burden has been materially increased by almost complete abandonment of the normal reconstruction and replacement program, thus making it necessary to keep in service many old road surfaces scheduled for replacement.

Use of highways during the war, under controls that very largely eliminated nonessential traffic, is an excellent indication of the importance of highways during the emergency. Under gasoline rationing and tire shortage there was very little recreational traveling. Manufacture of automobiles for civilian uses was stopped but new trucks were available for the more essential uses.

The need for highway transport in war industries, daily travel of war workers, food production and distribution and other essential uses was such that about 16½ billion gallons of gasoline would have been required in 1945 had the war continued. It now appears that about 19 billion gallons of gasoline will be used on the highways in 1945, or about 20 per cent less than consumption in 1941. The increase of 11.5 per cent over the 16½ billion used in 1944 is due largely to the ending of gasoline rationing on August 15.

Motor Vehicle Registration.—Registration of motor vehicles has held up remarkably well in view of lack of new automobiles and tires to replace those that wear out. It is estimated that 25,137,000 automobiles will be registered in 1945, 4,387,000 less than in 1941, but only 1.3 per cent fewer than the 25,466,000 registered in 1944. The small decline in 1945 indicates that many old vehicles, that would be junked in normal times, are somehow being kept in service.

Truck registrations in 1945 are estimated at 4,629,000, an increase of 2.6 per cent over 1944, and only 230,000 less than in 1941.

Travel by vehicles on all rural highways in 1945 is estimated at 122 billion miles. Nearly one fourth of this travel was by trucks. Transport of goods and commodities over rural highways is estimated at 57 billion ton-miles, an amount very close to that in 1940.

Federal Highway Activity.—During the fiscal year ended June 30, 1945, 4,011 miles of highway of all classes were completed as compared with 5,695 miles in 1944; 8,445 in 1943; 10,178 in 1942; and 12,936 in 1941. Almost all of the work was done with state co-operation. Highways completed consisted of 3,302 miles of access roads, 462 miles of the strategic network, and 247 miles of miscellaneous construction of war significance.

Twenty-one railroad grade crossings were eliminated, two obsolete structures were reconstructed and 54 crossings were protected by signals or other devices.

The total cost of all completed work was \$111,062,750 of which \$89,425,842 or 80 per cent was paid by the federal government. The cost of completed work was approximately half of that completed in the preceding year although the mileage completed declined only about one third. This was due to the recent building of a greater proportion of low-cost access roads to timber and mineral resources.

Approval of new projects fell to a new low level of 2,730 miles as compared with 11,270 miles in fiscal year 1941.

No additional funds for immediate use were made available during the year. Construction was financed largely with remaining portions of \$290,000,000 of access road funds authorized by the Defense Highway Act of 1941 and its amendment of April 4, 1944. Funds for improvement of the strategic network of highways provided by the same legislation and small amounts of regular federal-aid funds were also used.

The Postwar Program.—Reorientation and broadening of the highway program in the light of modern traffic conditions was an active subject in prewar years. In 1939 the report *Toll Roads and Free Roads*, prepared by the Public Roads Administration after detailed study of highway conditions, recommended federal assistance in making three classes of improvements: (1) Construction of a system of interregional highways with appropriate connections through and around cities; (2) continued improvement of the federal-aid system, and (3) improvement of a system of secondary or feeder roads.

The beginning of the war removed all prospect of immediate action on these recommendations, but, as highway work was stopped and normal replacement of worn-out surfaces was not made, the need for a large postwar program was accentuated. Data on highway conditions and use in prewar years had already established the need for major improvements and the great use made of highway transport during the war added weight to the facts already presented.

A large postwar highway program offered advantages beyond the transportation field by providing employment and stimulating business activity in the postwar readjustment period and would aid the national economy in the years beyond the readjustment period. As the industry of the country was wholly converted to war, the importance of preparing a program, ready for launching at the end of the war, was generally recognized.

Further indication of the form the program should take was given in the report of the National Interregional Highway Committee submitted to Congress by the President on Jan. 5, 1944. This report recommended the designation and improvement to high standards of a national system of rural and urban highways totaling approximately 34,000 miles and interconnecting the

principal cities of the several geographic regions of the country.

Legislation giving effect to the recommendations of the two reports was introduced in Congress and committees held hearings, principally in March, April and May of 1944. The Federal-Aid Highway Act of 1944 was approved on Dec. 20, 1944.

This legislation authorized an appropriation of \$500,000,000 to aid the states in highway improvement in each of the first three postwar fiscal years. For each year there was authorized \$225,000,000 for the Federal-aid Highway System, \$150,000,000 for expenditure on a system of principal secondary or feeder roads, and \$125,000,000 for sections of the Federal-aid System in urban areas. Conforming in effect to the recommendation of the Interregional Highway Committee, the act required the designation of a National System of Interstate Highways not exceeding 40,000 miles in extent, by joint action of the state highway departments and the Public Roads Administration and provided that the new system, when designated, would become automatically part of the Federal-aid Highway System, and so eligible for improvement with the two funds provided for the latter system. No funds were earmarked for the Interstate System only. It also required a system of principal secondary or farm-to-market roads to be selected by the state highway departments in co-operation with county officials and the Commissioner of Public Roads.

Funds for the first postwar fiscal year were apportioned on Jan. 6, 1945. Rules and regulations to govern administration of the act were approved and issued on April 6, 1945. With these steps taken the general pattern of the postwar program was established. With the ending of the war emergency actual construction could legally begin. However, much remained to be done, both in designating highway systems and in detailed planning of projects. Congress by joint resolution on Oct. 2, 1945, authorized the beginning of construction operations but it was evident that a large program could not be launched before winter arrived.

Planning the National System of Interstate Highways.—In February each state highway department was requested to proceed at once with recommendation of routes for inclusion in the National System of Interstate Highways as required by the Federal-Aid Highway Act of 1944. Attention of the states was directed to the system of highways outlined and recommended in the report *Interregional Highways*. It was made clear that in calling attention to this system the Public Roads Administration intended in no way to limit the freedom of action of the states in selecting routes for tentative designation.

Under the provisions of the law it is necessary that each state highway department consider not only the internal needs of the state but also that it act jointly with highway departments of adjoining states to select a connected system.

Maps showing recommended routes accompanied by traffic data and other information supporting the recommendations have been submitted by nearly all of the states. In general the tentative state recommendations coincide very closely with the system recommended by the National Interregional Highway Committee. A different routing is proposed for some sections and a number of additional routes across states are proposed. In a number of instances these proposed routes are not met at the state line by a proposed

route in the adjoining state. Total mileage recommended for inclusion in the system considerably exceeds the legal limitation of 40,000 miles.

The proposed routes are now (October 1945) being studied in detail by the Public Roads Administration. Probable service to population, industry and the national defense by the routes proposed and by possible alternates is being carefully analyzed. A tentative integration of the routes proposed by the states, to follow from this review, will be referred to the state highway departments for their further consideration severally, and, if necessary in regional groups, leading to eventual agreement on the national system as a whole.

As conceived, the National Interstate Highway System will connect our larger cities and industrial areas with broad, modern highways over which traffic will flow freely. It will pass directly through the cities on express routes. There must also be provision of circumferential and distribution routes within and around the larger cities. The mileage of these circumferential routes may aggregate several thousand miles and this must be taken into account in selecting the system.

Planning Secondary Systems.—The Federal-Aid Highway Act of 1944 authorizes \$150,000,000 for improvement of secondary or feeder roads in each of the first three postwar fiscal years. This is the first authorization of funds in an amount large enough to permit a major federal program of secondary road improvement under conditions that will lead eventually to the creation of a co-ordinated system.

The funds are to be available for expenditure only on principal secondary and feeder roads and on a system of such roads selected by the state highway departments in co-operation with county supervisors, county commissioners, or other appropriate local road officials and the Commissioner of Public Roads. A statement of policy and procedure in designating systems was issued in May. The object of the legislation was stated to be the initiation of a more comprehensive rural road program through the selection and improvement of a system of principal secondary or feeder roads, supplementing the Federal-aid Highway System in rural areas, so that together the two systems will form an integrated network of trunk-line and feeder roads.

No specific limit is to be placed on the mileage of secondary road systems. However, the states were urged to include only such mileage as can be adequately improved within a reasonable period of years and maintained with revenues that may be expected to accrue.

One of the primary purposes of the state highway planning surveys of prewar years was the scientific planning of local roads to give adequate service at a cost within the range of financial resources. Data on traffic volume, condition of road improvement, population distribution, and location of schools, churches and business places have already been used in planning a lesser program of federal-aid secondary roads. This information is now being used in completing work already well advanced in many states and begun in others.

Highways in National Forests and National Parks.—Construction of highways in federal forest and park areas was almost entirely suspended during the war. A few roads of particular importance in reaching mineral deposits and timber needed for war purposes were improved. Generally the work was only that required for logging and ore hauling operations. However, considerable work was

done on surveys, soil investigations, preparation of plans and specifications, and the development and approval of programs of projects for the enlarged postwar program authorized in the Federal-Aid Highway Act of 1944. This act provides \$25,000,000 forest highway funds, \$4,250,000 for national park highways, and \$10,000,000 for parkways, for each of the first three postwar fiscal years.

The Department of Agriculture appropriation bill for the fiscal year ending June 30, 1946, provides an appropriation of \$1,500,000 of forest highway funds for maintenance and reconstruction. Regulations to govern the expenditure of these funds were prepared and issued after approval by appropriate officials. Plans and specifications are now prepared for projects that will absorb all park and forest highway funds and those for parkways for the first postwar fiscal year. Construction will begin in the spring of 1946.

The Inter-American Highway.—Work on the 3,300-mile highway from the Texas border to Panama continued during the year but only at a moderate pace. At the end of the year 2,487 miles had a surface suitable for automobile travel at all seasons of the year and 280 miles was passable in dry weather. Impassable gaps in Mexico, Honduras, Costa Rica and Panama totaled 567 miles. The gap in Honduras is only eight miles and a bypass is in use.

Planning of this highway is an international undertaking but each country through which it passes is in full control of financing and constructing sections within its borders. All work in Mexico has been done without outside assistance. Sections in other countries have been financed by the government of the country and often engineering assistance has been given by the United States. The United States has aided in financing some of the projects and currently assistance is being given from a fund of \$20,000,000 authorized by the act of Dec. 26, 1941. Assistance from this country is limited to two thirds of the cost.

An all-weather road exists from the United States border to about 50 miles south of Oaxaca, Mexico, a distance of 1,140 miles. From Oaxaca south, Mexico has pushed the improvement as fast as wartime conditions would allow.

R. E. ROYALL,
Public Roads Administration.

HIMMLER, Heinrich, Nazi government official: b. Munich, Germany, Nov. 7, 1900; committed suicide, Lüneburg, Germany, May 23, 1945. Creator and chief of one of the world's greatest police systems, the German Geheim Staats Polizei or Gestapo; minister of the interior; and ultimately head of the entire administrative organization inside Germany, Heinrich Himmler had the distinction of being the embodiment of Nazi terror and violence as instruments of national and international policy.

Born of Bavarian parents in Munich, he was too young for First World War combat service. He joined Hitler's Nationalist Socialist German Workers' Party in 1919; was in 1923 considered too unimportant a party member to be punished after the abortive putsch which put Hitler behind bars. It was Himmler's genius for organization which attracted Hitler's attention in the early days of the Nazi movement. Even then, he kept an exhaustive card-index file of persons within and without the Nazi fold, and over a period of some 20 years, this file grew to enormous proportions and contained dossiers of every

person of importance throughout Europe. In the years of German preparation for the Second World War, these records formed the basis for the numerous blood purges which rid the Nazis of all effective opposition inside Germany, and later when Nazi armies were on the march in Europe, they singled out for elimination those who constituted a threat to German victory.

Himmler became chief of the Schutzstaffel Corps—the SS—in 1929, and in 1933, at Hitler's order, formed the Gestapo. Within a very short time, these organizations became the mainstay of the Nazi regime—the Gestapo ferreting out the opposition; the SS making arrests, conducting "trials," and executing the victims.

In 1936, Himmler was appointed police commissioner and director of law and order for the entire Reich. He had by that time done away with hundreds of thousands of Germany's "internal enemies," and with the invasion of Austria two years later, did the same for that country. The pattern was repeated for Czechoslovakia, Poland, Norway, France, Russia—espionage, execution of whole populations by any of a number of despicable methods, deportation to Germany of subjugated people for forced labor battalions, concentration camps for military and political enemies.

Himmler reached the height of his power in 1944, after the attempt on Hitler's life on July 20. From the wholesale reorganization of army and civil administration that followed, he emerged chief of the home front and commander of the Wehrmacht inside Germany, and second only to Hitler in authority over the German people. This marked his final victory over other high Nazi officials, who had for years jockeyed for position inside Hitler's inner circle.

After German capitulation, Himmler was the object of an intensive manhunt in the British Second Army area, and on May 21, 1945, was apprehended northeast of Bremen. On the evening of May 23, he chose to commit suicide by poison rather than face the probability of death before a firing squad.

HIROHITO, *hē rô-hē'tō*, emperor of Japan: b. April 29, 1901, son of Emperor Yoshihito. In 1921, as crown prince, he made a tour of Europe. The same year his father retired from office by reason of ill health, and the government of the empire devolved on Hirohito as prince regent. On Jan. 26, 1924, he married Princess Nagako Kuni by whom he had seven children, two sons and five daughters born between 1925 and 1939. The eldest son, heir apparent to the imperial throne, is Prince Akihito Tsuguno Miya (b. 1933). On the death of the Emperor Yoshihito, Dec. 25, 1926, Hirohito succeeded to the throne; but for the previous five years he had in effect been the sovereign. The rescript which Hirohito issued on this occasion stressed his desire for domestic harmony and peace with other nations. Officially the new reign was designated the period of Showa, meaning Light and Peace. Yet this noble aspiration flatly contradicts the imperial policy initiated only five years after Hirohito's accession when in 1931 Japan invaded Manchuria, thereby starting a war with China, and a decade later made unprovoked attacks on territories of the United States, Great Britain, France and the Netherlands, and also compelled Siam to become a vassal state.

Since the overthrow of the shogunate in 1867, ending the feudal system, and the restoration of the imperial power by Emperor Meiji Tenno, the

ancient Shinto doctrines that the emperor is the descendant in unbroken succession of the Sun Goddess, and is therefore himself divine, drawing his authority from divine ancestors, have been accepted as the state religion. In fact, the emperor bears the title *Dai Nippon Tekoku Tenno* (Imperial Son of Heaven of Great Japan). Japan may therefore be considered a true theocracy, the emperor being more than a high priest and even more than a symbol in the usual sense of the term: he is a god in his own right, like the Inca monarchs to the ancient Peruvians. To what extent Hirohito with his divine prerogatives, but with the disadvantages of being so far above the mundane sphere as to appear more a symbol of the state than an initiator and activator of policy, could influence his government is a debatable question. Although he was supreme commander of the armed forces whose chiefs had direct access to him and were accountable only to him, not to the Cabinet or Diet, it seems to have been the feudal-minded military men with a group of avaricious industrialists who made the political and military decisions that involved Japan in a global war that culminated in August 1945 with her catastrophic defeat and the loss of her overseas empire. Hirohito seems to have been no more than a symbol used by these men to achieve their ends.

HISPANIOLA or SANTO DOMINGO. An island in the West Indies, divided politically into the Republic of Haiti (western part) and Dominican Republic (eastern part). See **DOMINICAN REPUBLIC**; **HAITI**.

HISTORICAL ASSOCIATION, American. See **AMERICAN HISTORICAL ASSOCIATION**.

HITLER, Adolf, German dictator: b. Braunau on the Inn River in Upper Austria, April 20, 1889; reported to have died in Berlin May 1, 1945. Adolf Hitler was the fifth of his father Alois Hitler's seven children and the third child of Alois Hitler's third wife. Alois Hitler was born in 1837 in Strones, Lower Austria, the illegitimate son of Maria Anna Schicklgruber. He changed his name to Hitler—reputedly his father's name—in 1876. After Alois Hitler's retirement as a minor customs official, the family settled at Leonding, near Linz, provincial capital of Upper Austria. At the elementary school, Adolf Hitler's teacher complained of his lack of concentration on his work. At the age of 12, Adolf failed in the secondary school. He never went beyond the fourth of the seven grades.

When Adolf was in his 13th year his father died. After the boy had idled for a year, his mother finally succeeded in having him apprenticed to a paper hanger at Urfahr (twin city of Linz). After six months, having failed to learn the trade, Adolf came home to live on his mother's meager pension. A year before Hitler's mother died, in 1908, she sent Adolf to Vienna, where he expected to be admitted to the capital's world-famous Academy of Arts. The name of Adolf Hitler appears on the qualification list of the academy for 1907 and 1908. The first verdict reads, "Test drawing below standard"; the second, "Not admitted to the test." Much of Hitler's paranoia traces to this failure. His resentment was translated into a bitter and enduring hatred of Vienna, the Austro-Hungarian monarchy, and its people.

After another brief interlude in Linz—at his mother's expense—Hitler again tried his luck in Vienna as a bricklayer's helper. Unsuccessful in

this and in all other trades he attempted, Hitler's interest turned to politics. His most admired model was the Pan-German member of the Reichsrat, Georg Schönerer, an all-out advocate of German world domination, who hated the Roman Catholic Church and the Jews.

At the outbreak of the First World War, Hitler was supposed to present himself to the Austrian consulate for induction. By failing to do so, he became a deserter from the Austrian Army. He escaped prosecution by voluntarily serving in the allied German Army. A regimental orderly, he never rose above the rank of *Gefreiter* (private first class) in his Bavarian infantry regiment.

After the end of the First World War, Hitler was afraid of losing shelter, food, uniform, and pay. Until April 1920, he idled in army barracks at Traunstein, Bavaria. When the post was broken up, he went to Munich, still on the army payroll. By that time, a cleverly disguised section of the German General Staff, later to become the "psychological laboratory" of the Wehrmacht, was infiltrating political groups to educate civilians in militarism. Capt. Ernst Röhm directed lectures and discussions in the Munich barracks, designed to train the men as demagogues or secret observers. In one of these discussions, Hitler shouted down a soldier who argued against anti-Semitism. Captain Röhm was so pleased that Hitler was appointed "education officer"—without a military promotion.

The army used to send "education officers" to party meetings disguised as interested civilian listeners. Hitler was assigned to report on a German Workers' Party, which met in a beer cellar, and signed up as member number 7. This party later changed its name to National Socialist German Workers' Party (Nationalsozialistische Deutsche Arbeiterpartei). After delivering some speeches, Hitler was appointed the party's propaganda chief.

Hitler argued that Germany had not lost the war, but had been stabbed in the back by Jews, Communists, and Socialists. Other nations, with the temporary exception of Britain, were inferior and should be conquered. Claiming to be threatened by Communists, Hitler asked for a personal bodyguard, so the SA (Sturmabteilung) was organized and commanded by Captain Röhm. This organization was later followed by the SS (Schutzstaffel). These groups spread terror, but the authorities were tolerant.

In 1923, the National Socialist Party was a factor to be reckoned with in southern Germany and Hitler was already its leader. The head of the Bavarian state, Generalkommissar Gustav von Kahr, together with General von Lossow and Police Col. Hans von Seisser, plotted to overthrow the republic.

On Nov. 8, 1923, a meeting was called in the Munich Bürgerbräuhaus. Hitler brought his guard, including Captain Göring. Kahr, Seisser, Lossow, and Ludendorff also were present. Hitler proclaimed the outbreak of the "national revolution." General von Seeckt, head of the German Army (Reichswehr), although not averse to the putsch, objected to the timing. Kahr, Lossow, and Seisser, warned by von Seeckt, withdrew from the putsch without telling Hitler. After a night of debates and confusion, a group of 2,000 National Socialists, including Ludendorff and Hitler, marched through Munich in a bid for power. Seisser, meanwhile, had mobilized his police. After the demonstrators refused to disband, the police shot 14 National Socialists. At

the first shot, Hitler flung himself to the ground and later fled.

Hitler, Ludendorff, and eight others were charged with high treason. The "people's court" acquitted Ludendorff and sentenced Hitler to the minimum penalty of five years' fortress detention. He was released before the end of 1924. In the fortress of Landsberg on the Lech, Hitler was treated as a distinguished guest. Among the party members who shared his confinement was Rudolf Hess, to whom Hitler dictated his book *Mein Kampf*.

Geheimrat Alfred Hugenberg, member of the board of Krupp and administrator of Pan-German political funds, decided to line up his Conservative Nationalists with Hitler's followers. Well-equipped with funds, provided by Hugenberg, the National Socialist Party went full blast into the election campaign for the German Reichstag in September 1930. It won 6,500,000 votes and 107 seats, thus becoming the second largest party in Germany. With Hugenberg's money available, Hitler turned away from the little people who had almost ruined themselves to support his party and decided to be "respectable."

A presidential election was held in March 1932. President Paul von Hindenburg, running for another term, was opposed by Hitler, who only recently had become a German citizen. Hindenburg won, but Hitler received 13,000,000 votes. In August 1932, Reichstag elections gave his party 13,700,000 votes and 230 seats, making it the strongest in Parliament. The wire-puller of German politics, Gen. Kurt von Schleicher, had Hitler summoned twice to see the president.

Appointed chancellor after von Papen's failure, Schleicher, who disliked Hitler and possessed secret files of his record, tried to develop a Socialist-militarist combination. The general strongly resented the fraudulent distribution of government funds to indebted landowners. One of the estates thus illegally financed belonged to Hindenburg. Schleicher was ready to release reports on the scandal. Junker landowners and their officer-relatives uniting against him, Schleicher had to resign, and Hitler, untroubled by frauds, was appointed chancellor Jan. 31, 1933. Hitler dissolved the German Parliament, in which his party finally had 43 per cent of the seats, and established a one-party rule with the German Army as sole partner.

Hitler's first attempt at conquest was dictated partly by revenge. In July 1934, long before German armaments were completed, Hitler personally inspired a National Socialist putsch in Austria. He was responsible for the murder of Chancellor Engelbert Dollfuss and the ensuing bloodshed. The plan to annex Austria was postponed after Italy threatened to intervene. Thereafter it became Hitler's aim to make Mussolini his vassal.

When the German General Staff decided in June 1934 that Hitler's Storm Troopers should be reduced to obedience to the army, Hitler did not hesitate to carry out a "blood-purge" and personally shot Captain Röhm. The army, in return, did not object to the killing of General Schleicher.

After President von Hindenburg's death in August 1934, Hitler (with the army's consent) was proclaimed leader, or *führer*, of the Reich with unlimited powers. When the non-German countries meekly accepted the introduction of compulsory military service in Germany, the remilitarization of the Rhineland, and the annexa-

tion of Austria in March 1938, Hitler came to feel that his will was law everywhere and that his Third Reich would really last for a thousand years. He even believed that his conquests might be achieved without active resistance, by blackmailing victim countries into acquiescence. British Prime Minister Chamberlain's visit to Berchtesgaden (September 1938) to prepare the surrender of Czechoslovakia was construed by Hitler as striking evidence of international submissiveness. The negotiations with Russia, which led to the German-Russian nonaggression pact of August 23, 1939, were carried out on the German General Staff's initiative rather than the führer's. Even after declaration of war, Hitler believed his enemies would surrender without serious fighting.

Military operations against Poland in 1939 and against Norway, Denmark, France, and the Low Countries in 1940 were carried out according to the plans of the German General Staff with Hitler as a figurehead. But after Great Britain failed to surrender, bewilderment spread among the German generals and Hitler was urged to let his intuition decide on future courses of action. His orders became oracles to the general staff. Hitler's intuition brought about the fatal Russian campaign and the alliance with Japan which led to war with the United States.

On July 20, 1944, an attempt against Hitler's life was reported. If the story is true, it seems incredible that he could have escaped without serious injury. Either the reports were incorrect or a double attended the conference and was killed, while Hitler boastfully claimed to have been protected by Providence.

Superstitious faith in a last-minute miracle to ward off disaster animated Hitler during the crucial months of 1945. His ultimate fate is veiled in mystery. A German communiqué reported his death in action in the Reich's Chancellery in Berlin on May 1 at 3:30 P.M. Later versions told of suicide, perhaps in company with Eva Braun, whom he was said to have married at the last minute. The Russians found several corpses that might have been Hitler's, but no positive identification was made.

HODGES, Courtney H., United States Army officer: b. Perry, Ga., Jan. 5, 1887. General Hodges commanded the United States First Army in the Allied invasion of France and the subsequent drive into Germany (1944-45). He became chief of the First Army in August 1944, succeeding Gen. Omar N. Bradley whom he had served for a time as deputy commander.

Life magazine says of the First Army and its commander, in an editorial *Salute to the Armies* (April 9, 1945), "The American First Army lives up to its name . . . It was the first to land in France, the first to take Paris, the first to enter Germany. Its divisions were handpicked by General Bradley, who turned it over in top form to Lieut. Gen. Courtney Hodges.

"It was the First Army which took Cherbourg. Later it was the First which engineered the break-through at St. Lô and opened a hole for the Third. It was the First . . . that painfully cleared out the Hürtgen Forest. And it was one division attached to the First, the 101st Airborne, which clung to Bastogne with fantastic bravery . . . during the December Battle of the Bulge. For holding out until relieved by counterattacks . . . the 101st was given a presidential citation.

" . . . it was the First which was in the van of the American armies. It had seized the Ludendorff Bridge (March 7) at Remagen, thus forcing the first crossing of the Rhine. From there its spearheads raced north, outflanking the entire Ruhr valley."

On April 19, 1945, General Hodges' troops took Leipzig, fifth largest city in the Reich, and on April 25, effected a junction with Marshal Konev's First Ukrainian Army at Torgau on the Elbe River, merging the Allied western with the Russian eastern front in Europe.

On May 22, 14 days after the German surrender, announcement was made of the redeployment of General Hodges and his First Army to the Pacific theater, by way of the United States.

One of the few non-West Pointers in the Americans high command, General Hodges served in Mexico with Pershing's Punitive Expedition (1916) and in France in the First World War as an infantry officer. Between the two wars, he taught at West Point; was a member of the Infantry Board (1929-33); and a general staff member of the Philippine Department. From October 1940-May 1941, he was commandant of the Infantry School at Fort Benning, Georgia. In February 1943, he succeeded Lieut. Gen. Walter Krueger in the Third Army command, and was promoted lieutenant general. He was attached to General Bradley's staff when Allied pre-invasion plans were in the making. General Hodges is a graduate of the Field Artillery School (1920), the Command and General Staff School (1925), and the Army War College (1934). On April 17, 1945, he was recommended by President Truman for promotion to the rank of full general (temporary).

HOFFMAN, Gustave Adolph, American artist: b. Cottbus, Brandenburg, Germany, Jan. 28, 1869; d. Rockville, Conn., Aug. 30, 1945. A noted artist and etcher for over 50 years, Mr. Hoffman has work represented in the National Gallery in Berlin, the Royal Gallery in Munich, the National Gallery in Leipzig, the British Museum in London, and many American collections. One of his notable contributions was the development of a process for producing etchings in all colors in one impression.

HOLLAND. See **NETHERLANDS, THE.**

HOLSTI, Eino Rudolf Woldemar, Finnish diplomat: b. 1881; d. Palo Alto, Calif., Aug. 3, 1945. Finnish minister of foreign affairs from 1919 to 1922 and again from October 1936 to November 1938. Dr. Holsti had been acting professor of political science at Stanford University since 1941. He received his M.A. degree in 1908 and his doctorate five years later from the University of Helsinki. He served twice in the Finnish Diet (1913-18; 1922-23) and for eight years lectured on sociology at the University of Helsinki. As minister of foreign affairs, he secured recognition of Finland's independence at the Paris Peace Conference in 1919, and saved his country from starvation by a successful appeal to Herbert Hoover, then United States food administrator. He served as minister to Great Britain (1918-19); envoy extraordinary and minister plenipotentiary to Estonia and Latvia (1923-27); and as permanent delegate to the League of Nations and minister to Switzerland (1927-36; 1938-40). Before he resigned as minister of foreign affairs in 1938, it was reported that there had been grave friction between him and the German government because of his anti-Nazi views. In 1939, as Finnish

delegate to the League, he fiercely arraigned Russia's action in the Baltic and obtained her expulsion from that body. Nazi domination of Finnish affairs forced him into exile in 1940.

HOMMA, Masaharu, Japanese Army officer who commanded Japanese forces in the Philippines in the early days of the Pacific war. When he surrendered for Allied questioning in Tokyo on Sept. 15, 1945, he declared that the American defense of Corregidor was so strong, he had about admitted Japanese failure when the Americans raised the white flag over the island fortress on May 6, 1942; he added that the battle for Bataan had taken much longer than he had expected. General Homma denied he had ordered the infamous Bataan death march in which American and Filipino prisoners were unmercifully beaten and stragglers killed by their Japanese guards. Homma was replaced in the Philippines by Lieut. Gen. Shigenori Kuroda in the spring of 1943, and was ordered home and retired. In the First World War, Homma was an observer with the British in France; later held military posts in India and in London; and in 1939, commanded Japanese forces, at Tientsin, China. Prior to Pearl Harbor, he commanded the Japanese Fourteenth Army on Formosa, then training for the Philippine invasion. At the close of the year Homma was on trial in the Philippines as a war criminal.

HONDURAS. A Central American republic noted for banana, silver, and gold production, Honduras has an area of 46,322 square miles, and a population (preliminary census figures of June 24, 1945) of 1,600,000. Tegucigalpa, the capital (urban population June 24, 1945 census, 55,715), is the administrative hub for 17 departments, 273 municipalities and districts. The most mountainous and heavily mineralized Central American country, Honduras is rich in hard woods, medicinal plants, and excellent agricultural and grazing land. *Mestizos* (Spanish and Indian cross) make up 86.4 per cent of the population. Indians constitute 9.54 per cent, and 4.06 per cent are whites, Negroes, and Orientals in that order.

Government and Politics.—Under the 1936 Constitution now in effect, Honduras has a president, a vice president, single-house legislature of 45 members elected directly for 6 years, and a Supreme Court of 5 appointed by Congress. President Tiburcio Carias Andino, elected in 1932 by a great popular majority, was continued in power by Article 202 of the 1936 Constitution until Jan. 1, 1943, and by vote of Congress on Dec. 18, 1939, until Jan. 1, 1949. Internally, the country was at peace during 1945. Opposition parties, hoping to take advantage of wartime discomforts to foment disorders, lost support as economic conditions improved. Externally, Honduras gave some consideration to a new plan for Central American Union but took no action.

Education.—Some 52 per cent of the inhabitants above 7 years are illiterate, but free, public secular education between the years 7 and 17 is compulsory, and there are 1,062 primary schools, 18 secondary schools, the National University and various private institutions in operation. Slightly more than 10 per cent of the national budget is for education.

Agriculture and Mining.—Both agriculture and mining recovered significantly in 1945 from wartime difficulties. In the first quarter, Honduras exported 3,032,798 stems of bananas, an increase of 38 per cent over shipments in the last quarter of 1944 and a 29 per cent increase over those during the first quarter of 1944. As of March 31, 1945, the area planted to bananas totaled 41,961 acres, a slight increase as compared with the 41,457 acres on Dec. 31, 1944. Wine production, begun in 1944, yielded between 40,000 and 50,000 bottles (one-fifth gallon). On the other hand, drought decreased the amount of abaca stalk available for processing. The industry was begun on Jan. 3, 1942, when the United Fruit Company contracted with the Defense Supplies Corporation to plant from 7,000 to 30,000 acres of abaca and to supply fiber to the government. By the beginning of 1945 one plantation was producing fiber at an estimated rate of a million pounds a week. Shipping shortages preventing lumber imports from the United States encouraged exportation of Honduran lumber to neighboring countries. Exports of pine logs amounted to 644,444 board feet from July 1, 1944, to March 31, 1945. Rubber production in 1945 fell below that of 1944, and exports of clean and washed coffee in the first quarter of 1945 amounted to only 3,340 bags of 60 kilograms each (1 kilogram is 2.2046 pounds) as compared with 6,392 bags in the first 3 months of 1944. On June 30, 1945, the Food Supply Program of the Institute of Inter-American Affairs in Honduras was terminated. The work of the institute, however, was immediately taken over by the Honduran government agency, the National Nutrition and Agriculture Commission.

Although Honduran industries are far less important than agriculture and mining, 1945 saw satisfactory progress in their development. The *Compañía Azucarera Hondureña* of San Pedro Sula, the only sugar mill in the country, completed milling season for 1945 late in June, producing 1,300 short tons of sugar (about one-tenth of the annual consumption of the country). Honduras' only cigarette factory—the *Tabacalera Hondureña* of San Pedro Sula—produced 10 per cent more than had been considered maximum. The *Fábrica de Mantequilla y Jabón Atlántida* of La Ceiba continued to experiment with native oil-bearing nuts and seeds for producing soap and shortening.

Transportation.—More than 13 per cent of the budget is spent on new road construction or repairs, and there are now more than 1,000 miles of roads. Important transportation developments in 1945, however, were in airlines. On March 8, 1945, Congress approved the application of *Servicio Aéreo de Honduras, S.A.* for a domestic airline contract. SAHSA's initial capital was subscribed by the government, Honduran citizens, and a private airline, which will lend technical and administrative personnel in getting the company started. TACA (*Transportes Aéreos Centroamericanos*) on July 16 added three more towns (Comayagua, La Paz, and Marcala) to its network of domestic airline services. Honduras now has regular airline service to 22 towns, serving about 30 per cent of the population.

Finance.—With favorable business conditions throughout the country, the budget collections for 1945 were greater than either 1943 or 1944 and the Honduran supply of dollars was steadily increasing.

WILLIAM S. STOKES,
Instructor in Political Science, Northwestern University.

HONDURAS, British. See **BRITISH HONDURAS.**

HONEY. A prospective 1945 honey crop of 225,779,000 pounds, based on September 15 indications, was reported for the United States by the Department of Agriculture. This was an increase of 20 per cent over the 1944 production and 16 per cent above the 5-year (1939-43) average production. The leading producing states with the amount in pounds credited to each in 1945 were: Iowa, 7,689,000; Wisconsin, 6,080,000; Minnesota, 5,386,000.

HONG KONG. A British colony off the south-east coast of China, consisting of several islands and a small part of the mainland at the mouth of the Canton River. The island of Hong Kong, about 11 miles long and 2 to 5 miles broad, has an area of 32 square miles; it is separated from the mainland by the Lyemun Pass, about half a mile in width. First occupied by Great Britain in 1841, it was formally ceded in 1842. Kowloon Peninsula, about 3 square miles in area, which faces the island, is also British-owned, having been ceded in 1860. The New Territories, in the southern part of the Kwangtung Province of China, together with the island of Lan-tau and Mires Bay and Deep Bay, were leased to Great Britain in 1898 for 99 years. The total area of the colony is 391 square miles. It was administered by a governor, assisted by an Executive Council of 9 members and a Legislative Council of 17 members, nominated nonofficials including Chinese representatives. The population in 1941 was 1,639,337, the majority being Chinese. Education was not compulsory, but schools were held to certain standards of efficiency and inspected by the state. There were 1,273 schools subject to government supervision with 116,280 pupils, including 4 government schools for children of British parentage and 13 government schools for Chinese boys and 2 for Chinese girls. There was 1 school for Indians. The University of Hong Kong, which was opened in 1912, had faculties of medicine, engineering, science, and arts.

From having been a barren island, within 100 years Hong Kong grew to be an important center of international trade. Besides Great Britain and China, other countries trading largely with the colony were the United States, French Indo-China, Germany, the Netherlands East Indies and Siam. For the first nine months of 1941, the imports were valued at HK\$270,779,000 and the exports at HK\$511,093,000. Except for taxes on alcoholic liquors, tobacco and petroleum, Hong Kong was a free port. Revenue was derived from port and harbor dues, house assessment and estate and stamp duties.

The Peak, residential section of Victoria, the capital, is connected with lower levels by a cable tramway. A railway through Kowloon and the New Territories, 22 miles in length, connects the colony with Canton. There were 384 miles of roads in 1940, and before the Japanese invasion Hong Kong was served by British, American, and French air services, and by Chinese-owned lines into China.

Japanese land, air, and naval forces attacked Hong Kong on Dec. 7, 1941. British, Canadian, and Indian troops were forced to retreat from the mainland December 14. After an 11-day siege, on Dec. 25, 1941, the colony fell to Japan because the water supply had failed. A total of 18,000 British, Australian, and Canadian troops were captured by the Japanese. Later, in January 1942, about 700,000 civilian prisoners were evacuated, some to the old Stanley Prison.

Japanese installations at Hong Kong were raided by Allied carrier aircraft during 1942-43, and after American occupation of the Philippines they were repeatedly attacked by land-based bombers. With capitulation of Japan it was rumored that the Chinese proposed to occupy Hong Kong. On August 23, when Prime Minister Attlee stated in the House of Commons that a British commander would accept Japanese surrender of the colony, Winston Churchill recalled "that on numerous occasions, and particularly at the Cairo Conference [with Chiang Kai-shek] in 1943, the government have made it plain that they do not contemplate modification in the sovereignty of His Majesty's territories in the Far East." A British naval force entered the port of Hong Kong on August 30, and the colony was formally surrendered to Rear Admiral Cecil H. J. Harcourt by the Japanese army and navy commanders on Sept. 16, 1945. Tales of Japanese barbarity to their captives in Hong Kong paralleled those elsewhere. The Japanese also confiscated almost the whole of the £90,000 sent there each month by the British Red Cross to aid prisoners and internees; out of one monthly advance the Red Cross representative received £80,000—all other moneys, month after month, went into Japanese pockets.

HONJO, Baron Shigeru, Japanese Army officer: b. 1876?; committed suicide, Tokyo, Nov. 20, 1945. Former commander of the Japanese Kwantung Army, Baron Honjo had been held responsible for the Mukden incident in 1931. He had served as adviser to the New Asia Movement of the Imperial Rule Assistance Association, a militarist propaganda clique, and was termed by Allied headquarters "one of the ringleaders of the Japanese war lords." He was also president of the newly organized Society for the Relief of Demobilized Soldiers. Baron Honjo committed harakiri shortly after his arrest had been ordered as a war criminal suspect.

HOPKINS, Harry L., American government official: b. Sioux City, Iowa, Aug. 17, 1890; d. New York, N.Y., Jan. 29, 1946. On July 3, 1945, Mr. Hopkins retired from government service for reasons of health, submitting his resignation as adviser and special assistant to President Truman. He had served the late President Franklin D. Roosevelt in a similar capacity from March 1941 until the latter's death in April 1945.

Mr. Hopkins was a welfare worker in New York City before he entered the federal government under Mr. Roosevelt in 1933, as the first administrator of emergency relief. From 1935-38, he headed the Works Progress Administration, and supervised the spending of billions of dollars to make work for the nation's unemployed. He was then appointed secretary of commerce, a post he was forced to relinquish in August 1940 because of poor health. The next year, he was named co-ordinator of lend-lease, a position he held for only a few months. He was appointed a member of the advisory committee of the Office of War Mobilization in May 1943.

Long-time confidant of the late President Roosevelt, to whom he was intensely devoted, Mr. Hopkins accompanied that chief executive to the Atlantic Charter meeting with Prime Minister Winston Churchill. He also took part in the Roosevelt-Churchill meetings at Casablanca and Cairo and the Big Three conferences at Teheran and Yalta.

In late January 1945, Mr. Hopkins conferred with Gen. Charles de Gaulle in Paris on the

European situation; went on to Rome for a brief talk with Pope Pius. He entered Mayo Clinic in February for treatment of a recurrent nutritional ailment. By late May 1945, however, he was sufficiently recovered to go to Moscow on a mission for President Truman. His conversations with Marshal Stalin during his Moscow visit are said to have broken the deadlock on procedural issues at the San Francisco Conference and paved the way for solution of the Polish question. This marked his second mission to Moscow, his first having been made in July 1941, shortly after the German attack on Russia. A few days after he resigned his government post, Mr. Hopkins accepted a position in private industry. In September, he was awarded the Distinguished Service Medal for the performance of "services of outstanding value to the United States from December 1941 to July 1945."

HOPS. Three states, Washington, Oregon and California, produce the commercial hop crop of the United States. In 1945 these states yielded a total of 55,810,000 pounds, compared with 47,695,000 pounds in 1944 and a 1934-43 average crop of 39,240,000 pounds. In 1945, Washington produced 21,060,000 pounds; Oregon, 19,900,000 pounds, and California, 14,850,000 pounds. Oregon led in production in 1944 and in the average production in 1934-43 with 17,112,000 pounds and 18,069,000 pounds respectively.

HORSE RACING. See SPORTS IN 1945.

HORTHY, Nicholas de Nagybanja: b. Kenderes, Hungary, 1868. Former regent of Hungary and virtual dictator from March 1920 until the Germans established a government of their own in Hungary in March 1944, Admiral Horthy was taken into protective custody by troops of the American Seventh Army at Weilheim, Bavaria, on May 1, 1945. According to a Paris dispatch, Horthy was not made a prisoner of war as he did not hold a field command at the time of his capture. During his regime, Hungary signed the Anti-Comintern Pact, and in November 1940, the three-power agreement with Germany, Italy, and Japan. On Dec. 13, 1941, his country declared war on the United States and Great Britain. In the First World War, Admiral Horthy commanded units of the Austro-Hungarian Fleet. He was elected governor regent of Hungary after the short-lived Communist revolution under Béla Kun.

HOUSING. In October 1945, wartime restrictions on new residential construction were removed. After nearly four years, controls were lifted on the size, type, price range, and quantity of new housing. In addition, priorities were no longer necessary for obtaining construction materials.

To minimize the danger of inflation inherent in an uncontrolled building boom, the federal government instituted a program of strict controls over the prices of building components, government advisory service to prospective homebuyers, and joint industry-government co-operation to combat inflated building costs and real estate prices. Some government officials, including Price Administrator Chester Bowles, believed that this program did not go far enough toward

curbing inflation, and urged that, in addition, definite ceilings be placed on the rents and sales prices of completed new homes.

Although many observers had predicted that a building boom of unprecedented size would result from the lifting of construction controls, no accurate statement could be made with respect to the rate and volume of construction that could be expected. Shortages in many essential building materials were one of the factors holding up immediate resumption of building activity; however, it was expected that there would be adequate supplies of all such materials by the first of the new year.

Estimates of the probable postwar housing need have ranged from 300,000 to 2,000,000 new dwellings per year for the first 10 postwar years. It is generally agreed that at least 1,000,000 to 1,250,000 houses must be built annually during this period, if basic housing requirements are to be met. The general housing need was everywhere reflected in critical housing shortages, which added to the problems of returning veterans and complicated the question of clearing urban slums and blighted areas.

Housing Legislation.—The most important legislative development of the year was the comprehensive housing bill introduced by Senators Wagner and Ellender on August 1. At the time of its introduction Senator Taft submitted to the Senate Committee on Postwar Economic Policy and Planning the report of its Subcommittee on Housing and Urban Redevelopment, of which he is chairman. The bill and the report conformed in most respects.

The Wagner-Ellender Bill outlines general housing policy under a section titled "American Housing Objectives." These objectives cover the volume of investment and employment in housing enterprise; the need to increase the total housing supply to eliminate current deficiency and provide for national growth with special emphasis upon the needs of returning veterans and their families; the encouragement of home ownership; replacement of slums and other substandard areas; systematic improvement of residential neighborhoods as the core of better city planning and redevelopment of American communities; conservation of the existing housing supply.

Under separate titles the bill describes the governmental machinery required to perform research and local market analysis, urban redevelopment, middle-income housing ("yield insurance" plan under FHA), low-rent public housing (four-year program to provide approximately 500,000 units), rural housing, disposition of federally-owned permanent war housing, and to make permanent the wartime consolidation of federal housing agencies now assembled under the National Housing Agency.

The Wagner-Ellender Bill and the report of the Subcommittee on Postwar Housing and Urban Redevelopment agree that the objective of a national housing policy is to provide adequate housing for the entire people; that this is primarily the responsibility of private enterprise, which should be assisted to do the job; but that direct public action is necessary to serve that part of the housing market in which private enterprise cannot operate at a profit.

Influential congressional committee reports issued during the year included a report of the House Committee on Postwar Economic Policy and Planning, on July 5, by Chairman Colmer, entitled "Postwar Public Works and Construc-

tion." It emphasized the position of the construction industry in the national economy and favored continued federal aid to public housing.

By the end of the year, there were 40 states with legislation authorizing the creation of local housing authorities to construct and operate low-rent housing in co-operation with the federal government. Nevada in 1945 became the fortieth state. In this year also, Alaska passed enabling legislation permitting its cities to participate in the federally-aided low-rent housing program.

In preparation for postwar building expansion, several states amended their housing enabling legislation to facilitate financing operations and to broaden the scope of local programs to include rural housing. New York State expanded its state-aided low-rent housing activities and in Illinois and Pennsylvania, new legislation indicated that state-aided low-rent housing programs might be initiated.

Urban Redevelopment.—In 1945, ten additional states adopted urban redevelopment legislation, extending the power of eminent domain to the assembly of sites for slum clearance and private redevelopment. Twenty states in all now have such legislation: Alabama, Arkansas, California, Colorado, Connecticut, Florida, Illinois, Indiana, Kansas, Kentucky, Maryland, Massachusetts, Michigan, Minnesota, Missouri, New Jersey, New York, Tennessee, Pennsylvania, Wisconsin.

In some states, private redevelopment corporations operate directly under local legislative bodies or the state housing board. In others, specially-created local public redevelopment agencies supervise the corporations and assemble the land. Still other laws permit local housing authorities to acquire land for private redevelopment.

The problem of writing down the high cost of blighted urban land is not fully provided for in urban redevelopment legislation thus far adopted. However, looking toward the time when federal loans and grants may be made available to local agencies for this purpose, most of the recent legislation permits local redevelopment agencies to accept such aid. Also, five states provide a subsidy for redevelopment corporations in the form of tax freeing in varying degrees.

Introduction of several urban redevelopment bills for the District of Columbia renewed the controversy over the pros and cons of public housing, both in and out of Congress. Special Congressional committees had, since 1943, been considering District of Columbia urban redevelopment and housing legislation. Early in the year, the National Industrial Conference Board, in an analysis of hearings conducted in 1944 by one such committee, declared that private builders could build low-rent housing at costs lower than those achieved by government. The report was widely circulated, refuted, and defended; and although the debates that followed applied only to Washington, they were generally considered a preview of the kinds of questions that might come up elsewhere in the country.

New York was the only city that had concrete plans for urban redevelopment ready for construction at the end of the war. The site for the Metropolitan Life Insurance Company's Stuyvesant Town had already been acquired and the Metropolitan and a number of savings banks had announced plans for other large-scale redevelopment projects. However, other cities as well were preparing to implement their redevelopment legislation, namely: Chicago, Philadelphia, Baltimore, St. Louis, Kansas City (Missouri), Detroit, Memphis, and Minneapolis.

Other Outstanding Events and Trends.—In the planning, design and construction of housing there has been continued perfection of mass production techniques, improvement in the quality and use of new building materials; interest in prefabrication and mass marketing; large scale planning of complete neighborhood units. Many war-stimulated industrialists and companies contemplate entering the low-cost housing fields, among them Henry Kaiser and Beech Aircraft.

Labor took an increased interest in housing and the legislative proposals affecting policy. The CIO created a Housing and Community Development Department to co-ordinate its interests in the field. A special activity of the CIO has been to promote the mutual home ownership plan (a co-operative approach).

One of the many problems facing the federal government is the disposition of thousands of temporary war-built units in the best interests of the nation and the affected localities. The necessity for meeting the needs of servicemen's and veterans' families was only partially and temporarily solved by an amendment to the Lanham Act which permitted occupancy of temporary war housing by families in a "distressed" state by reason of "eviction, low income, or otherwise." This made apparent the necessity for improving the housing provisions in the GI Bill of Rights.

Public and private housing leaders, threatened with inflated housing sales costs, vigorously sought devices which would "hold the line" on costs, but not restrict construction volume. Raymond Foley, the new FHA Commissioner appointed in July, was particularly concerned with this problem as it related to an expanded FHA program to assist private building. President Truman focused attention on housing in his 21-point reconversion program. War Mobilization Director John W. Snyder appointed Hugh Potter, prominent Texas private developer, to the position of construction co-ordinator, in an attempt to expedite an extensive postwar housing program. Secretary of Commerce Henry Wallace announced the creation of a Construction Division in the Bureau of Foreign and Domestic Commerce.

The Committee on Hygiene of Housing of the American Public Health Association, as a result of a four-year effort, announced a new appraisal technique to measure quality and quantity of housing. This technique is expected to be an improvement over former methods and to add substantially to our knowledge of the existing housing inventory. See also ARCHITECTURE.

Associate Director, National Association of Housing Officials.

HUMAN NUTRITION. See AGRICULTURAL RESEARCH ADMINISTRATION.

HUNGARY. A country in central Europe, east of Austria and west of Rumania. The area, as fixed by the Treaty of Trianon in 1920, was 35,875 square miles. With the assistance of Hitlerian Germany, Hungary subsequently took from Czechoslovakia, Ruthenia (q.v.) and part of Slovakia (1938-39); from Rumania, northern Transylvania (1940); and from Yugoslavia, the Banat (1941). These accessions of territory increased the area of Hungary to 61,891 square miles, but all of them were lost with the defeat of Germany and her satellites in 1945. The population in 1938 prior to the first transfer of Czechoslovakian territory totaled 8,991,179; with frontiers temporarily enlarged, Hungary's inhabitants were esti-

mated in 1942 to number 13,644,000. The capital is Budapest (pop. 1943, 1,216,726).

Government.—Becoming an independent state after the First World War, Hungary chose the status of a monarchy but left the throne unfilled. On March 1, 1920, Admiral Nicholas Horthy de Nagybanya was elected regent, and he continued to exercise the royal prerogatives until October 16, 1944, when he resigned under pressure from the Nazis. The bicameral legislature enacted in 1937 release of the regent from responsibility to it; and in 1943, by direction of the regent, Parliament was adjourned sine die. When hostilities ceased in 1945, the country was being administered by a provisional government under the auspices of the Soviet Union.

The budget for the calendar year 1944, as announced by the finance minister, showed estimated revenue of 5,866,700,000 pengös, against expenditure of 6,147,000,000 pengös; service of the public debt required 263,000,000 pengös in 1943. One pengö equalled \$0.1977 in U.S. money in 1941, but it dropped disastrously in 1945, by October 13 being 20,000 to the U.S. dollar. Between Nov. 30, 1944, and Sept. 30, 1945, the Hungarian note circulation grew from 10,670,000,000 to 41,920,000,000, and as inflation increased the printing presses were turning out 1,000,000,000 pengös each day.

Education.—Primary education is free and compulsory for all children from 6 to 12 years of age in day schools, and thereafter for three years in continuation schools. Prior to the Second World War, elementary schools in Hungary numbered 8,103, with 1,104,916 pupils and 23,215 teachers. There were also numerous agricultural and vocational schools, and 263 middle schools with 79,435 pupils. The state also maintained universities at Budapest, Pécs, and Debrecen; the József Nádor Technical and Economic University was a consolidation of certain high schools giving instruction in those fields. Theological seminaries numbered 29 (24 Roman Catholics, 1 Greek Catholic, 3 Protestant, and 1 Jewish). Jewish enrollment in the higher schools and universities was restricted to 5 per cent of the total number of students.

Religion.—About two thirds of the Magyars are Roman Catholics, and the remainder mostly Calvinist. At the 1930 census the Roman Catholics numbered 5,634,003; Helvetic Evangelicals, 1,813,162; Augsburg Evangelicals, 534,165; Greek Catholics, 201,093; Greek Orientals, 39,839; Unitarians, 6,266; and Jews, 444,567. Moderate anti-Jewish laws were adopted in 1938, and rigid anti-Semitic measures were effected in 1940; violent persecution of the Jews commenced in 1944.

Production.—Agriculture is the basis of Hungarian life, some areas being among the most fertile in the world. About 51.8 per cent of the entire population of Hungary were engaged in agricultural work prior to the war, as compared with 30.1 per cent in industrial and commercial activities. Arable land occupied 60.2 per cent of the total area; meadowland and rough pasture, 17.9 per cent; and forests, 11.8 per cent. Next to Russia, Hungary was the biggest wheat exporter in Europe. Excluding annexed areas, the 1938-39 production (in quintals) of wheat was 30,781,736; corn, 23,345,394; potatoes, 22,930,404; sugarbeet, 11,605,255; rye, 8,637,385; barley, 7,895,528; and oats, 3,659,137 quintals.

Hungary's bauxite deposits are of prime importance (output of 500,193 tons in 1939). Other minerals include coal, lignite, and iron. Petroleum

production in 1939 (January-June) was 41,850 tons. Iron and steel are made, and other industries include wheat milling, sugar refining, and distilling. The Tokay wines of Hungary have a high reputation in Europe. Exports of all products in 1943 had a value of 1,288,800,000 pengös, and imports amounted to 1,147,200,000 pengös; Germany was Hungary's best customer, Italy ranking second and Great Britain third.

Transportation and Communication.—The length of railways in Hungary proper was 6,307 miles in 1938-39. The greater part was operated by the state. Railway lines in northern Transylvania increased the Hungarian network by some 1,460 miles. The telegraphs and telephones are owned by the government. There were 3,625 miles of state roads, 14,743 miles of municipal roads, and 5,273 miles of lesser roads, or a total of 23,641 miles of highways.

PRINCIPAL EVENTS

On Oct. 15, 1944, Admiral Nicholas Horthy, regent of the country, asked the Allies to grant Hungary an armistice. But three hours later a new pro-German government under Ferenc Szálasi, leader of the Fascist Arrow Cross organization, had taken over in Budapest. A reign of terror swept the capital and bloody clashes were staged throughout the country. Horthy, his family, and close associates, were, the German press reported, "enjoying the right of asylum" somewhere in the Reich. By early November 1944, Russian troops were within a few miles of panic-stricken Budapest, in a four-pronged offensive; on November 11, Col. Gen. János Vörös, chief of the Hungarian Army General Staff, crossed over to the side of the Red Army and urged his country in the name of Horthy to refuse to defend Budapest. The Provisional National Assembly, consisting of delegates elected in liberated territory between December 13-20, met at Debrecen on December 21, to form a government. Prof. Béla Zsedenyi was elected president of the assembly and Gen. Béla Miklós, premier. On December 29 war was declared on Germany, the premier promising that all resources would be mobilized against Germany; anti-Jewish laws were abolished, land reforms were to be introduced, and private enterprise safeguarded as the basis of economic life. The principal terms of the armistice signed in Moscow on Jan. 20, 1945, between the provisional Hungarian government and the Soviet Union, the United Kingdom, and the United States, on behalf of the United Nations, were: (1) Hungary undertook to disarm German armed forces and to make available such land, sea, and air forces as might be specified for service under the Allied (Soviet) High Command. (2) All Hungarian troops were to be evacuated from the territory of Czechoslovakia, Yugoslavia, and Rumania. (3) Hungary undertook to return all valuables and materials removed from United Nations territory and to make good losses caused to the Soviet Union, Czechoslovakia, and Yugoslavia by military operations. (4) The Vienna Arbitration Award of Nov. 2, 1938, and the Vienna Award of Aug. 30, 1940, were declared null and void. (5) And lastly, Hungary agreed to pay \$300,000,000 reparations in six years. Following a 50-day siege, the Red Army completed the conquest of Budapest on Feb. 13, 1945. In the middle of May the government returned to Budapest. Under the land reform, passed on March 17, all estates of over 1,000 katastraljoch (one katastraljoch is about 1.42 acres) were to be seized and others reduced to 100 joch per owner; but

the Roman Catholic Church and its institutions were to be allowed to retain 100 joch each. Imré Nagy, minister of agriculture, and Gábor, minister of public welfare, represented the Communists in the government, while the conservative circles gathered around Count Teleki, minister of education. Other parties in the new Hungary were: the Social Democratic Party; two agrarian parties (the smallholders and a newly formed party of hitherto landless peasants called the National Peasants Party); and two middle class parties (Liberal and Republican). It was reported in September that Soviet troops were preparing to evacuate Hungary.

What are said to have been the first "wholly free" national and municipal elections ever held in Hungary took place Nov. 5, 1945, and resulted in a decisive majority for the conservative Small Landholders Party as against the Socialists and Communists. The result had been forecast on

October 7, when the Small Landholders scored a decisive victory over the combined Socialist-Communist ticket in the Budapest municipal elections. Early returns gave the Small Landholders 58 per cent of the more than 4,000,000 votes cast in the November 5 elections; the Social Democrats about 22 per cent, and the Communists about 14 per cent. Among the prominent individuals elected to Parliament were Count Michael Károlyi, former premier; Zoltán Kodály, composer; Gen. Béla Miklos, retiring premier; and Albert von Szent-Gyorgyi, Nobel Prize winner for his work on vitamins. The new Parliament will number approximately 300 members, since every 12,000 votes elects one deputy.

JOSEPH S. ROUCEK,
Professor of Political Science and Sociology, Hofstra College.

HYGIENE. See PUBLIC HEALTH SERVICE, U.S.

ICELAND. Geographically, an island in the North Atlantic Ocean; politically, an independent republic. Located on the southern border of the Arctic Circle, 600 miles northwest of Great Britain, its area is 39,709 square miles, and its population on Dec. 31, 1943, was 125,915. The Althing (Parliament) proclaimed Iceland an independent republic on June 17, 1944, and the same day elected for a one-year term, Sveinn Björnsson, the country's first president. The capital is Reykjavik (pop. 42,815). Other large towns are Akureyri (5,842), Hafnarfjörður (3,944), and Vestmannaeyja (3,524).

Government.—Under the president, executive power is vested in a Cabinet of six ministers headed by a prime minister. The Althing (Parliament) of 52 members is divided into an upper house and a lower house. The former is composed of one third of the members elected by the entire Althing in common sitting. The remaining two thirds of the members form the lower house. The Althing must meet on February 15 each year. Budget bills must be laid by the government before the two houses in joint session; all other bills can be introduced in either house. Ministers have free access to both houses but can vote only in the house of which they are members. Olafur Thors, leader of the Independent Party, became prime minister Oct. 22, 1944.

Education and Religion.—Elementary education is free and compulsory from the age of 7 to 14; there are 238 primary schools, with 8,709 pupils. Besides continuation schools for those going to work at the age of 14, there are several day high schools, 2 schools of agriculture and a school of navigation. The University of Iceland is located at Reykjavik.

The majority of the people are members of the Evangelical Lutheran Church, which is supported by the state. There is religious freedom, no civil disabilities being attached to those of other faiths.

Finances.—The budget estimates for the year 1945 called for revenue of 108,177,878 kronur and an expenditure of 100,211,675 kronur. The public debt on Dec. 31, 1943, amounted to 65,746,000 kronur, of which 13,185,000 kronur was

on behalf of banking and mortgage institutions; the foreign debt was 31,123,000 kronur, and the internal debt amounted to 34,623,000 kronur.

Production.—According to the census of 1930 36.5 per cent of the population of Iceland lives on agriculture; 22.4 per cent work in the fishing industry; 15.1 per cent work in industries; and 16.2 per cent in commerce and navigation. The fisheries are principally for cod and herring, but sole, flounder, haddock and halibut also are of importance. In 1942, 335,157 metric tons of fish were caught. Stock raising is of importance; in 1943 there were 618,000 sheep, 62,000 horses, 40,000 cattle, and 1,700 goats. Hay is the principal crop; from both cultivated and uncultivated land, in 1943 the hay crop amounted to 3,928,000 hundredweight. In the same year, 110,000 hundredweight of potatoes and 7,000 hundredweight of turnips were raised. The principal industries are the curing and salting of fish, the rendering of fish and animal oils, and canning. Woolen cloth and blankets are manufactured, as well as shoes and gloves; miscellaneous manufactures include oilskins, steel barrels, fishing lines and nets. Mineral resources are few and lack exploitation; a low grade of coal is extracted on a small scale. Boiling water from groups of geysers is brought to Reykjavik in concrete pipes and used to heat buildings and horticultural nurseries. Iceland's waterpower has been estimated at 4,000,000 horsepower, but only about 25,000 horsepower has been harnessed.

Foreign Trade.—Besides fish and fish products, Iceland exports mutton, wool, sheepskins, furs and eiderdowns; among the chief imports are automobiles, machinery, coal, metal products, food stuffs, textiles and clothing, wines and spirits, footwear, and petroleum products. During the Second World War most of Iceland's markets on the continent of Europe were closed, the bulk of the trade being with Great Britain and to a lesser extent with the United States. In 1943 exports were valued at 233,246,000 kronur, and imports at 251,301,000 kronur.

Communications.—There were some 2,700 miles of highways before the war. The country had 4,106 registered automobiles in 1944, about

half of them trucks. Telegraph and telephone lines have a length of some 10,000 miles, and external telecommunications are by cable and wireless. The merchant marine in 1943 consisted of 443 vessels with a combined tonnage of 39,315 gross tons.

Principal Events.—The kingdom of Iceland, an independent and sovereign state, concluded with Denmark on Dec. 1, 1918, a 25-year Treaty of Union providing for a joint monarch for the two countries. However, on April 10, 1940, the day after the occupation of Denmark by Germany, which event had prevented the king from exercising his authority, the Althing vested in the Cabinet the royal functions of Christian X in Iceland. On May 17, 1941, the Althing gave notice that the Treaty of Union would not be renewed upon its expiry in 1943, and provided that meanwhile supreme power in Iceland was to be entrusted to a regent, elected annually.

British troops were landed in Iceland on May 10, 1940, to forestall seizure of the island by the Germans; they were followed by United States forces on July 7, 1941; and the last of the British garrison was withdrawn from the country by Nov. 15, 1942.

By a referendum during May 20–23, 1944, at which 98 per cent of the electorate voted, the people overwhelmingly favored severance of ties with Denmark and establishment of a republic. In accordance with this decision, on June 17, the Althing formally abrogated the Treaty of Union and unanimously passed a bill declaring the country a republic. Sveinn Björnsson, who had been serving as regent since the office was established in 1941, was elected by the Althing the same day as first president of the republic of Iceland.

President Björnsson visited the United States in August in company with Vilhjalmur Thor, Iceland's foreign minister. At a press conference the Icelanders declared in answer to questions asked by journalists regarding retention of the bases established by the United States on Iceland that no such proposals had been made to them. Foreign Minister Thor remarked that "we did not establish our republic in order to become less independent. We intend to own our country, all of it, and without any foreign interference. . . We regret any implications claiming the necessity for the United States to acquire peacetime military bases in Iceland."

The government which had been formed by Prime Minister Björn Thordarson in 1942, resigned on Sept. 16, 1944, after the Althing had refused to accept the Cabinet's proposals for control of inflation. The following month a new government was formed by Olafur Thors, leader of the Independent Party, who in addition to assuming the premiership, became minister for foreign affairs in place of Vilhjalmur Thor.

IDAHO. Mountain state, United States; admitted to the Union July 3, 1890. Population (1940): rural, 348,165; urban, 176,708; total, 524,873. Land area, 82,808 square miles, divided into 44 counties. Chief cities, with 1940 populations: Boise City, the capital, 26,130; Pocatello, 18,133; Idaho Falls, 15,024; Nampa, 12,149; Twin Falls, 11,851.

Chief State Officers, 1945.—Governor, Charles C. Gossett; lieutenant governor, Arnold Williams; secretary of state, Ira Masters; treasurer, Ruth Moon; auditor, Ernest Hanson; attorney general, Frank Langley.

Judiciary.—Chief justice of Idaho's Supreme

Court, James F. Ailshie; associate justices, Edwin Holden, Alfred Budge, Raymond L. Givens, Bert H. Miller.

Legislature.—The state legislature (Senate, 44 members; House of Representatives, 59) convenes biennially in odd years on the first Monday after the first day of January.

Education.—Public elementary schools (1943–44, latest school year reported), 1,012; teachers, 2,615; pupils, 76,696; average yearly salary of elementary school teachers, \$1,171. Public junior high schools, 20; teachers, 192; students, 8,911. Public senior high schools, 172; teachers, 1,062; students, 25,724; average yearly salary of junior and senior high school teachers, \$1,612. Education in Idaho is compulsory for all children between the ages of 8 and 18, inclusive. There are 3 teacher training schools which together with the University of Idaho's Southern Branch at Pocatello receive financial aid from the state. Total state appropriation for education (1943–44), \$1,830,000; appropriation by cities and counties, \$2,742,756.24.

Finances.—Following is a statement of Idaho's finances for the fiscal year 1944–45, furnished by the state treasurer's office:

Balance in treasury, beginning of fiscal year 1944–45.....	\$20,329,816.22
Receipts, 1944–45.....	38,547,775.05
Total	\$58,877,591.27
Disbursements, 1944–45.....	45,275,644.42
Balance, beginning of fiscal year 1945–46	\$13,601,946.85

Agriculture.—The yield of the leading crops of the state in 1944, with 1934–43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934–43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.).....	1,823	1,581	1,421
Oats (1,000 bu.).....	6,239	7,308	6,764
Wheat (1,000 bu.).....	24,779	30,309	32,340
Barley (1,000 bu.).....	7,580	12,728	12,384
Rye (1,000 bu.).....	93	96	112
Sugar beets (1,000 short tons)	789	618	837
Peas, dry field (1,000 bags)	1,117	2,672	1,652
Hay:			
Alfalfa (1,000 tons).....	1,874	1,814	1,855
Clover and timothy (1,000 tons).....	168	195	191
Tame (1,000 tons).....	2,184	2,148	2,191
Wild (1,000 tons).....	134	145	162
Beans, dry edible (1,000 bags)	1,731	2,088	1,643
Potatoes (1,000 bu.)....	28,910	36,675	43,650
Apples (1,000 bu.)....	2,914	1,900	2,465
Peaches (1,000 bu.)....	210	442	414
Pears (1,000 bu.).....	59	69	65
Cherries (tons)	2,275	2,390	2,460

ILLINOIS. East North Central state, United States; admitted to the Union Dec. 3, 1818. Population (1940): rural, 2,087,591; urban, 5,809,650; total, 7,897,241. Land area, 55,947 square miles, divided into 102 counties. Chief cities, with 1940 populations: Chicago, 3,396,808; Peoria, 105,087; Rockford, 84,637; East Saint Louis, 75,609; Springfield, the capital, 75,503; Oak Park, 66,015; Evanston, 65,389; Cicero, 64,712.

Chief State Officers, 1945.—Governor, Dwight H. Green; lieutenant governor, Hugh W. Cross; secretary of state, Edward J. Barrett; treasurer, Conrad F. Becker; auditor, Arthur C. Lueder; attorney general, George F. Barrett.

Judiciary.—Chief justice of the state supreme court, William J. Fulton; associate justices,

Charles H. Thompson, Walter T. Gunn, June C. Smith, Francis S. Wilson, Loren E. Murphy, Clyde E. Stone.

Legislature.—The state's General Assembly (Senate, 51 members; House of Representatives, 153) convenes biennially on the first Wednesday after the first Monday in January.

Education.—Public elementary school districts (1944), 10,009; teachers, 23,818; pupils, 848,017. Public senior high schools (1944), 861; teachers, 10,200; students, 320,569. Average yearly salary of all school teachers, \$1,430. Education in Illinois is compulsory for all children between the ages of 6 and 16, inclusive. There are 5 state supported teacher training schools in Illinois. Total state appropriation for education (1944), \$15,933,000.

Finances.—The following statement of Illinois' finances for the fiscal year 1944-45 was supplied by Conrad F. Becker, state treasurer:

Cash balance in treasury, beginning of fiscal year 1944-45.....	\$ 628,502,809.28
Receipts, 1944-45.....	374,683,194.22
Total.....	\$1,003,186,003.50
Disbursements (warrants paid), 1944-45.....	268,013,781.99
Cash balance, beginning of fiscal year 1945-46.....	\$ 735,172,221.51

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	PRODUCTION		
	Average 1934-43	Final 1944	Preliminary 1945
Corn (1,000 bu.).....	349,054	403,695	413,345
Oats (1,000 bu.).....	118,622	101,984	165,216

ILLUMINATION. See ELECTRICAL AND ALLIED DEVELOPMENTS OF 1945.

IMMIGRATION, EMIGRATION AND NATURALIZATION. The war profoundly affected the pattern of migration and naturalization, and the end of hostilities has witnessed a notable change in the direction of the trend of both immigration and naturalization. Whereas stringent wartime restrictions resulted in a sharp reduction of travel, there has been already a relaxation of travel control and an accompanying acceleration in the movement of persons to and from the United States.

In contrast to steadily increasing migration, naturalization decreased in 1945 after reaching

a peak the preceding year. Naturalization was significantly affected during the war years when United States citizenship took on added meaning and became an eagerly sought privilege. Because of this fact and because aliens in the United States had been subject to a number of important disadvantages in participating in the nation's war effort, the process of absorbing aliens through naturalization was greatly augmented.

As a consequence of reduced immigration and increased naturalization, together with the normal complement of deaths and departures, the alien population of the United States dropped from five millions at the time of the alien registration conducted during the latter part of 1940, to approximately three millions in 1945.

Immigration and Emigration.—During the fiscal year ended June 30, 1945, 38,119 immigrants were admitted to the United States. This figure represents an increase of 34 per cent over immigration during 1944. Of this number only 11,623 were quota immigrants as compared with the permissible annual quotas totaling 153,879 that may be admitted under the Immigration Act of 1924. In addition, 26,496 nonquota immigrants were admitted. These totals were somewhat higher than those for the preceding two years.

The newly arrived quota immigrants aggregated but 7.5 per cent of the established quotas; and, except for the Chinese with a quota of 105, no nationality exhausted its quota during the year. For the fourth consecutive year, nonquota immigration exceeded quota immigration. Of the 24,496 nonquota immigrants, 22,770 were admitted as natives of nonquota countries (chiefly Canada and Mexico). The remainder was made up of members of particular groups that are exempt from quota restrictions, such as alien wives and children of United States citizens, alien husbands married to United States citizens prior to July 1, 1932, and students.

During 1945, 93,362 aliens departed from the United States, of whom 7,442 were emigrants—aliens who have lived in the United States a year or longer and who are departing for a stay of at least a year.

The table below indicates the variations in immigration and emigration during the past five years.

A significant consideration with regard to transportation and immigration is the substantial increase in air travel to designated inland points, as well as to seaports and land border ports. The number of arrivals by plane advanced from 25,000 in 1935 to 251,000 in 1944, and rose to 400,000 in 1945. In the latter year approximately 65 per cent of all passengers arriving at seaports traveled by air. Although the increase in air travel was to some extent undoubtedly a result of the war, it is also doubtless an indication of a vast expansion to be expected in this means of transportation as these facilities are diverted to civilian use.

Because of the critical shortage of manpower in the United States, new legislation and regulations were adopted to make possible the tem-

ADMISSIONS AND DEPARTURES OF ALIENS, YEARS ENDED JUNE 30, 1941-1945

	1941	1942	1943	1944	1945
Aliens admitted.....	151,784	111,238	104,842	142,192	202,366
Immigrant.....	51,776	28,781	23,725	28,551	38,119
Quota.....	36,220	14,597	9,045	9,394	11,623
Nonquota.....	15,556	14,184	14,680	19,157	26,496
Nonimmigrant.....	100,008	82,457	81,117	113,641	164,247
Aliens departed.....	88,477	74,552	58,722	84,409	93,362
Emigrant.....	17,115	7,363	5,107	5,669	7,442
Nonemigrant.....	71,362	67,189	53,615	78,740	85,920

porary importation of alien laborers. These workers were generally imported under agreements with nearby countries which regulated the terms of their stay and the conditions of their employment. Of these laborers imported, there remained in the United States as of June 30, 1945: 135,680 from Mexico, 27,082 Jamaicans, 5,853 Bahamians, 5,700 Barbadians, 1,106 Newfoundlanders, and 916 British Hondurans. With the end of the war, these laborers are gradually being returned to their homelands.

Naturalization.—The number of persons admitted to United States citizenship during the fiscal year of 1945 was 238,450. This figure represents a 46 per cent decrease in comparison with the preceding year's 441,979 naturalizations, the largest number recorded in any single year since 1907, when consolidated statistical records of naturalization were inaugurated. The naturalization figures for the past two years may be compared with the average of 151,000 naturalizations granted during each year of the ten-year period 1931 through 1940. At the same time, it should be noted that declarations of intention to become a citizen dropped to the lowest point on record, with 31,195 declarations filed in 1945, as compared with 42,368 in 1944, 115,664 in 1943, and an annual average of 136,947 for the decade ending in 1940. The drop in the number of declarations filed and the decrease in the number of naturalizations may be attributed to the decrease in immigration—only 699,000 immigrants have been admitted in the last 15 years; to the elimination during the past three years of accumulated arrearages of naturalization cases pending; and to the fact that many of the remaining aliens are in the upper age brackets and possibly feel that the requirements for naturalization are too difficult to meet.

Among those who were naturalized during the fiscal year 1945 were 22,717 noncitizen members of the armed forces of the United States who were admitted to citizenship under special facilitating legislation. Of these persons, 5,666 were granted naturalization overseas. This procedure of naturalization abroad, which for the first time in history authorized the award of naturalization by administrative officials, was carried out by designated representatives of the Immigration and Naturalization Service, including some officers of the Department of State.

J. OWEN O'NEAL,
Research Analyst, Research and Educational Services Office, Immigration and Naturalization Service.

INCOME TAX LAW, New. Effective Jan. 1, 1946, the Congress, on July 20, 1945, passed, and President Truman on August 4 signed an act providing for the first major reduction in federal taxes since 1929. Under the new law, taxes on all individual incomes will be reduced, but the principal beneficiaries will be the corporations, and about 12,000,000 persons in the low income group who will be excused entirely from the payment of such taxes.

The most outstanding feature of the new law is the repeal of the 85.5 per cent excess profits tax on corporations. The law further reduces the regular corporation income tax from 40 per cent to 38 per cent on corporations with net profits in excess of \$50,000. These, together with other changes, will reduce the federal taxes that business will have to pay by an estimated \$3,136,000,000.

Reductions in taxes imposed on individual in-

comes are estimated to total \$2,644,000,000. These reductions range from 7 per cent on a \$1,000,000 income to the complete elimination of all income tax payments by persons who, under the existing law, pay only the 3 per cent normal tax levied on all net income above \$500.

Under the law in effect in 1945 no exemptions for dependents were permitted in order to arrive at the normal tax net income though the individual taxpayer was entitled to a personal exemption of \$500. However, when it came to arriving at a taxpayer's net income subject to surtax, the taxpayer was permitted to deduct not only \$500 for himself but an additional \$500 for each dependent. The new law makes these individual surtax exemptions—\$500 for the taxpayer and \$500 for each dependent—applicable to the normal tax. Under the new law, therefore, a married man will pay no income tax until his net earnings exceed \$1,000, and a married man with one child will pay no tax until his net income exceeds \$1,500. It is estimated that these exemptions of \$500 for each dependent will result in the payment of no income tax by at least one-fourth of 48,000,000 individuals who paid income taxes under the law in effect in 1945.

Individual taxpayers will benefit by a reduction of 3 percentage points from each surtax bracket. This means that in the first surtax bracket the tax will be 17 per cent instead of 20 per cent, and in the second bracket the tax will be 19 per cent instead of 22 per cent, and so on. These changes will be reflected in the taxes withheld from pay envelopes, so that hereafter a married couple, without children, will not be subject to deduction until the weekly income exceeds \$22, while the deduction from the salary of a single person making \$50 a week will be \$6.80 instead of \$8.20. Furthermore, after a taxpayer has determined the normal tax and surtax on his income, he may then deduct 5 per cent of the total of the two.

Under the new law the existing \$1,500 special tax-free allowance for officers in the armed forces is continued, and they are given three years in which to pay off back taxes in quarterly installments. Enlisted men are excused from the payment of taxes on service pay, and also have three years in which to pay off any accumulated back taxes from other sources.

Social Security taxes are frozen under the new law at 1 per cent instead of rising to 2½ per cent on both employer and employee as they were scheduled to do. The \$5 use tax on motor vehicles and boats is repealed at an estimated loss to the government of \$140,000,000 in revenue. However, the excise taxes (20 per cent) on furs, jewelry, and other luxuries, remains in effect, though there is a movement on foot in Congress to repeal them by July 1, 1946. They expire automatically six months after official declaration that the war has ended.

For income tax collected in fiscal year 1944-45 see under INTERNAL REVENUE.

INDIA. The central peninsula of southern Asia. Politically, in addition to the Indian Empire (see below), it comprises French India, Portuguese India, Bhutan and Nepal, the two last being independent states in treaty relations with the British government. The area of the peninsula of India is 1,655,143 square miles, and the population numbers 395,822,250.

The Indian Empire, indirectly or directly under British protection or rule, comprises territories governed by their rulers, with or without

the aid of ministers and councils, termed collectively the Indian States, and those areas subject to British law, which are known as British India. Since Jan. 1, 1877, British sovereigns have borne also the title of emperor (or empress) of India. The Indian Empire has an area of 1,581,410 square miles, and the population totals (1941 census) 388,997,955. The central government of India is also in treaty relationship with the rulers of Kuwait, Bahrein, Qatar, the Trucial States and Oman, maintaining political agents in those Arabian countries on the Persian Gulf.

The Indian States, which number 562, have varying degrees of internal autonomy, though posts and telegraphs, customs and (generally) currency, being matters affecting the Indian Empire as a whole, are administered by the central government. Administratively, the Indian States are grouped into 15 "States and Agencies," the latter being groupings of several small states. The combined area of the Indian States is 715,694 square miles and the populations at the 1941 census totaled 93,189,233. During recent years some of the groupings have been rearranged. Western India and Gujarat are now combined with Baroda; a new group termed Eastern States comprises Bengal, Chattisgarh, and Orissa; the Gwalior Residency has absorbed the former United Provinces; Cochin and Travancore are included in the Madras States Agency; and Punjab and Punjab Hill become the Punjab States Agency.

States and Agencies	Square miles	Population
Assam States	12,408	725,655
Baluchistan States	79,546	356,204
Baroda, Western India, and Gujarat States	53,482	9,217,868
Central India Agency	52,047	7,506,427
Eastern States	65,246	9,218,560
Gwalior Residency	27,768	4,934,629
Hyderabad State	82,313	16,338,534
Kashmir Residency	82,258	4,021,616
Kolhapur Residency and Deccan States Agency	10,870	2,785,428
Madras States Agency	10,757	7,991,647
Mysore Agency	29,458	7,329,140
North-West Frontier (States)	24,986	2,377,599
Punjab States Agency	49,521	6,594,198
Rajputana Agency	132,559	13,670,208
Sikkim	2,745	121,520
Total, states and agencies	715,964	93,189,233

British India comprises 11 provinces and six chief commissioners' provinces; the combined area is 865,446 square miles, and the population (1941 census) totaled 295,808,722. Each province is headed by a governor, who is aided by a council of ministers chosen from members of the elected provincial legislature; the chief commissioners' provinces are administered by the governor general, acting through chief commissioners appointed by him.

Provinces	Square miles	Population
Madras	126,166	49,341,810
Bombay	76,443	20,849,840
Bengal	77,442	60,306,525
United Provinces of Agra and Oudh	106,247	55,020,617
Punjab	99,089	28,418,819
Bihar	69,745	36,340,151
Central Provinces and Berar	98,575	16,813,584
Assam	54,951	10,204,733
North-West Frontier Province	14,263	3,038,067
Orissa	32,198	8,728,544
Sind	48,136	4,535,008
Chief Commissioners' Provinces:		
Ajmer-Merwara	2,400	583,693
Andamans and Nicobars	3,143	33,768
Baluchistan	54,456	501,631
Coorg	1,593	168,726
Delhi	574	917,939
Panth-Piploda	25	5,267
Total, British India	865,446	295,808,722

The People.—India contains a large number of races and castes, the latter being collections of families, or groups of families, bearing a common name and usually associated with a specific occupation. According to the census of 1931 (such returns for 1941 not being yet available), the chief races and castes were: Brahman, 15,207,277; Chamar, 12,195,156; Ahar, 14,170,032; Rajput, 10,743,091; Jat, 8,377,819; and Maratha, 6,113,061. In 1931 there were in India 155,555 British subjects, 12,579 persons of other European races, and 138,395 Anglo-Indians. An Anglo-Indian is one whose father, grandfather or other progenitor in the male line was a European.

Exclusive of dialects, 225 languages are spoken in the Indian Empire. The eight principal languages, and the numbers speaking them in 1931, comprise: Western Hindi, 71,547,000; Bengali, 53,469,000; Bihari, 27,927,000; Telugu, 26,374,000; Marathi, 20,890,000; Tamil, 20,412,000; Punjabi, 15,839,000; and Rajasthani, 13,898,000. Other languages widely spoken are Kanarese, Oriya, Gujarati and Malayalam. The lingua franca is Hindustani, a dialect of Hindi, while English is understood by many.

Religion.—Hindus constitute 655 per 1,000 of the total population of the Indian Empire, Muslims 236, Christian 16, Sikhs 14, Parsis 0.3, and Buddhists 0.6. The 1941 census showed the distribution of the population by communities, whereas previous censuses gave the distribution by religions. Distribution in 1941 was as follows:

	Indian States	British India	Total
Hindus	64,219,553	190,810,953	255,030,506
Muslims	14,990,925	79,398,503	94,389,428
Christians	2,834,119	3,482,430	6,316,549
Sikhs	1,526,350	4,165,097	5,691,447
Jains	870,914	578,372	1,449,286
Parsis	12,922	101,968	114,890
Buddhists	64,590	167,413	232,003
Jews	3,153	19,327	22,480
Tribes	8,728,233	16,713,256	25,441,489
Others	38,474	371,403	409,877

Education.—With only 12.9 per cent of the people living in towns (179,000,000 reside in villages having less than 2,000 population), education of the masses has progressed but slowly. According to the 1941 census, the percentage of literacy within the Indian Empire was 12.2 (as against 6.9 in 1931); for the Indian States it was 11.1 (6.6 in 1931), and for British India 12.5 (7.1 in 1931). Education in British India is controlled by Indian ministers of provincial governments; and recruitment of Europeans for the Educational Service has ceased since 1924. In British India, in 1941-42, there were 228,053 educational institutions, with a total enrollment of 15,993,187 students. General education was provided in 181,968 primary schools (with 12,018,726 pupils), 15,197 secondary schools (2,784,789 pupils), 338 arts and science colleges (119,731 pupils), and 15 universities (12,532 students). Special education was given at 11,691 special schools (with 446,287 pupils), 612 training schools (32,121 pupils), and 93 professional colleges (26,991 students); and there were 18,139 indigenous unrecognized institutions (with 552,010 pupils). Plans published in 1944 for postwar educational development aimed to provide every child in India with a minimum basic education. Compulsory attendance is required for children between the ages of 6 and 14, primary and middle school education being free. The government of India has assumed the cost of transportation, maintenance, and tuition fees for 1,500 students to be sent to the United

States for postgraduate work (500 men in each of the years 1945, 1946, 1947); at 40 different American institutions, in a wide range of subjects, the students will take courses lasting two or three years.

Cities and Towns.—The capital of the Indian Empire is New Delhi (pop. 64,855); Delhi, which comprises New Delhi, Shahdara and Cantonment, had a population (1941) of 521,849. The three largest cities, all of them ports, are Calcutta (pop. 2,108,891), Bombay (1,489,883) and Madras (777,481). Hyderabad (739,481), capital of the state of that name, is the largest city in the Indian States. Other large cities are Lahore (671,659), Ahmedabad (591,257), Cawnpore (487,324), Amritsar (391,010) and Lucknow (387,177).

Government.—The Government of India Act of 1935, legislation of the British Parliament, provided that the central government of the Indian Empire was to be a federal union of the Indian States and the provinces of British India, a federation which would come into being when a certain proportion of the rulers of the former had agreed to join. Provincial self-government as outlined in the act began in 1937, but negotiations with the rulers of the Indian States were suspended by outbreak of the Second World War in 1939. The governor general, or viceroy, is appointed by the king-emperor, usually for a term of five years; Field Marshal Viscount Wavell was appointed governor general Oct. 20, 1943. He is assisted by an Executive Council of 15 members, each responsible for a department of the administration and appointed by the crown; Indians hold all portfolios except those for War, War Transport, Finance, and Home. The Indian legislature comprises two houses—the Council of State and the Legislative Assembly. The Council of State, which has a life of five years, consists of 60 members, including 34 elected (one of whom, though technically nominated, is nominated as the result of elections held in Berar) and 26 nominated, of whom not more than 20 may be officials. The Legislative Assembly, with a life of three years, has 141 members, of whom 102 are elected (including, as in the case of the Council of State, one Berar member who, though actually elected, has technically to be a nominee); of the 39 nominated members, not fewer than one third are required to be nonofficials. Because of war conditions, the life of the Indian legislature was extended for a further 12 months from Oct. 1, 1944; elections for both the central and provincial legislative assemblies were ordered to be held, the former in November-December 1945, and the latter early in 1946.

The Indian States are governed by hereditary rulers (princes) who exercise varying degrees of control over internal affairs, under British suzerainty, and within certain limits maintain their own military forces; they have no relations with foreign powers. Neither the Indian legislature nor the provincial legislatures of British India can make laws affecting them; neither the Federal Court of India nor the chief courts of the provinces have jurisdiction in the Indian States; and since the Indian States are not British territory, their inhabitants are not British subjects but British protected persons. The Chamber of Princes, a consultative body, consists of 109 rulers of states who are members in their own right, and 12 rulers elected to represent 127 other states; in 1942 the Chamber of Princes stated its willingness to co-operate in framing a new con-

stitution for an Indian federal union provided that the sovereignty and integrity of the Indian States was safeguarded.

The 11 provinces of British India have each a Legislative Assembly, and there are, in addition, legislative councils in Madras, Bombay, Bengal, United Provinces, Bihar and Assam. The Legislative Assembly of each province, unless sooner dissolved, continues for five years; the legislative councils are permanent bodies, one third of the members retiring every third year. Provincial legislators are elected by ballot, the franchise being based on a property qualification as measured by the payment of a prescribed minimum of land revenue, income tax, or municipal taxes; women vote and hold office on the same basis as men. The vote was exercised (1944) by 30,137,914 of the adult population, including 4,254,704 women. The electorates are arranged to give separate representation to the various races, communities and special interests within each province. The governor heading each province selects members of the provincial ministry from those legislators (including members of minority communities) likely to command the confidence of the legislature. Because of unwillingness to co-operate in the war effort, and the resignations of ministers affiliated with the All-Indian Congress Party, several of the legislatures were suspended, the governors, in those instances, administering the provinces through councils of advisers; in 1945, responsible self-government was continuing in 4 of the 11 provinces.

In 1945 an Indian, Sir Chandulal M. Trivedi, was appointed governor of the province of Orissa. He is the second Indian to be appointed permanent governor of a province of British India.

Political Parties.—The chief political parties in British India are the All-India Congress, the Muslim (Moslem) League, and the Hindu Mahasabha: minor parties include the National Liberal Federation, the Depressed Classes Federation, and the All-India Kisan Sabha (or Peasants' Union). Although not its president, Mohandas K. Gandhi is the recognized leader of the All-India Congress, Maulana Abul Kalam Azad being its president and Puandit Jawaharlal Nehru the secretary; Mohammed Ali Jinnah heads the Muslim League. Gandhi, who had been imprisoned in 1942, was released May 6, 1944 "solely on medical grounds." In June 1945, following the new offer of the British government (see *Principal Events*), all the members of the All-India Congress' working committee who, along with Gandhi, had been imprisoned in 1942, were released. This step was followed by the release of other Congress internees and the removal of the ban on the activities of the working committee.

Finances of British India.—The financial year 1944-45 was expected to close with a revenue deficit of Rs.155.7 crores (one crore being equal to 10,000,000 rupees). The total revenue estimates for 1945-46 amounted to Rs.353.74 crores, compared with Rs.356.88 crores for the preceding financial year, and the deficit in prospect was Rs.163.89 crores. Budget estimates of defense expenditure for 1945-46 amounted to Rs.394.23 crores and Rs.17.76 crores under the revenue and capital heads respectively.

Great Britain had a tremendous economic and financial stake in India at the end of the First World War, but in the intervening years this relationship has been virtually reversed. While In-

dia's sterling debt in 1939 had amounted to £352,000,000, by August 1945 it had been reduced to £664,000. This was due to India's large favorable balance of merchandise trade (exports largely exceeding imports) and to payment by Britain of a large share of the cost of war expenditure in India and of Indian troops abroad. In practice, Indian authorities provide the funds needed for this expenditure in rupees, and are reimbursed by the British government for its share, in sterling. These sterling payments are added to the reserve of the Reserve Bank of India, in London, which then issues a corresponding amount of new currency in rupees. The holdings of the Reserve Bank as of Jan. 31, 1945, amounted to Rs.1,304 crores. Industrial and commercial enterprises in India are passing at a rapid rate from British to Indian hands. British investments in India do not now exceed £200,000,000 sterling (far less than those in, for instance, Argentina and Brazil), and Indian investors now hold 75 per cent of the securities of the Indian government formerly held by British investors.

Reverse lend-lease (reciprocal aid) provided by India to the United States amounted to \$374,325,000 by the end of the financial year 1944-45. This was for major goods and services, and did not include all those handed over or made available to American armed forces and shipping. With effect from April 1, 1944, India also agreed to provide raw materials and certain available commodities to the United States government for war purposes. The Indian government also made a contribution of \$24,000,000 for the expenses of UNRAA; Francis B. Sayre headed an UNRRA mission which visited India in July 1945 to discuss the procurement of jute, peanut oil, and other Indian commodities against the government's contribution.

India's War Effort.—At the time of Japan's surrender the strength of the armed forces of India had risen to over 2,500,000 men, all volunteers, these figures excluding the increased numbers of troops raised and maintained by the Indian States and placed at Britain's disposal. Besides furnishing 700,000 men for the campaign in Burma, India sent over 300,000 troops to serve overseas—principally in the Middle East and Italy. Of the 27 Victoria Crosses (highest decoration for gallantry in the British Empire) won in the Burma campaign, 20 were awarded to officers and men of the Indian Army. Commissioned Indian officers increased from 307 in 1939 to over 10,000 in 1945, representing 35 per cent of the officer strength of the Indian Army; Indian and British officers alike have European and Indian troops under their command. The Indian Air Force, entirely Indian in composition, had 10 squadrons during the war, and the Royal Indian Navy was expanded to 15 times its pre-war strength. When the Japanese surrendered at Singapore on Sept. 12, 1945, the Indian Army was represented by Brig. K. S. Thimayya, and Capt. the Maharaja of Cooch Behar represented the forces of the Indian States. Down to May 31, 1945, the armed forces of India had incurred casualties amounting to 177,315; this total comprised 23,295 killed, 62,064 wounded, 12,264 missing, and 79,692 prisoners of war. During the war, Great Britain met the full cost of all Indian troops (with the exception of one division) serving outside India; Britain's expenditure on this account down to April 1945 totaled about £1,031,000,000.

Agriculture and Livestock.—The chief occupa-

tion of the people of India is agriculture, which engages some 120,000,000 of the population of the Indian Empire. The total area of land suitable for cultivation, exclusive of forest land, is about 536,000,000 acres (including 175,000,000 acres of culturable waste); of this acreage, 435,000,000 acres are in British India, and 101,000,000 acres in the Indian States. One third of India's area is cultivated, compared with 18 per cent in the United States.

India produces virtually all the world's jute; is the largest producer of sugar cane; and ranks second as a grower of rice, tea, tobacco and cotton, in the latter two instances being outstripped by the United States. Rice is the staple food for all low-lying, well-watered tropical districts; wheat is the staple food crop in a great part of northern India; and millets are the staple foodstuffs in areas which are too dry or infertile for rice or wheat. The exportable surplus of tea in 1945-46 was expected to amount to 375,578,058 pounds, and 5,094,000 bales of cotton (400 pounds each) was the anticipated yield from 20,398,000 acres in 1943-44. While India normally depends on imports of rubber to meet her own needs, during 1942-44, with 90 per cent of the world's crude rubber producing areas in Japanese hands, India was able to make 11,500 tons of rubber available to the United Nations; she accomplished this by greatly increasing the output of plantations on the Malabar coast and by organizing the collection of wild rubber on the Assam frontier. During the 1944-45 season, 2,923,000 acres were under jute. The acreages in 1943-44 and crop forecasts of other products are shown below:

Crop	Acres	Tons
Rice	79,960,000	30,603,000
Wheat	33,651,000	9,851,000
Cane sugar	4,113,000	5,696,000
Peanuts	8,531,000	3,305,000
Linseed	3,518,000	395,000
Rape	5,484,000	955,000
Sesamum	4,306,000	455,000
Castor seed	1,202,000	109,000

Other agricultural products of India are coffee, rubber, coconuts, hemp, pepper, cinchona, indigo, and opium. India possesses approximately 205,000,000 head of cattle (about three times as many as the United States), out of a world total of 595,537,000; there are 42,000,000 sheep, and large numbers of horses and goats. India has the world's largest system of artificial irrigation, some 55,000,000 acres being watered; the Mettur Dam, on the Cauvery River in Madras Presidency, is the second largest dam in the world. There are 135,000 square miles of forests in India; postwar reconstruction plans envisage the creation of 100,000 square miles of new forest in British India.

The conifer forests of the lower Himalayas supply the pulp for a growing paper-making industry; teak, deodar and sal are used for constructional work; and sandalwood, rosewood and ebony are the most important of the decorative woods. India has a practical monopoly of the shellac market, producing about 30,000 tons annually from lac, the resinous exudation of a small insect. Mulberry trees in Kashmir, the Punjab, Mysore, Madras, and Bengal provide sustenance for the silk worms of a considerable silk-spinning industry.

Minerals.—Most of the coal reserves, estimated at 76 milliard tons, is of low quality; with a production of 29,338,000 tons in 1940, India ranked eighth among the world's producers. Production of petroleum (in Assam and the Punjab)

is on a limited scale, only 311,000 tons being produced in 1940. India claims the largest reserves of high-grade iron ore in the world (total reserves of 20 billion tons); iron ore with a metal content of 1,994,000 tons was produced in 1939. India leads the world in production of sheet mica and ilmenite, and has the world's largest deposits of steatite. About 1,500,000 tons of salt are produced annually, but in addition 400,000 tons must be imported each year to meet the country's needs. With an output of 845,000 tons of manganese ore in 1939, India ranked second to the Soviet Union. Other minerals include copper, magnesite (40,000 tons in 1940), chrome ore, gold (289,433 fine troy ounces in 1940), graphite, monazite, and bauxite.

Production.—Within the British Empire, only Great Britain is a larger producer of iron and steel than India; in 1940-41, India turned out 1,896,000 tons of pig iron, 1,217,000 tons of steel ingots, and 1,178,000 tons of finished steel. During the war, production was greatly increased. The Tata Iron and Steel Works at Jamshedpur, wholly Indian-owned, are the largest single steel works in the British Empire. Next to iron and steel manufacture, the most important industry is the making of textiles. Less than 7½ per cent of the cotton piece goods consumed annually in India are imported. In 1942 there were 396 cotton mills, with 10,026,425 spindles and 200,170 looms; annual production of cotton textiles amounts to about 7 billion yards. Jute mills numbering 113 produced 1,100,900 tons of jute in 1940-41. Indian wools are woven into carpets and blankets, and imported wools into finer grades. Spun silk mills in Mysore and elsewhere produced large quantities of parachute silk. In 1939-40 nearly 70,000 tons of heavy chemicals were produced in India, including 30,000 tons of sulphuric acid and 20,000 tons of ammonium sulphate; methyl alcohol acetone and calcium acetate are produced, as well as such chemicals formerly imported as soda ash, caustic soda, sodium bicarbonate, bleaching powder, chlorine, bromine, and various classes of magnesium products. Other manufactures included matches (21,968,000 gross boxes in 1939-40), paints (35,000 tons in 1939-40), glue, glass, soap, aluminum, cement shoes, rubber goods, plywood, and foodstuffs. The aircraft industry was organized and developed during the war. Instruments were manufactured in great variety and aircraft assembled, and indigenous materials were used to make tanks for aircraft. The shipbuilding industry was greatly expanded; during 1943-44, 100 small vessels of various types were constructed, and ships of the United Nations with an aggregate tonnage of more than 26,000,000 were repaired. India's naval dockyard built for the British Admiralty a floating dock which is one of the largest in the world.

The Indian government announced on April 23, 1945, that it planned to take control of the powers for development of certain industries which had hitherto been vested in the various provincial governments. The rapid strides made in the past by the sugar, cotton textile, and iron and steel industries had been due largely to encouragement given by the Central government, which now proposed to assist such basic industries of national importance as aircraft, automobiles and tractors, chemicals, prime movers, machine tools, and electrical machinery. The government would be prepared to make loans or to subscribe a share in the capital of industrial undertakings; to guarantee a minimum dividend

on capital or meet revenue losses for a fixed number of years; to support research organizations; and to ensure that taxation did not hamper development. In August the government published its five-year program for development of industrial and scientific research at an estimated cost of Rs.50,000,000. A technological institute on the lines of the Massachusetts Institute of Technology is to be established; nine specialized laboratories are to be built and equipped; and the scientific departments of the universities are to be strengthened and 700 research workers are to be trained within five years.

External Trade.—India's total foreign trade increased vastly during the war, the loss of European and Japanese markets being more than compensated for by increased exports to the United States, Latin America, China, and Egypt. Excluding the value of exports and imports on account of defense, and of transactions under lend-lease (both of them considerable items), the total foreign trade of British India increased from Rs.298 crores in 1942-43 to Rs.317 crores in 1943-44. Imports in 1943-44 were valued at Rs.118 crores (Rs.110 crores in 1942-43), and exports at Rs.199 crores (Rs.188 crores in 1942-43). In the first half of the financial year 1944-45 both imports of foreign merchandise and exports of Indian merchandise increased considerably, as shown in the following table comparing the figures with the like period of 1943-44:

	First Six Months 1943-44	1944-45	Difference
	(in crores of Rs.)		
<i>Imports of foreign merchandise:</i>			
Foodstuffs	3.57	9.07	+5.50
Raw materials	28.35	55.35	+27.00
Manufactures	19.52	28.21	+8.69
Total (including miscellaneous)	52.22	93.90	+41.68
<i>Exports of Indian merchandise:</i>			
Foodstuffs	21.78	21.04	-.074
Raw materials	19.25	24.12	+4.87
Manufactures	51.30	62.68	+11.38
Total (including miscellaneous)	93.43	109.23	+15.80
Re-exports	3.31	5.09	+1.78
Total exports	96.74	114.32	+17.58
Total visible balance of trade in merchandise	44.52	20.42	-24.10

The principal items of imports showing an increase were grains (Rs.4.35 crores), oils (Rs.21 crores), and raw cotton (Rs.6 crores); chief decreases in exports were spices (Rs.32 lakhs), provisions (Rs.23 lakhs) and sugar (Rs.16 lakhs). The share of the United States in the external trade of India increased by Rs.4.55 crores (Rs.17.05 crores in the first half of 1943-44 and Rs.21.60 crores in the like period of 1944-45). India buys only 21 per cent of her imports from Great Britain (63 per cent in 1914, during the First World War) and sells 31 per cent of her exports to that country (25 per cent in 1914); thus, Britain is now buying more goods from India than she is selling to her.

Communications.—The railroad system of India is the fourth largest in the world. The route mileage open to traffic in 1945 was over 41,000; about 50 per cent was of standard gauge (5 feet 6 inches), and some 42 per cent of meter track (3 feet 3¾ inches), the remainder being narrow gauge track (2 feet 6 inches). Most lines were owned by the state. In 1944-45 some 960,000,000 passengers were carried, compared with 622,333,100 in 1942-43. Postwar plans included the construction of 3,000 route miles of additional railroad track and the ex-

penditure, over seven years, of Rs.3 billion on rehabilitation and establishment of plants to build locomotives. In 1944 there were over 300,000 miles of highways in British India, about one third of the mileage suitable for automobile traffic in all seasons. At outbreak of war the state-owned telegraph system comprised 556,000 miles of overhead wires and 118,400 miles of aerial, underground, and submarine cable conductors. All telephone systems in the country are also under state management. The telegraph and telephone channels were increased fivefold by 1945. Tata Air Lines and the Indian National Airways operated during the war on behalf of the government; during 1944 the companies flew a total of 2,100,000 miles, carrying 13,250 passengers and 1,540,000 pounds of mails and freight; the total traffic carried amounted to approximately 1,500,000 ton-miles. The government operates the All-India Radio (AIR) broadcasting system; besides broadcasts in several Indian tongues, AIR puts out programs in 15 foreign languages. A direct commercial radio telegraph circuit between India and the United States was opened in 1944.

Principal Events of 1945.—The stalemate in Anglo-Indian relations which had continued throughout the war was not broken in 1945 despite many sincere efforts. With internment in 1942 of leaders of the All-India Congress Party for instituting a civil disobedience movement, influence of the predominantly Hindu organization waned, the Muslim League making the most of the opportunity to strengthen its position throughout British India. Although the viceroy, Lord Wavell, had failed in 1944 to persuade the rival Indian parties to co-operate, he resumed the attempt the following year. In May 1945, Lord Wavell went to London for consultation with Winston Churchill's Cabinet, and on May 14, following his return to New Delhi, the British government published a White Paper making new proposals for a greater measure of self-government for India. Simultaneously with its publication all Congress leaders still under detention were released, and thus the way was open for full consideration of the plan. An interim government would function until self-government is initiated under a new constitution drawn up by the Indian parties themselves, an Executive Council (Cabinet) being selected by the viceroy from lists submitted by the leaders of Indian parties; the council, which was to represent all the principal communities, would contain equal numbers of caste Hindus and Muslims. With the exception of the viceroy and the commander in chief, all members of the council were to be Indians and (as is the case in the Dominions) a British high commissioner was to represent Great Britain's commercial and other such interests in India.

At the invitation of the viceroy, Indian leaders met in Simla on June 25 to consider the British proposals for a new Executive Council. The All-India National Congress was represented by its president, Maulana Abul Kalam Azad (a Muslim), by Pundit Jawaharlal Nehru, its secretary, and others, but not by Mohandas K. Gandhi, who elected to act only in an advisory capacity. Other leaders at the conference included Dr. Syamaprasad Mookerjee, president of the Hindu Mahasabha (mainly representing the interests of the Orthodox Hindus); Mohammed Ali Jinnah, president of the Muslim League; Tara Singh, leader of the Sikh community; Dr. P. N. Bannerji, leader of the Nationalist group in the Cen-

tral Assembly; and Dr. A. M. Ambedkar, leader of Harijams (scheduled classes—the Untouchables). Lord Wavell invited the conference to submit to him an agreed list of names from which he might choose the membership of the new Executive Council, and it was due to the inability of the Indians to agree that the whole project foundered. Communalism—the long-standing conflict between Hindus and Muslims—was once more the reason for disagreement. A list of names submitted by the Congress Party contained, besides Hindus, representatives of all communities, including Muslims, Sikhs, Untouchables, and Christians (the last, Rajkumari Amrit Kaur, a woman in whose house Gandhi was staying); this co-operative attitude of the party was in striking contrast to its previous practice of abstention. Breakdown of the conference came when Jinnah claimed the right to nominate all of the Muslim members of the Executive Council, denying the assertion of the Congress Party that it was representative of all Indians. While Jinnah's Muslim League was undoubtedly the strongest party of his co-religionists, there were two provinces of British India which did not owe it allegiance—the Punjab, which had in its elected government a Unionist Party majority, and the North-West Frontier province, which had as premier a member of the Congress Party. It was therefore unreasonable for the Muslim League to demand the right to name all Muslim members, but was understandable by its genuine fear derived from experience of the Congress Party's provincial administrations during the years 1937–39. It had been due solely to Lord Wavell that the British government made the White Paper offer, and he shouldered the blame for its rejection by the Indians. When closing the conference on July 14 he acknowledged its failure, which “nobody can regret more than myself. I wish to make it clear that the responsibility for the failure is mine. . . . If it had succeeded, its success would have been attributed to me, and I cannot place the blame for its failure upon any of the parties.” In this, at least, the parties agreed—all of them blamed the British.

On Aug. 21, 1945, it was announced that general elections to the central and provincial legislatures in British India were to be held in the cold weather season of 1945–46; the last elections for the Council of State had been held in 1930, for the Legislative Assembly in 1934, and for the 11 provincial legislatures in 1937. The Muslim League planned to fight the elections on the issue of Pakistan (separate sovereign Muslim states) and to decide whether or not it was the sole representative organization of the Muslims; the All-India National Congress decided to contest the elections on the issue of immediate transfer of power to the people. The results of the general election for the Legislative Assembly were announced on Jan. 1, 1946. The Congress Party received 59.6 per cent of the total votes cast, winning 56 seats; the Muslim League won 30 seats, and the Independents six, the remaining 10 seats going to members of other parties.

During August–September, Lord Wavell visited London again in order to consult with the new Labour government, and on September 19 he broadcast from New Delhi the announcement that a constitution-making body was to be convened as soon as possible; preliminary to that step, immediately following the general elections, he proposed to consult representatives of

the provincial assemblies to ascertain whether the 1942 declaration (the Cripps offer) was acceptable or whether an alternative or modified scheme was preferable. Representatives of the Indian States (which had not been invited to the Simla Conference) would also be consulted in order to ascertain in what way they would best take their part in the constitution-making body. Before that body met, the viceroy stated, the British government would publish the draft of a treaty which will require to be concluded between Great Britain and India should that country acquire complete independence or Dominion status.

Meanwhile, India was accorded recognition at many international gatherings. At the United Nations Conference on International Organization in San Francisco, India's delegation comprised Sir Ramaswami Mudaliar, who had served on the Imperial War Cabinet and the Pacific War Council; Sir Firoz Khan Noon, a colleague in those posts; and Sir V. T. Krishnamachari, prime minister of Baroda. Sir Girja Shankar Bajpai, agent general to the government of India in the United States, presided over the third session of UNRRA, held in London in August; and he represented India during October at the meetings of the United Nations Food and Agriculture Organization, in Quebec, and of the Far Eastern Advisory Commission, in Washington.

Despite the uncertainty as to the future status of India, the central government also went ahead with postwar plans. In consultation with the provincial administrations, the Department of Planning and Development prepared five-year schemes which included large irrigation and hydroelectric projects supplementing those already initiated in the Punjab, Bengal, and Madras. Excluding the new plans for Bengal, the total cost was put at well over Rs.6,000,000,000; the current Damodar Valley project in Bengal is to cost Rs.500,000,000, and additional hydroelectric schemes in that province will require a further Rs.1,500,000,000. The central government will reimburse the provinces up to 25 per cent of the expenditure on unproductive schemes, subject to a maximum of Rs.5,000,000,000. In order to obtain sufficient skilled men, technicians already employed in factories are to be sent for further training either to Great Britain or the United States.

INDIAN AFFAIRS. With the resignation of John Collier as commissioner of Indian Affairs in March 1945, the longest commissionership ever served by one appointee was terminated. He had assumed office in 1933. Mr. Collier's successor, William A. Brophy, had served as special attorney to the Pueblo Indians since 1934.

The twelve years just past witnessed a complete reversal of the basic policies operating in Indian administration, policies which had been fairly constant since 1887. That was the year in which Congress adopted the General Allotment Act, the purpose of which was the dissolution of Indian tribes by individualizing tribal property and by various legal devices. The 1887 Act was, in fact, a reversal of the historical position which the United States had assumed in its relations with the aboriginal occupants of the country. Indian tribes had been treated as sovereign bodies.

The federal constitution specifically reserved to the Congress the power "to regulate commerce with foreign nations, and among the several states, and with the Indian tribes." This intent of the Constitution makers was further defined by Chief Justice Marshall in the *Worcester v. Georgia* decision, in which he held that "A weaker power does not surrender its independence—its right to self-government—by associating with a stronger, and taking its protection." He used the expression "domestic, dependent nation" to describe the relationship of an Indian tribe to the federal government. Up until 1871 the United States entered into some 370 formal treaties with Indian tribes. The treaty method of governing Indian affairs was then abandoned, not because of an abandonment of the legal doctrine of tribal sovereignty, but rather because the lower house of Congress insisted on sharing in the formulation of Indian policy. Since it was required to appropriate money to carry out Indian treaties, it desired a voice in determining the purposes for which public monies would be spent. Formal agreements were then substituted, in which both houses of Congress must concur.

The law of 1887 was the first formal break in the long established policy. It represented a decision in the minds of the public men charged with responsibility in the administration of Indian affairs to accelerate the process of assimilating Indians into the citizenry of the nation. It was felt that the Indians occupied the anomalous position of being born in the United States without having the rights and responsibilities of citizenship. Moreover, Indian tribes in many instances occupied large areas of territory which stood in the way of westward settlement. The country had just gone through a period of border warfare, during which Indians had tried to hold intact some part of their fast diminishing domain. Their efforts had been irritating to the empire builders who wanted no opposition to their appointed task of taking over a continent.

The General Allotment Act of 1887 was rather disastrous in its effects on Indian life. In the following 45 years Indian land holdings were diminished at the rate of 2,000,000 acres per year. From a total area of 138,000,000 acres, the Indian estate was reduced to roughly 50,000,000 acres in 1933. The Indian population, which had numbered approximately 800,000 within the area of the United States at the time of discovery by white men, sank to a low of less than 250,000 during this period. Ceremonial practices were banned, Indian languages were forbidden in schools operated by the federal government, and administration of Indian affairs was a matter of absolutist rule. For all of this loss of Indian property and disruption of Indian life, there was no compensating advantage to the nation. Indians did not enter the body of citizenry; instead they remained on their diminished and impoverished acres and, in the areas where the lands had been allotted, came more and more to depend on public relief.

Mr. Collier, at the beginning of his administration, was faced with a situation which if it was to continue could only mean a deepening impoverishment and despair in the Indian population. By that time, indeed, the medical care furnished by the Indian Service, through arrangements with the Public Health Service, had considerably improved and as a result the Indian population had begun to increase. The birth rate among Indian tribes had always been high, and once the mortality rate was checked, growth of

the population was immediately realized. This, of course, in view of the diminishing resources, only intensified the economic problem. The first fruit of the Collier administration was the adoption by Congress of the Indian Reorganization Act, which (a) discontinued the practice of making individual allotments of tribal lands; (b) authorized funds for the purchase of lands; (c) established a revolving credit fund, giving Indians access to an adequate source of credit for the first time; (d) authorized Indian tribes to form political organizations and to incorporate under federal charters; (e) gave Indians employment preference in their own Indian service; and (f) established educational loans for vocational and higher education.

The twelve years of the Collier administration resulted in an addition of approximately five million acres of land through purchase and through various acts restoring lands formerly classified as Indian and in which the Indian title had not been extinguished. Credit funds of approximately \$5,000,000 were made available, which through relending operations, have resulted in a total of outstanding credit of \$8,000,000. Indian cattle holdings increased from 171,000 head in 1932 to 335,000 in 1944, and the income from this source increased from \$338,000 to \$6,318,986 in the same period. The total income from sales of livestock and livestock products in 1944 was approximately \$14,000,000, as compared with \$1,300,000 in 1932. Comparable gains were made in other forms of agriculture and in timber and mineral production.

Apart from these material gains, Indians were revested with the same rights of spiritual freedom enjoyed by other citizens of the United States. An act of Congress in 1924 had bestowed citizenship on all Indians born within the United States. Now they were guaranteed the religious freedom written into the federal constitution, which meant freedom to their own ceremonial life and to the language and cultural practices native to them. The educational policy shifted from an over-concern with academic training, which in previous decades had made very little progress in achieving literacy among Indians, and placed emphasis instead on winning a livelihood in the environment in which Indians live. Academic and vocational training for those who desired it and were prepared to profit from it was made more effective. The Indian health service was still further improved through the construction of a number of modern hospitals and through a concerted attempt to reach the Indian in his environment with the medical practices developed by the white man. Not the least of the accomplishments of the Collier administration was the improvement in personnel standards, resulting in the employment of persons professionally equipped to deal with the problems confronting the Indian people.

The record of the Indians in the Second World War becomes increasingly spectacular as the details of Indian achievement are released to the public. We now learn for the first time of the effective use which the Marine Corps made of Navajo Indians in its Pacific campaigns. These Navajo Indians were especially trained in communications work and working in teams of two men, they maintained voice communications between forward and command post positions most effectively. They participated in every action from Guadalcanal to Okinawa and must account in some part for the close co-ordination which the marines achieved in their amphibious operations. An Osage Indian, Maj. Gen. Clarence L.

Tinker, led the assault on the Japanese Fleet in the Battle of Midway and was shot into the ocean. A Cherokee Indian, Rear Admiral James Joseph Clark, first commanded the aircraft carrier *Yorktown* and had risen to command of a carrier squadron in the battle for Saipan. An Indian, Pfc. Ira Hayes, was in the small group of marines who planted the flag on Iwo Jima. Still another Indian was the first American soldier to enter Berlin. The Congressional Medal of Honor has been awarded to three Indians.

The 45th Division, which covered itself with honor in Sicily and Italy, had a number of Indians in its ranks, and its emblem was appropriately the Thunderbird. The war brought about the greatest exodus of Indians from reservations that has ever taken place. Out of a total of approximately 65,000 able-bodied men between the ages of 18 and 50, one-third went into the armed forces and an equal number was engaged in war industries and essential war services. Notwithstanding this great loss of manpower at home, the production of agricultural commodities on Indian lands increased steadily all through the war years.

A decision vitally affecting the Indians of Alaska was issued during the year. The United States had never entered into a treaty with any of the Alaska natives, and as a consequence there has been uncertainty as to the nature of the rights which these natives enjoyed in the lands of the territory. The United States Supreme Court has been consistent in holding that aboriginal rights of occupancy held good even in the absence of a treaty recognizing the extent or degree of occupancy. The latest affirmation of this doctrine was handed down by the Supreme Court in the case of *United States v. Santa Fe Railroad Company*. The case involved the Walapai Indians, with whom no treaty had been made and whose lands were involved in a grant made by Congress to a railroad company. The Supreme Court held that notwithstanding the grant to the railroad company, the right of occupancy of the Indians had not been extinguished and therefore they were entitled to regain the lands which the railroad company had been using since 1868, the date of the grant. Applying this doctrine to the natives of Alaska, the solicitor for the Department of the Interior in 1942 ruled that the natives of Alaska might assert claims to areas occupied by them from immemorial time. Following this decision, three villages in southeastern Alaska petitioned the Secretary of the Interior for an opportunity to be heard with respect to their occupancy rights. A former judge of the New Mexico Supreme Court, R. H. Hanna, conducted hearings as a result of which a determination was made that as to the total area claimed by these villages, some 92 per cent had been abandoned or had never been used exclusively by the Indians. The remaining 8 per cent of the area claimed was recognized as continuing in Indian use and occupancy. Whether or not the Indians of these villages will be satisfied with this determination or whether they will appeal the decision through some possible court action is not known at this time.

D'ARCY McNICKLE,
Office of Indian Affairs.

INDIANA. East North Central state, United States; admitted to the Union Dec. 11, 1816. Population (1940): rural, 1,540,084; urban, 1,887,712; total, 3,427,796. Land area, 36,205, divided into 92 counties. Principal cities, with 1940 populations: Indianapolis, the capital, 386,-

972; Fort Wayne, 118,410; Gary, 111,719; South Bend, 101,268; Evansville, 97,062; Hammond, 70,184; Terre Haute, 62,693; East Chicago, 54,637; Muncie, 49,720.

Chief State Officers, 1945.—Governor, Ralph F. Gates; lieutenant governor, Richard T. James; secretary of state, Rue J. Alexander; treasurer, Frank T. Millis; auditor, Alvan V. Burch; attorney general, James A. Emmert.

Judiciary.—Chief justice of Indiana's Supreme Court, Frank N. Richman; associate justices, Oliver Starr, Howard S. Young, Frank E. Gilkison, Mart J. O'Malley.

Legislature.—The state General Assembly (Senate, 50 members; House of Representatives, 100) convenes biennially in odd years on Thursday after the first Monday in January.

Education.—At last report, there were 1,945 public elementary schools in the state, with 11,629 teachers; 55 junior high schools, with 1,087 teachers; and 860 senior high schools, with 7,701 teachers. Elementary, junior and senior high school students numbered 464,190. Elementary school teachers earned an average yearly salary of \$1.465; junior and senior high school teachers, \$1.745. Teacher training courses are offered at 32 colleges and universities in the state. Education is compulsory for children between the ages of 7 and 16, inclusive.

Finances.—Following is a statement of Indiana's finances for the fiscal year 1944-45, furnished by the state treasurer's office:

Balance in treasury, beginning of fiscal year 1944-45	\$ 74,675,781.89
Receipts, 1944-45	261,190,735.60
Total	\$335,866,517.49
Disbursements, 1944-45	251,441,820.49
Balance, beginning of fiscal year 1945-46	\$ 84,424,697.00

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.)	172,832	176,244	243,376
Oats (1,000 bu.)	39,340	31,400	62,092
Buckwheat (1,000 bu.)	171	150	150
Wheat (1,000 bu.)	27,317	26,488	37,590
Barley (1,000 bu.)	1,025	1,296	1,134
Rye (1,000 bu.)	1,685	1,080	1,330
Hay:			
Alfalfa (1,000 tons)	784	677	851
Clover and timothy (1,000 tons)	1,009	1,348	1,167
Tame (1,000 tons)	2,508	2,577	2,639
Soybeans for beans (1,000 bu.)	11,894	23,150	28,640
Sweet potatoes (1,000 bu.)	287	225	225
Tobacco (1,000 lb.)	8,736	14,324	14,380
Potatoes (1,000 bu.)	5,576	3,115	4,620
Apples (1,000 bu.)	1,531	1,363	920
Peaches (1,000 bu.)	296	674	589
Pears (1,000 bu.)	267	157	146
Grapes (tons)	3,310	2,500	1,500

INDUSTRIAL DESIGN. Industrial design approaches its most magnificent opportunity: to give shape to the reconversion of the world. The postwar era wants to have a face lifting, wants to present a new appearance to the millions. The craftsman for the millions is the industrial designer. He is supposed to fashion the appearance of our cereal box and our perfume container, the form and label of our canned goods and the shape of our airplanes, our refrigerator and automobile, office furniture and

fountain pen, electric iron and toaster, kitchen interior and helicopter, gasoline station and express train and a thousand other things which will surround our lives every day, at home and in the office, while we travel or play golf (after all, he is fashioning golf clubs too).

There are two widely divergent schools of thought as far as the goals of industrial design are concerned, and the very near future will probably decide in which direction it will have to move for a long time. Some hold that industrial design should be mainly cognizant of its social responsibilities as far as the manufacturer and the public is concerned, and for this reason should stress clarity and functionalism, organic thinking and structural development; while others contend that the designer should be no more than a successful salesman, glamorizing products and machines regardless of any other considerations involved. There is great danger that industrial design will tend to follow this second road of great temptation and easy monetary reward, instead of developing a blend of the two schools mentioned. This danger is heightened by the fact that industrial design as such is a young profession, of scarcely more than 20 years of conscious existence and, until very lately it has been practiced by so small a number of people that its canons and ethics, the limits of its field, its practice and goals have not yet been clearly defined. Also there has not been any specific schooling for most of the men calling themselves industrial designers. People of many different backgrounds have drifted into industrial design, for instance: architects, engineers, interior decorators, sculptors, advertising designers, and in designing their products they have generally been influenced by the point of view of their former professions. Few of them have been as yet able to observe and comprehend the manifold and intricate details that should be considered in designing a product that will cost the manufacturer thousands of dollars and possibly will reach millions of customers. Many have lacked modern merchandising or manufacturing experience, and consequently have had to find their way by trial and error alone. Industrial design, on the other hand, has tremendously expanded its demands on the practitioner through the simple fact of reconversion of whole industries so that if the world is not to be flooded with ill-conceived articles, the technical education of industrial designers must be made an important part of postwar curricula. The Carnegie Institute of Technology, early recognizing the importance of instruction in industrial design, established a series of courses and created a Bachelor of Arts degree for industrial designers. Later, Pratt Institute in Brooklyn, N. Y., opened a similar series of courses, as did the Graduate School of Design in California and other institutions. Nevertheless the instruction in this tremendously important field leaves much to be desired. Pratt Institute also invited Alexander Kostellow, the first man to introduce industrial design in an academic curriculum (Carnegie Institute of Technology, 1933), to co-ordinate its courses in order to ensure graduates thorough grounding in their profession.

In 1945, two associations of industrial designers—the American Institute of Designers and the Society of Industrial Designers—undertook to establish the profession in all its legal and official details, and present it to the public as such, a profession rather than a trade.

INFLATION AND PRICE CONTROL. The AMERICAN ANNUAL has contained articles on this subject since the fear of inflation became a major issue in connection with the financing of the war program. The theory and implications of inflation have been covered in these contributions. Likewise, the measures enacted by Congress for price control and stabilization, and the administration thereof, have also been analyzed and appraised. Since there have been no important changes in policy, it will suffice here to record the extension act and its passage through Congress; the price changes during 1945 as compared with those in certain other countries; and the price prospects for the year ahead.

Extension Legislation—Progress Through Senate.—The Senate Banking Committee submitted a report to the Senate recommending the extension of the expiring act without change, save for the substitution of 18 months for the 12 months' life appearing in the measure it was to replace. The six Republicans on the committee brought in a minority report proposing specific amendments, which were introduced in the Senate debate on the bill. The Taft amendment, substituting a six months' term for the 18 months proposed in the majority report, was compromised by agreement on 12 months. Amendments proposed that went to the principle of price control, and their disposition, were as follows:

(1) To forbid the fixing of any price ceiling for "any commodity or the major part of any commodity," if the manufacturer or processor protested that such ceiling would not enable him to realize a profit at least equal to the "dollar margin" which he received during 1941 (Taft, Ohio). This amendment, if enacted into law, would have had the following results: (a) it would have made the high-cost producer the criterion for price ceilings for all producers; and (b) it would have substituted for the "overall" profit theory (that prices are high enough if they yield a profit on the whole business) the theory that each commodity, or part of a commodity, should yield a satisfactory profit on its own account. It failed of passage by a vote of 41 to 26.

(2) To make profit margins mandatory for cotton producers (Thomas, Oklahoma). Like the above amendment, this proposal would have made the high-cost producer the basis for ceiling prices for all producers. It failed of passage.

(3) To make unlawful any price ceilings for any major processed products of agriculture that are not high enough to cover all costs of production plus the profit made in a representative base period (Thomas, Oklahoma). This amendment was lost in favor of a substitute submitted by Senate majority leader, Alben Barkley, calling for reasonable price margins for the processing industry on each species of livestock, rather than on each separate marketable product as would have been required by the Thomas proposal.

(4) To outlaw all price ceilings for farm products unless they covered "all costs and expenses (including all overhead expenses, a return on capital, and an allowance for the labor

of the producer and his family) . . . plus a reasonable profit thereon" (Wherry, Nebraska). The parity principle had raised farm prices from the index of 92 in 1939 to 203 in June 1945, an increase of nearly 121 per cent. The increase proposed by Wherry was to be superimposed upon that guaranteed by the parity formula. The proposal involved insurmountable administrative problems. Furthermore, it involved the application of the "cost-plus" theory of price fixing. This would have encouraged excessive costs as a means of increasing profits.

The Senate approved the above amendment by a vote of 37 to 30. Referring to it, Senator Barkley said: "The Wherry amendment is even worse than the Thomas amendment which was rejected. If anybody for a moment thought it would be adopted if would have been discussed. It seemed so ridiculous that nobody thought it worthwhile to discuss it. It is a more serious inflation threat than either the Thomas or the Taft amendment."

Progress Through House.—There were amendments introduced in the House that were counterparts of those in the Senate. These may be passed over, and attention directed to three amendments that represent departure from the Senate pattern:

(1) An amendment to confer upon the secretary of agriculture unlimited authority to veto any provision of the Price Control Act, or any law, executive order, regulation, order, directive, or any action taken by any other agency regarding any agricultural commodity, or any food product processed from any agricultural product (Andresen, Minn.). This authority transcended that possessed by the president or any administrative agency entrusted with the administration of price control legislation. It was passed by a vote of 145 to 142.

(2) A singular amendment designed to take power from the Office of Price Administration to require textile manufacturers to produce certain low-cost textiles, especially clothes for people in the lower income brackets, was rejected by a close vote, 164 to 160 (Hartley, New Jersey).

(3) Another, to permit persons or firms objecting to any price ceiling to apply to a federal district court for a restraining order to prevent such ceiling from going into effect (Dirksen, Illinois). This amendment would have enabled those affected to bypass judicial procedure set up in previous legislation. The House approved.

The New Control Act.—In conference, most of the inflationary amendments were either stricken out, or modified. The "cost-plus" formula, and the right of appeal to federal district courts, were eliminated. The amendment making the secretary of agriculture the arbiter of food prices, was modified but may still operate as a restraining influence to effective control. As it came out of conference, it does not require the OPA to secure approval of individual cases of increases above existing levels; nor give him authority to veto an executive order of the president, or of the Office of Economic Stabilization, or the price administrator's orders issued before the passage of the act; nor does the authority of the secretary extend to retail prices. The Barkley compromise amendment, basing profit margins on each major species of livestock, instead of on each portion or process, was accepted by the House conferees.

The conference report, amending the provisions of the expiring act as above indicated,

was promptly approved by both houses, and became law with the signature of the president on July 1.

Price Trends.—The trend of prices for 1945, as disclosed by the Bureau of Labor Statistics, must be taken with reservations since the bureau makes no effort to evaluate quality deterioration or the black market. The following table, compiled from figures published by this source, shows price *increases* for different series from Aug. 31, 1944, to Aug. 31, 1945, for the countries indicated:

All-commodity index (percentage)	Farm products (percentage)	Industrial (percentage)	Cost of living (percentage)
United States .1.9	3.2	1.0	2.3
Canada1.9	6.9	0.0	0.8
United Kingdom . . .1.8	1.2 (foods)	2.3	1.4

Price Prospects.—The year ahead will reflect the result of unprecedented buying power in an upward trend of prices. President Truman has stated that "reasonable wage increases" must be granted in many industries. While insisting on the importance of holding down living costs, he appears to favor higher prices if necessary to support higher wages. His statement is somewhat equivocal but it is being interpreted as a major breach in price control.

Secretary of Commerce Henry A. Wallace on November 1 published the conclusions of the division of research of his department. It concludes that industries generally could raise wages 10 per cent in 1946, without raising prices; and that some, like the automobile industry, could increase wages 15 per cent. Wallace bases these conclusions mainly on technological improvements and anticipated volume production. The evidence contained in his preliminary statement is not convincing, but the limits proposed may be regarded as the minimum acceptable without prolonged strikes.

The period of transition from war to peace is most difficult from the standpoint of price control. The demand for goods that have been off the market or available in limited volume for the past four years is expressed in unprecedented cash and war bond accumulations in the hands of the people. Increased wages, which will undoubtedly be forthcoming, will further accentuate demand, and its consequent, rising prices. This acute situation can be alleviated only by the upsurge of production. Whatever retards it, whether strikes, excessive demands on the part of labor or industry, will prolong the period of reconversion and the threat of inflation.

The October *Federal Reserve Bulletin*, organ of the board of governors of the Federal Reserve System, says: ". . . there is danger that in limited areas buyers may attempt to obtain goods by using their funds to bid up prices, or by placing orders in duplicate and triplicate; sellers, too, may be tempted to charge as much as the market will bear, and may thus contribute to inflationary potentialities. If these developments should occur, some of the disorderly price and inventory conditions which followed the First World War would be imminent. In view of these possibilities, it may be essential to retain some measure of control over prices and over spending, such as price ceilings and high level tax rates, until supplies are much more plentiful."

THOMAS L. KIBLER,

Professor of Economics, Ohio State University.

INLAND WATERWAYS CORPORATION. This agency of the federal government operates a system of barge lines on the Mississippi, Missouri, Illinois and Warrior rivers. According to the annual report of John S. Powell, acting chairman of the Advisory Board and acting president of the corporation, on Dec. 31, 1944, it had assets valued at \$24,179,796.67, and its paid-in capital amounted to \$22,362,843.12. The corporation has no funded debt. All current obligations are met when due, and advantage is taken of all cash discounts. This policy effected a saving in 1944 of \$10,617.89. Revenue freight transported in the corporation's own barges in 1944 totaled 2,084,156 tons as compared with 1,932,662 tons in 1943. In addition, the corporation handled on a towage basis for the account of others, including carriers, a total of 404,093 tons of freight in 1944, a decrease of 29,291 tons from the amount similarly handled in 1943. But despite the fact that it handled more freight on its own account and less for others, the corporation, in 1944, had a consolidated operating deficit of its own and that of its wholly-owned subsidiary, the Warrior River Terminal Company, amounting to \$385,545.49 as compared with a consolidated net income in 1943 of \$178,012.08—a shrinkage of \$563,557.57, resulting, it was said, from increased expenses of \$714,057.44, less increased revenues and other income of \$150,499.87, making the net shrinkage the \$563,557.57 above mentioned. The total operating revenues of the corporation in 1944 were \$8,692,687.26 as compared with \$8,300,116.66 in 1943. Operating expenses in 1944 amounted to \$9,156,133.07 as compared with \$8,420,988.47 in 1943. A considerable portion of the increase in operating expenses resulted from wage increases ordered by the War Labor Board. These totaled approximately \$265,000.

INNER MONGOLIA. A region in northern China extending mainly north of the Great Wall, from Manchuria to Sinkiang, its northern boundary (coinciding with the southern boundary of the Mongolian Republic) passing through the Gobi Desert. The prewar population was estimated at 5,000,000, of whom approximately 4,000,000 were Chinese; area during the Japanese occupation, about 200,000 square miles. Wanchuan, in Chahar Province, is a center of railway traffic and of the important caravan routes which traverse the country, other towns being Kweihsui (population est. 1939, 65,000), and Ningsia. The climate of Inner Mongolia is noted for its dryness, and for its extremes of heat and cold. Main grain crops are wheat, oats, millet, and buckwheat, with beans as the chief vegetable. In 1914 Inner Mongolia was reorganized by the newly-established republican government of China into three administrative areas and a military district, and in 1929 into the four provinces of Jehol, Chahar, Suiyan, and Ningsia. Between 1937 and August 1945, Inner Mongolia was controlled by the Japanese, who organized it in 1939 into a puppet state called Meng Chiang (q.v.), part of the eastern portion of Inner Mongolia (Jehol) being joined to the Japanese puppet state of Manchukuo. Inner Mongolia was included by implication in the communiqué of Dec. 1, 1943, following the Cairo Conference, calling for the expulsion of Japan from all territories "which she has taken by violence and greed." The Sino-Soviet agreement of Aug. 14,

1945, provided that the region should be under Chinese control. On October 16 it was reported that an independent government had been established in Inner Mongolia under the auspices of the Chinese Communists. See MONGOLIA.

INSTITUTE OF ARTS AND LETTERS, National. See NATIONAL INSTITUTE OF ARTS AND LETTERS.

INSURANCE. The welcome ending of the wars in Europe and Asia necessarily brought substantial reorientation in the outlook of the insurance industry, as of all others. Various wartime problems were supplanted by the many difficulties of reconversion. Insurance has now become such an integral part of the American economy that even minor changes in the general economic outlook are quickly reflected in its operations. However, the net result has been that in 1945, as in previous years, the insurance industry successfully met its problems and attained new all-time highs—both as to the amount of insurance in force, the percentage of the general population enjoying its protection, and in the volume of premium income and assets.

Assets held and invested for the protection of policyholders and beneficiaries, in every kind of private insurance carrier combined, aggregated well over \$50,000,000,000 at the end of 1945. Premium income ran some 5 per cent of national income, but after allowance for the return flow of cash to policyholders in payment of claims and dividends, and after allowance for the increase of policyholders' equity, the net flow of cash to these institutions from the public remained under 1 per cent of the people's income.

Among the more troublesome problems was the readjustment necessary in some instances because of the 1944 Supreme Court decision in the *South-Eastern Underwriters Association* case, holding insurance to be commerce. An act signed by President Roosevelt on March 9, 1945 extended the time within which states might make any necessary readjustments in their laws, in order to bring them in conformity with this Supreme Court decision; it also granted the companies, with appropriate safeguards for the public welfare, time to make any necessary changes in their business procedures. This extension of time expires on Jan. 1, 1948.

Casualty Insurance and Suretyship.—This branch of the business experienced again in 1945 the almost phenomenal progress that has characterized it for a great many years. Assets of the combined stock and casualty companies rose by some 10 per cent, and premium income was up nearly as favorably.

A few figures will illustrate how great has been the progress of this youthful branch of insurance. In the early 1920's, its annual premium income was hardly one half as large as that of the fire and marine insurance industry. By 1945 it had not only outstripped its older companion but was beginning to move well ahead of it. The increased mechanization and urbanization of American life, as well as wider realization by the public of its great need for casualty insurance protection, help explain this remarkable progress.

The sudden ending of the Second World War at first threatened to produce unusual problems in this field. Curtailed employment and payrolls, with consequent decrease in workmen's

compensation premiums, and the lifting of restrictions on use of gasoline, with possible large increase in automobile liability claims, were among the difficulties on the horizon. After the initial impact, however, these problems proved less serious than at first thought. But federal taxation continues to be a serious matter, and underwriting results are necessarily being watched with great care by company officials.

Of the 1945 premium income totaling \$1,-650,000,000, better than one third was derived from workmen's compensation insurance, and another one third from the various forms of automobile insurance underwritten by casualty insurance companies. A variety of lines made up the balance, with the fast-growing accident and health insurance figuring very prominently among them.

Assets of these companies are now on the road to \$3,500,000,000 in aggregate. United States Treasury securities comprise 55 per cent of the total, compared with 30 per cent in pre-war days. Other bonds figure largely in the remainder, for the casualty insurance companies traditionally have had relatively small proportions of their assets invested in stocks. The importance of stocks as investments for casualty insurance companies has not changed greatly in a good many years; they now comprise well under 20 per cent of assets for the combined companies.

Fire and Marine Insurance.—This branch of the insurance business is a very old and well established one in American life, for there are now nearly 100 American stock or mutual fire insurance companies which have been in successful operation for a century or more. The year brought the industry further substantial growth in its property insurance in force—in considerable degree reflecting increased values incident to rising price levels and to the high level of industrial activity. Aggregate premiums were approximately \$1,550,000,000, some 5 to 10 per cent above 1944. Virtually one half of this premium income received by the property insurance companies was for fire insurance, with the various marine coverages comprising another 20 per cent, motor vehicle insurance another 15 per cent, and miscellaneous coverages making up the balance.

Assets were in excess of \$4,250,000,000—a gain of about 10 per cent for the year. Part of this increase represents the normal growth of the companies, and part is attributable to enhanced values for stocks, which ordinarily comprise some 40 per cent of the assets of the stock fire companies and about 15 per cent of the assets of the mutual ones. Holdings of United States Treasury issues again rose, and these now comprise between 35 per cent and 40 per cent of all assets. This ratio compares with about 20 per cent invested in federal securities prior to the Second World War.

The record as to fire losses continues to be unsatisfactory. Figures compiled by the National Board of Fire Underwriters indicate that fire losses in 1945 were some 10 per cent above 1944 and more than 20 per cent above 1943. Total fire losses in the United States (insured and uninsured) are approaching \$500,000,000—more than one third higher than the average annual loss from 1933 through 1942. In interpreting these figures, one must keep in mind the increased volume of property subject to fire, also the higher current price level than that existing in the 1930's. But more efficient insur-

ance methods, as well as the expanded use of fire-resistant and fire-proof construction continues to bring about a decline in the average premium rate charged per \$100 worth of fire insurance. It is now hardly one half what it was a half-century ago.

War Damage Corporation.—As in the previous year, war risk policies in force March 31, 1945 were automatically extended for another year from their expiry date by the federal-sponsored War Damage Corporation. No additional payment of premium or other action was required by policyholders. The War Damage Corporation began operations on Jan. 1, 1942 with \$100,000,000 capital and with total funds of \$1,000,000,000 available to it from the United States Treasury. Insurance was voluntary; the government-sponsored agency insured the major portion of the risk, while private fire insurance companies underwrote the balance and undertook to place and service the policies. Approximately 635 fire and casualty insurance companies have participated with the government in this co-operative activity. On the 5,000,000 policies written with an in-force of \$150,000,000,000, losses proved to be extremely small. Ultimate disposition of the some \$250,000,000 premium collected is still uncertain.

Hospital and Medical Service Plans.—Accident and health insurance has gained favor with the American public year by year, and this tendency was particularly pronounced in 1945. Aggregate premiums paid for all A and II protection are estimated at nearly \$700,000,000, some 15 per cent higher than in 1944 and more than double the total for the prewar year 1940.

Among the many kinds of accident and health insurance, perhaps the greatest growth of all has been enjoyed by the plans which help cover the cost of hospital expense. These are underwritten both by private insurance carriers and under so-called "Blue Cross" hospital care plans. Nearly all American states are now served by these latter plans and enrolment is now roughly 20,000,000. The whole of this great growth in membership has occurred in a period of barely 10 years, and present enrolment is three times what it was prior to American entrance into the war.

The allied movement, the so-called "Blue Shield" medical service plan, has also been expanding lately. In the first half of 1945 such plans added more members than for the entire year 1944. There are now 25 in operation, covering some 2,000,000 members. Within certain limitations, they help pay the cost of surgeon's fees. Experimentation is also under way whereby medical care in the home or the doctor's office would likewise be provided for, on an insurance basis. INSURANCE.—Life. See **LIFE INSURANCE.**

INTER-AMERICAN AFFAIRS. The outstanding events in relations between the American republics in 1945 were the Inter-American Conference on Problems of War and Peace held in Mexico City, Feb. 21 to March 8, 1945, and the United Nations Conference on International Organization, which met in San Francisco, Calif., April 25 to June 26.

Chapultepec Conference.—The first meeting, popularly called the Chapultepec Conference be-

cause its sessions were held in that historic castle in Mexico City, is considered by students of Pan American affairs to have been one of the most successful of all Inter-American conferences. Facing the lessons of the Second World War when it was demonstrated that the freedom of every American nation depended on the freedom of all the others, the delegates refused to allow divisive questions to stand in the way of marking out a program of hemispheric unity. The feeling that all the American republics form one family was clearly registered in a number of new and fundamental undertakings, in spite of the recognition of many unsolved problems in the Pan American field.

The most important accomplishments were: (1) the adoption of measures tending to assure the protection of American nations from aggression, especially the Act of Chapultepec; (2) the reorganization of the Pan American Union, charging it with new political and economic responsibilities; (3) a hemispheric economic program, which recognizes the interdependence of the United States and Latin American republics in transition from a war to a peace program, and the need for common participation in the industrialization of Latin America and raising the standards of living; (4) an emphasis on social democracy and human rights; and (5) the pattern for co-operation between the American system and a world organization.

Two addresses at the opening of the conference showed how different this meeting was from former ones. The president of the conference, Mexican Foreign Minister Ezequiel Padilla, omitted entirely the customary glorification of Simón Bolívar and other historic heroes, and called for action in the matter of raising the standard of living of the people of the Americas. "What is it that America expects of this conference?" demanded Señor Padilla. "It expects practical resolutions that will alleviate its misery . . . This war is not all destruction, it is also hope. Above all, it is a social revolution, the greatest in the history of the world . . . Here we must dedicate ourselves to the cause of human dignity, as the best tribute to those who have died for it. . . . The Western Hemisphere contains over thirty million square kilometers of frustrated lives. If democracy is not an impostor, it will offer safe, steady work, decent homes for the people, schools, hospitals, and above all, economic security not based on dictatorship and slavery, but on true liberty, fair distribution of goods and social justice for all people." Delegates showed their deep interest in this new Pan American emphasis on raising the standards of the common people by voting to name the idea "the Padilla doctrine."

The next speaker was the new, youthful secretary of state of the United States, Edward R. Stettinius, Jr. He declared that the foreign policy of the United States was: (1) the defeat of the Axis; (2) the elimination of Nazi-Fascist groups in Germany and in Japan, and the prevention of their infiltration into the American Continent (Latin American delegates later tried to get Spanish Falangists named as among the Fascist enemies of democracy, but failed); (3) to make its full contribution to building a world where each nation can develop its own free institutions; (4) the creation of an international organization to insure the peace of the world; and (5) to build a peace "which will afford assurance that all men in all lands may live out their lives in freedom from fear and want." Such declara-

tions the Latin Americans had long desired to hear from their northern neighbor.

Replying to the question that most deeply interested his auditors, Secretary Stettinius declared: "Here in Mexico City we are particularly concerned with the application of this policy to the Western Hemisphere. The United States intends to propose and support measures for closer co-operation among us in public health, nutrition and food supply, labor, education, science, freedom of information, transportation, and in economic development, including industrialization and modernization of agriculture."

Economic Co-Operation.—An Inter-American Economic Charter to define future economic co-operation was adopted. The charter laid down the following principles for collaboration: (1) joint action in the orderly transition of the economic life of the Americas from war to peacetime conditions; (2) sound economic bases for the development of natural resources, increased industrialization, improvement of transportation, modernization of agriculture, development of power facilities, encouragement of investment of private capital, improvement of labor standards and working conditions, including collective bargaining—all leading to a rising standard of living and increased consumption.

An Enlarged Pan American Union.—New duties assigned to the Pan American Union eliminated much of the dominance of the United States and withdrew the old ruling that prevented the discussion of political questions—two limitations that had fundamentally handicapped the usefulness of the union. The president of the union, who hitherto had always been the secretary of state of the United States, is in the future to be elected annually and cannot succeed himself. The union was directed to deal with political questions and all others that affect inter-American understanding. Representatives of Latin American countries on the governing board can no longer be the diplomatic representatives of those republics at Washington, but must be persons chosen *ad hoc* for this special assignment. The Pan American system was tightened by providing for the holding of international conferences of American states every four years and that of the ministers of foreign affairs of the American republics every year. An Economic and Social Council was approved. (This was formally opened on Nov. 15, 1945.) The full reorganization of the union will be consummated at the Ninth International Conference of American States to be held at Bogotá in 1946.

Act of Chapultepec.—The greatest surprise at the Mexico Conference was the proposal by Colombia, Uruguay, and Brazil that the American republics (transforming the old unilateral Monroe Doctrine) agree to move unitedly against an aggressor, whether an American country or an extracontinental power, that might threaten any American republic. The act provides that all American republics agree to unite against such an aggressor in three different ways: (1) by breaking diplomatic relations with the aggressor; (2) by breaking economic relations; (3) by using armed forces of the contracting parties to restrain the aggressor. It was agreed that a special conference should be held in Rio de Janeiro in October 1945, to write a treaty defining these obligations, but the meeting was postponed temporarily because the United States, at this later date, was not willing to meet with the militaristic Argentine government.

The Act of Chapultepec, in anticipation of

the coming meeting of the United Nations, declared that its provisions should be "consistent with the purposes and principles of the general international organization, when formed."

Latin America at the San Francisco Conference.—

The Chapultepec meeting was a practice game where the Americas learned to work together. Personal friendships formed at Chapultepec proved to be important tools in forging links in the chain of world unity a few weeks later. The Latin Americans gave much study to the Dumbarton Oaks proposals. They also went to San Francisco with a background of experience in international organization beginning in 1826 in the Bolivar conference to form an American League of Nations, on through a half century's work in the Pan American Union and active participation in the League of Nations. With this experience they carried four major emphases to the United Nations meeting: (1) democratization of the Dumbarton Oaks proposals; (2) clarification of relations between regional organizations and the world system; (3) recognition of the fundamental importance of raising the standard of living in any successful movement for international peace; (4) greater emphasis on international law, and good faith in settling international disputes.

Contacts were soon made with other delegations and individuals who were interested in these same principles. Co-ordinated efforts were continued throughout the nine weeks' meeting ending in final charter recognition of a number of these questions. The position of Mexico is an illustration. Previous to the San Francisco Conference she had sent a document to Washington suggesting some 20 changes in the Dumbarton Oaks proposals. Fifty per cent of these were finally adopted, the principal ones being as follows: (a) provide that any nation being investigated by the Security Council has a right to be heard at the examination; (b) clarify relation between regional organizations and world organizations; (c) incorporate in the charter a declaration concerning human rights and create an organ to carry out the same; (e) stipulate that a member state accused of aggression shall not have a vote in the decision; (f) suppress all limitations on free discussion of any international controversy; (g) make the Economic and Social Council an essential major organ; (h) provide for the taking over of the activities by the League of Nations and an *ad interim* body to serve between the San Francisco Conference and the first meeting of the new United Nations Assembly.

These proposals, made months in advance, and many written into the charter, represent most of the victories for democratic processes made at San Francisco—due, of course, not to one country, but to the united and ever-insistent drive of many of the "small" and "middle" nations, often accompanied by the displeasure of the Big Five.

The long struggle over the place of regional systems in world organization was one of the most difficult phases of the conference. The friends of Pan Americanism went into the debate in the spirit expressed by President Roosevelt: "We have not labored long and loyally to build a system of security and international co-operation on the American continent only to see it disintegrate. In the system we are creating for the United Nations, the American system has much to contribute."

It sounded strange indeed to delegates from

INTER-AMERICAN AFFAIRS

United States Secretary of State Edward R. Stettinius, Jr., addressing the delegates of the Inter-American Conference in the Chamber of Deputies, in Mexico City.

The Pan American governing board met in extraordinary session, in Washington, D.C., in which they unanimously adopted a resolution enabling Argentina to sign 61 resolutions of the Mexico City Conference. Señor Eduardo Garland, minister of the Peruvian Embassy reads the resolution.

the other Americas to hear a United States delegate, in his enthusiasm for the new world system, say that he would be willing to ignore the Monroe Doctrine and various other things to attain a universal system. They have come out of the war believing that, whether they were entirely agreeable or not, the Latin Americans must stand with the United States to defend the continent. Therefore, they said, let us realistically acknowledge this and write down the rules of this co-operative game. This was done in the Act of Chapultepec in Mexico. It was not necessary to renounce it to succeed in the larger task faced at San Francisco.

All delegations finally accepted this position. "Nothing in this Charter," says Article 52, "precludes the existence of regional arrangements . . . provided that such arrangements are consistent with the Purposes and Principles of the United Nations." Kindred declarations advise the Security Council to encourage regional organizations to settle local disputes. The right of regional organizations to take immediate steps for self-defense against an aggressor is admitted, but such measures must be reported to the Security Council, which retains the right itself to take any additional measures that might seem necessary to restore international peace.

Thus the Pan American System was fully recognized, the action against an aggressor provided in the Act of Chapultepec was indirectly approved, while the overall control of all sections of the world, so far as peace is concerned, was placed finally in the hands of the Security Council. For the first time in history, the conflict between the American and the European systems were co-ordinated.

The skill of Latin American delegates, the only ones who were thoroughly trained in the French theory of international relations, and at the same time could profit from long years of experience in the American system, was well recognized at San Francisco. The important steering committee elected a Latin as its rapporteur. For the four commissions, the Southerners furnished one chairman and two rapporteurs; and for the 12 major committees, they provided five chairmen and five rapporteurs (the latter officers as co-ordinators and reporters of group activities, carried the heaviest committee responsibilities). With 20 votes out of 50, the Latin American delegates had an important part in writing a world charter, which was a great advance over the original proposals and marked the San Francisco meeting as one of the greatest conferences in history.

Argentine Militarism.—Argentina continued to be the divisive force in inter-American affairs during 1945. Because of her militaristic government and her co-operation with Nazi Germany, she was the only American republic not invited to the Mexico Conference, although she still retained her membership in the Pan American Union. On the closing day of that conference, a resolution was passed inviting Argentina to sign the actions taken at the meeting and expressing the hope that the republic "would orient its own policy until it achieved its incorporation in the United Nations." The hard pressed Farrell-Perón dictatorship accepted the terms, declared war on the Axis and applied for membership in the United Nations. This application was supported by the delegations of the United States and the Latin American republics on the ground that hemispheric unity was essential to world unity and that democratic processes could be

more easily restored in Argentina by having her in rather than out of international organization. Against the declared opposition of Russia, Argentina was admitted. This caused a popular protest against what many considered an endorsement of fascism. Unfortunately the militaristic leaders, instead of adopting a more democratic program, redoubled the persecution of their enemies and increased restrictions on liberty.

In the meantime, diplomatic relations between the United States and Argentina were restored and Ambassador Spruille Braden openly attacked the military clique that controlled Argentina. For this he was praised by the democratic forces in that country and was called by his own government to take the place of Nelson Rockefeller, assistant secretary of state in charge of the Division of American Republics. Col. Juan Perón temporarily lost his power, but recaptured it when democratic forces lacked the leadership to follow up their advantage. Argentina illustrates how difficult it is for people who once lose their liberties to recapture them. She is paying the price of refusing to adopt measures to improve the conditions of the common people and of neglecting to take a deep, intelligent interest in the formation of democratic government.

Political Disturbances.—The end of the war brought several more or less violent political changes in Latin America as in other parts of the world. In Brazil, the opponents of President Getúlio Vargas chose the advent of peace as an appropriate time to end his dictatorship, which began in 1930. The armed forces joined in this movement. Six weeks before the time appointed for elections (Dec. 2, 1945) Vargas was compelled to resign. Following the provisions of the constitution, the chief justice of the Supreme Court, Dr. José Linhares, became president and promised free elections. These were held on Dec. 2, 1945 and resulted in the free election of Gen. Eurico Gaspar Dutra as president, and an entirely new Congress.

In Venezuela the elections which were announced by President Isaías Medina Angarita seemed set for the return to power of Gen. Eleazar López Contreras, who became president the first time following the death of Dictator Juan Vicente Gómez in 1935. A group of young army officers revolted under the leadership of Col. Romulo Betancourt, who became president. He announced a program of social reform and continued co-operation with the United States and the United Nations.

Democratic regimes which came into power in 1944 after long dictatorships in Guatemala and El Salvador have had many difficulties but have maintained themselves in power. Peru held free elections in June and inaugurated a new liberal government under President José Luis Bustamante.

Cultural Exchange.—While the United States government suspended during the war its program of sending students to Latin America, it has continued to bring Latin American students, professors, and other visitors to this country. The Office of Inter-American Affairs published the *Register of Visitors from the Other American Republics* every two weeks during 1945. It shows a surprisingly large number of citizens of the southern countries who are constantly traveling in the United States. Distinguished scholars from the United States also have been sent by their government as teachers and lecturers to the other Americas.

In 1945 the Children's Bureau of the United States Department of Labor arranged that specialists in child welfare from Brazil, Colombia, Costa Rica, the Dominican Republic, Ecuador, Nicaragua, Paraguay, Peru and Venezuela should visit the United States for six months. They assembled in Washington for an orientation period of three weeks and then went to specially selected institutions in different parts of the United States for four months' study. They returned to Washington to consult further with the officers of the Children's Bureau and write a report of their experiences before returning home.

Also announcement was made by the Office of Inter-American Affairs that a group of 20 Latin American labor leaders would be invited to the United States to study the relations between employees and management and consult with trade union groups.

Relations between labor leaders in the Americas are becoming more active. The Confederation of Latin American Workers (CTAL) founded in Mexico City in 1938 now has affiliated organizations in 16 republics, totaling some 4,000,000 members. At its meeting in Cali, Colombia, Dec. 10-15, 1944, fraternal delegates were present from the United States, Canada, Great Britain, and the Soviet Union. A number of American republics appointed representatives of labor on their delegations to the Mexico City and San Francisco conferences. Strong delegations were sent by Mexico, Chile, Cuba, Brazil, Argentina, and other republics to the World Trade Union Conference which met in Paris during October 1945. The labor movement in southern countries has usually strongly opposed fascism in centers where reactionary movements have been active.

The United States Department of State recently recognized the importance of labor in international relations by organizing the Division of Labor, Social and Health Affairs. It has employed a staff of specialists in Washington and is sending special labor attachés to various Latin American and European countries. Data will be collected concerning such matters as wages, labor costs, employment, unemployment, cost of living, industrial disputes, labor legislation, economic and political policies of organized labor groups. "In most of the modern industrial nations," says an official of this division, "the labor force has become articulate through its organization. Such organizations exercise a strong and direct influence on governmental economic and political policies."

Organizational Changes in Cultural Exchange.—The year 1945, which marked the close of the Second World War, witnessed a number of shifts in the United States government program for cultural exchange. The Office of the Coordinator of Inter-American Affairs was organized in 1940 and developed an extensive program of educational, health, and social activities in Latin America and the United States. The exchange of students and professors, the promotion of visitation of most of the other groups, and the program of publicity, have been taken over by the Department of State. Nelson Rockefeller resigned as co-ordinator of inter-American affairs and became assistant secretary of state for Latin America, resigning from that office to return to private life in September 1945. Wallace K. Harrison succeeded Mr. Rockefeller as director of the Office of Inter-American Affairs, which continues the health and labor programs carried on in most of the American republics. The speakers bureau and the work of Inter-American centers in the

United States have been turned over to a new private organization, the Council for Inter-American Co-operation in New York City. Since the office of the co-ordinator was a war activity, all of its work will probably be turned over to permanent departments of the government or abandoned.

The Inter-American Educational Foundation, Inc., was established as a permanent organization by the co-ordinator's office on Oct. 14, 1943, with funds granted by Congress. The plans for this foundation have been worked out after many years effort to find how the United States government might acceptably co-operate with other American republics in solving their difficult educational problems. The program involves three major sections: sending United States educators to the other American republics; bringing Latin American educators to this country; and the development of textbooks and other teaching material. Expenses are born jointly, usually in equal proportions by the two governments. Eleven countries—Chile, Peru, Bolivia, Ecuador, Paraguay, Guatemala, Costa Rica, Haiti, Honduras, El Salvador, and Nicaragua—have signed agreements with the foundation and are contributing about 70 per cent of the cost of the program.

The educational emphasis is on the community school idea, to raise the standard of living, develop democratic public opinion, and provide healthy, well-trained workers for the rapidly developing industrial life of these countries. Some 55 Latin American educators, including several ministers of education, have already been brought to the United States and have returned home to work on their new programs. Nearly 100 United States specialists have been sent to participate in the new developments in the southern republics. See also PAN AMERICAN AFFAIRS; WORLD POLITICS.

INTER-AMERICAN HIGHWAY. See HIGHWAYS.

INTERNAL REVENUE, United States. Collections of internal revenue by the government of the United States in the fiscal year ended June 30, 1945, totaled \$43,800,387,575.90, as compared with the 1944 fiscal year collections of \$40,121,760,232.77, an increase of \$3,678,627,343.13. Income taxes (q.v.) accounted for \$23,914,028,755.19 of the 1945 grand total as compared with \$23,545,151,263.30 collected in the 1944 fiscal year. In 1945 liquor taxes accounted for \$2,309,865,790.07 against \$1,618,775,155.93, the 1944 total. Tobacco taxes added \$932,144,822.32 in 1945 as compared with \$988,483,236.89 in 1944. Of the decline in these taxes, \$67,900,237.42 was attributed to the dropping off in the taxes on small cigarettes, due to scarcity. However taxes on large cigars, smoking and chewing tobaccos showed gains. Documentary taxes, that is stamp taxes on deeds, bonds, capital stock, playing cards, etc., totaled \$65,527,514.65 in 1945 against \$50,799,687.27 in 1944. Manufacturers' excise taxes produced \$782,510,639.70 in 1945, as compared with \$503,462,170.36 in 1944. Miscellaneous taxes accounted for \$1,430,476,064.11 in 1945 against \$1,076,921,051.06 in 1944. In the latter category are the taxes on theater and other admissions. These jumped from \$205,289,025.61 in 1944 to \$357,466,115.28 in 1945. Taxes on telephones, telegraph, radio, leased wires, etc., jumped from \$141,275,266.52 in 1944 to \$208,018,146.35 in 1945. Of the total internal revenue collected in

1945, New York accounted for \$8,261,525,191.12; Illinois for \$3,766,335,175.71; California for \$3,722,459,219.40; Pennsylvania for \$3,712,318,581.82; and Ohio for \$3,055,951,071.09. Income taxes withheld at the source in 1945 totaled \$10,264,219,340.18, as against \$7,823,434,977.46 in 1944.

INTERNATIONAL LABOR ORGANIZATION. (ILO). The principal activity of the International Labor Organization during 1945 was the 27th session of the International Labor Conference. Four sessions of the governing body, which functions as an executive committee of the organization, also were held during the year. The 94th session of the governing body took place in London in January. Its chief decisions were to convene the 27th session of the conference to meet in Paris in the autumn, and to fix the agenda of the conference as follows: (1) director's report (social problems of the immediate postwar period with special reference to Europe—future policy and program of the ILO); (2) the maintenance of high levels of employment during the period of industrial rehabilitation and reconversion; (3) welfare of children and young workers (first discussion); (4) matters arising out of the work of the constitutional committee; (5) minimum standards of social policy in dependent territories (supplementary provisions); and (6) reports on the application of conventions (Art. 22 of the constitution). The body also decided to convene a special maritime session of the International Labor Conference in the spring of 1946, and to hold a preparatory technical maritime meeting, for the purpose of drafting proposals for submission to the maritime conference, in November. Among its other decisions were to establish international tripartite industrial committees for seven of the world's chief industries, and to adopt a report of its constitutional committee which affirmed the desire of the organization for association with the general security organization.

At its 95th session, held in June at Quebec, Canada, the governing body fixed October 15 as the date for the opening of the conference, and voted to invite those members of the United Nations which are not members of the organization to be represented at it by observers. Other decisions taken were to convene the third regional conference of American states members of the organization to meet in Mexico City in the spring of 1946; to refer to the 27th session of the conference an application from Italy for readmission to the organization; and to adopt an expenditure budget of 11,521,510 Swiss francs for 1946.

During July the permanent committee of the Inter-American Conference on Social Security, with which the ILO works in concert, met at Mexico City. Meetings were also held in July at London of two special subcommittees dealing with questions on the agenda of the preparatory technical maritime meeting, and of the committee of experts on the application of conventions.

The governing body held its 96th and 97th sessions immediately prior to and following the 27th session of the conference. Two of the international industrial committees—those on coal mining and inland transport—were scheduled to meet in London late in the year.

The extensive program of publications of the International Labor Office was maintained throughout the year. See also **LABOR CONDITIONS IN THE UNITED STATES.**

INTERNATIONAL TYPOGRAPHICAL UNION. Parent body of approximately 900 local unions of printers established in as many cities in the United States and Canada. The organization was officially founded in 1852. The annual report of the secretary-treasurer for the year ended May 20, 1945, showed 80,422 journeyman members and 3,627 apprentice members. Of that number 10,130 were in military or naval service. The financial statement showed that members paid \$704,144.40 as per capita tax, and \$3,431,564.48 as pension and mortuary assessment to the international union. Benefits paid by the international union to members totaled \$4,679,675.86, as follows:

Mortuary benefits	\$ 681,873.89
Old age pensions	3,551,024.37
Maintenance Union Printers' Home	446,777.60
	<hr/> \$4,679,675.86

Interest from reserve fund balances, plus miscellaneous receipts, brought total receipts for the year to \$5,086,993.87. Balances in all funds at the end of the fiscal year totaled \$6,422,696.62. The Union Printers' Home, located at Colorado Springs, Colo., was established in 1892. The mortuary fund was started the same year, and the pension system was adopted in 1908. Headquarters: Typographical Terrace, Indianapolis 6, Ind.

JACK GILL,
Secretary-Treasurer, ITU.

INVENTIONS. The National Inventors Council, organized to get needed assistance from the country's inventive ability, announced its intention of calling inventors' attention to certain lines of immediate and direct interest to the armed services. They have listed more than 200 different devices, gadgets and improvements, mostly of a highly technical nature, some involving technical research and laboratory work in chemistry, electronics and technology. Of these the navy wants 25 problems solved the solutions to be shown in sketches and described in writing.

In May 1945, the Subcommittee on War Mobilization, of which Senator Harley M. Kilgore is chairman, presented to Congress the results of a thorough study of recent industrial and inventive progress, for the benefit of the government and of business men. There are listed 1,400 different items in a 400-page report entitled *Wartime Technological Developments*. Many of these items can be applied to peacetime purposes immediately after the end of the war, while others will require continued research to develop them further. The object of the report is to encourage the adaptation and application of wartime techniques and inventions to peacetime industries so that industry may benefit from them, and also to encourage the production of new and improved products at lower costs. Most of these are minor improvements and developments, and include a number of new methods of saving or making use of waste products.

One thing that is attracting increasing comment today is the decline in the number of patents issued. Patents issued in the past have been taken as an indication of the extent and progress of invention. Since 1885, American patents issued have increased only in proportion

tion to the increase in population, but since the last depression there has been a sharp decline in spite of the enormous increase in technical schools, engineers and skilled workers. A similar decline has taken place in Europe in the same period. There seems to be a falling off, or at least no increase, in basic or revolutionary inventions, such as we associate with Morse, Bell, Edison, DeForest, Sperry and the like outstanding inventors. Scientific research has increased to an enormous extent, and has resulted in a vast number of improvements and the cheapening of almost every kind of manufactured product. The research chemists and physicists of industrial corporation's laboratories are producing more new products and are making more improvements every year. Many of these may not be considered patentable, and what is more significant, the value of patents may not be considered so great as formerly. One of the chief factors in the decline of the number of patents issued is the strict scrutiny that applications are now subject to. Also a patent is legally worth little until it has been upheld by the higher courts, and the inventor receives little more benefit than the right to sue. Since 1880 the Supreme Court has invalidated about 65 per cent of the patents that have come before it, many of which covered important inventions. The history of most outstanding inventions in the past is to a large extent the story of the inventor spending much or most of his profits suing for infringements.

Gas Turbines and Jet Propulsion.—One of the outstanding developments that has come out of the war is the invention of the gas turbine and jet propulsion, which are promised to be the basis of a whole new aviation industry, to be swiftly adapted to civil aviation. It is also predicted that side developments will follow, such as new methods of air conditioning of aircraft out of the power available from a turbojet system, giving light, heat and refrigeration, all in one package of reasonably small size. Another speculation is concerning the adaption of the gas turbine or turbojet system to motor cars, in place of the present internal combustion motor.

Turbine-operated locomotives have been the subject of experimental research for several years. The Westinghouse Electric and Manufacturing Company (now the Westinghouse Electric Corporation) and the Baldwin Locomotive Company, in collaboration with the Pennsylvania Railroad, have built a revolutionary type of steam turbine-powered locomotive. The turbine is directly connected to the driving wheels through a train of gears, eliminating the reciprocating parts common to the usual steam locomotive. The boiler is designed to use powdered coal for fuel to give further economies in addition to those effected by the steam turbine. This locomotive was completed at the end of 1944 and put into experimental service.

Following this, nine railroads, including four of the largest systems in the country, have joined forces to spend \$1,500,000 in developing the steam turbine-powered locomotive still further by substituting a turboelectric drive in place of gear connection between turbine and drive wheels, giving the same advantages possessed by the Diesel-electric drive, but retaining the economies derived from using powdered coal. The use of the turbine instead of the reciprocating engines not only increases tractive power but gives a smoothness of running at high speeds of 100 miles per hour or more.

A still further advance is being experimented with by the Westinghouse Electric Corporation which has been working on a gas turbine it plans first to apply to locomotives, and then to develop for aircraft, ships, industrial power and finally electric power generating. If successful, the substitution of the gas turbine for the steam turbine would do away with the steam boiler and further simplify the locomotive.

Air Propeller Boat.—From Paris, France, comes the report that an Englishman, Christopher Hook, has invented a new kind of high speed boat driven by an air propeller, which, when at full speed, lifts above the surface of the water, being supported by a number of flat blades or fins extending below the bottom of the hull, that cause it to skim over the surface. This is an improvement over one of Alexander Graham Bell's little remembered inventions. Bell called his boat a "hydrodrome" which he tried out in 1919 and achieved a speed of 70 miles per hour. The drawback in Bell's "hydrodrome" was that it cut through the tops of high waves or swells, and was not seaworthy. Bell died in 1922 and his project was not carried to a conclusion, in spite of the efficiency and high speed attained. Hook's improvement consists of two appendages extending out in front of the boat that cause it to follow the surface of the water by changing the pitch of the supporting blades under the hull. This causes the boat to climb up and over the swells instead of cutting through the tops of the swells. The British government, after ignoring Hook's approaches during the war, is now said to be investigating the possibilities of the improved craft, since it was discovered that one of Adolf Hitler's secret experimental weapons, the V-6, was an improved type of Bell's "hydrodrome".

Autogiro Improvements.—In August of 1945 four patents, carrying 212 claims, were granted on autogiro improvements. These were assigned to the Autogiro Company of America. In general these patents cover improvements in the positioning and pitch control of the autogiro's rotor blades to give a greater degree of control in flight. The rotor of the autogiro is not actuated by a motor, but its lifting power comes from being pulled through the air by a motor driven propeller in front of the fuselage. This movement sets up rotation in the rotor which exerts lifting power. The patent claims allowed had been held up for ten years, which greatly delayed progress in this type of aircraft. In the meantime, progress has been made on the helicopter, which is different from the autogiro. Its rotor is driven directly by a motor and it is both lifted and propelled by being tilted in the required direction. When only one rotor is used, a small tail propeller is employed to prevent torque, but in the latest types of helicopter, the tail-propeller is not necessary. Instead, there are two rotors turning in opposite directions.

E. C. McDOWELL,
Consulting Engineer, New York.

IOWA. West North Central state, United States; admitted to the Union Dec. 28, 1846. Population (1940): rural, 1,454,037; urban, 1,084,231; total, 2,538,268. Land area, 55,986 square miles, divided into 99 counties. Principal cities, with 1940 populations: Des Moines, the capital, 159,819; Sioux City, 82,364; Davenport, 66,039; Cedar Rapids, 62,120; Waterloo, 51,743; Dubuque, 43,892; Council Bluffs, 41,439.

Chief State Officers, 1945.—Governor, Robert D. Blue; lieutenant governor, K. A. Evans; secretary of state, Wayne M. Ropes; treasurer, J. M. Grimes; comptroller, C. Fred Porter; attorney general, John M. Rankin.

Judiciary.—Chief justice of Iowa's Supreme Court, Oscar Hale; associate justices, William L. Bliss; T. G. Garfield, H. J. Mantz, Frederic M. Miller, John E. Mulroney, Ralph A. Oliver, W. A. Smith, C. F. Wennerstrum.

Legislature.—Iowa's General Assembly (House of Representatives, 108 members; Senate, 50) convenes biennially in odd years, on the second Monday in January.

Education.—At last report, there were 9,395 elementary schools in the state, enrolling 352,168 pupils. Public high schools numbered 1,000, 69 of which were junior high schools; junior and senior high schools had a total enrollment of 126,475 students. Elementary, junior and senior high school teachers earned an average yearly salary of \$1,172. Teacher training courses were offered in 94 normal training high schools; 28 private senior or junior colleges; 3 public junior colleges; and 3 state-supported institutions. The following received financial aid from the state: Iowa State College, Ames; State University of Iowa, Iowa City; and Iowa State Teachers College, Cedar Falls. Education is compulsory for children between the ages of 7 and 16, inclusive.

Finances.—The following statement of Iowa's finances for the biennium July 1, 1942–June 30, 1944, was supplied by the state treasurer's office:

Balance, July 1, 1942.....	\$ 72,477,194.12
Receipts and credits, 1942–44.....	1,255,581,764.55
Total	\$1,328,058,958.67
Disbursements, 1942–44	1,214,723,908.91
Balance, June 30, 1944.....	\$ 113,335,049.76

Agriculture.—The yield of the leading crops of the state in 1944, with 1934–43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following tables:

CROP (and unit of production)	PRODUCTION		
	Average 1934–43	Final 1944	Preliminary 1945
Corn (1,000 bu.)....	436,342	607,608	529,296
Oats (1,000 bu.)....	182,260	144,270	222,794
Buckwheat (1,000 bu.)....	63	210	148
Wheat (1,000 bu.)....	6,598	2,248	2,721
Barley (1,000 bu.)....	8,979	259	84
Rye (1,000 bu.)....	1,170	150	86
Flaxseed (1,000 bu.)....	1,525	656	1,326
Hay:			
Alfalfa (1,000 tons)....	1,940	2,041	1,960
Clover and timothy (1,000 tons)....	1,969	3,238	3,381
Tame (1,000 tons)....	4,952	5,528	5,568
Wild (1,000 tons)....	156	148	131
Soybeans for beans (1,000 bu.)....	13,783	42,580	36,195
Sweet potatoes (1,000 bu.)....	204	200	250
Potatoes (1,000 bu.)....	5,505	2,470	4,320
Apples (1,000 bu.)....	253	80	52
Peaches (1,000 bu.)....	77	20	40
Pears (1,000 bu.)....	104	55	58
Grapes (tons)	3,340	3,100	3,000

IRAN, ê-rân', (PERSIA). A constitutional monarchy in southwestern Asia, bounded north by the USSR and the Caspian Sea; west by Iraq and Turkey; south by the Gulf of Oman and the Persian Gulf; east by Afghanistan and British Baluchistan; area, about 628,000 square miles; population (estimated) between 10,000,000 and 18,000,000, including 3,000,000 nomads. Since Sept. 20, 1941, following the accession of the former Crown Prince Mohammed Riza Pahlevi, the shah's Cabinet has been responsible to the elected Majlis (national assembly) of 136 members.

The country is divided into 10 major administrative provinces, and these into 49 minor prov-

inces, which are further divided and subdivided, the final division being the village or group of villages, or the city. Officials of all these administrative units are appointed through the central government. The capital is Teheran (Teheran, population with surrounding district in 1940, 540,087). Other important centers are Tabriz (214,000), Isfahan (205,000), Meshed (176,000), Shiraz (129,000), Resht (122,000), Hamadan (104,000), and Kermanshah (89,000). Iran, placed under joint British-Soviet control in 1941, signed on Jan. 29, 1942, a treaty of alliance with Great Britain and the Soviet Union, under which the two latter powers undertook to respect Iran's territorial integrity, sovereignty, and independence. Iran declared war against Germany on Sept. 9, 1943, and five days later became a signatory to the United Nations Declaration. From November 26 to December 1 of the same year, Teheran, capital of Iran, was the scene of the historic conference in which the Allies worked out their unified plan for carrying the Second World War to its victorious conclusion.

Iran's international importance is due especially to its geographical position—commanding the western land approaches to India and the Soviet Union's access to the Indian Ocean—and to its rich mineral resources, particularly oil. Internally, a national plan has been under way for some years in Iran, aimed at making the country economically self-sufficient, particularly by improving agriculture and by promoting old and new industries.

Religion and Education.—The official religion is Moslem of the Shi'a sect, and more than one half of the inhabitants adhere to this faith; 850,000 are of the Sunni sect; and there are 10,000 Parsis, 50,000 Armenians, 30,000 Nestorians, and 40,000 Jews. As a result of the increased power of the centralized government, the official power of the priesthood has disappeared, all shrine and mosque endowments being administered by the ministry of public instruction and devoted to charitable institutions under its supervision.

Education has made marked progress since the establishment of a modern system which superseded the old religious instruction. The government pays the entire cost of government schools and makes grants to public, private, and foreign schools. Religious schools are maintained from endowments, but most of the foreign schools which had been conducted by various missionary societies have been taken over by the ministry of education, or closed. Iraq and the USSR conduct primary schools for children of their respective nationalities. The Iranian University at Teheran, established under government auspices, provides courses in medicine, science, preparation of teachers, and other fields of specialization.

Defense.—All services were reported in 1945 as undergoing reorganization in personnel and material equipment, no report being available as to numbers and matériel provided for on the new basis.

Agriculture and Industry.—Iran's principal grain crops are wheat, barley, rice, millet, and maize; its vegetables, peas, beans, and lentils; its fruits, grapes, oranges and lemons, apricots and pomegranates. Poppies are grown for the production of opium, and wool from Iranian sheep figures largely in the manufacture of the famous Persian carpets. The program for improving agriculture includes the installation of irrigation facilities, plants for the preparation of fertilizers, storage buildings, experimental stations, and the planting of many trees, of which there had been very few in Iran.

New crops (such as tea and tobacco) have been introduced, and the silk and cotton industries encouraged. Hand weaving of rugs and carpets continues along with Iran's other typical handicrafts, including pottery, wood carving, and embroidery, and with such new factory industries as canning, sugar refining, spinning and weaving, and the manufacture of cement, cigarettes, chemicals, glass, paper, and shoes. Heavy industry, confined mainly to a few plants for the processing of iron and steel, repair of locomotives and machinery, and war materials, is largely controlled by the government.

Minerals.—Oil, in which Iran ranks fourth among the world's greatest producing countries, is the leading mineral resource, a crucial source of government revenue, and the principal medium for international bargaining, economic and political. Great Britain, with its concession covering a large part of southern Iran, has been the leading recipient of Iranian oil. During 1942–43 shipments amounted to a total of 8,877,766 tons. The chief oilfields are located in the southwest, with a huge refinery at Abadan. Apart from oil, Iran's rich mineral resources, including coal, chromite, copper, arsenic, lead, manganese, cobalt, nickel, and tin, as well as sulphur, sodium salts, and rock salt, borax and marble, have remained largely undeveloped.

Trade.—During the year ended March 20, 1943, the value of the principal dutiable imports was 1,026,000,000 rials, that of the main exports (other than oil exports) was 461,821,000 rials. (The rial equals about three cents in U.S. currency.) Nondutiable imports for the same period were valued at 1,080,241,640 rials, of which goods imported by the Anglo-Iranian Oil Company amounted to 1,074,862,720 rials. In line with the national plan which aims to balance exports with imports, foreign trade is regulated according to a permit system. Wheat and barley, formerly important exports, have been made government monopolies, in which foreign private trading is no longer permitted. The government also exercises a monopoly in the sale of other commodities, including sugar, tea, matches and opium, and over various imports, including cereals, cotton goods, automobiles, tea, sugar, and chemicals. Most of the cotton and wool as well as the principal foods—grains, fruits and nuts (raisins and almonds, for example), and tobacco—were in 1945 being consumed domestically.

Finances.—The total budget (ordinary and extraordinary) for 1944–45 provided for revenues of 10,325,000,000 rials, and expenditures of 10,324,000,000 rials, as compared with 1943–44 revenues of 7,676,710,000 rials and expenditures of 9,194,398 rials (rial = approx. 3 cents in U.S. currency).

Communications.—Railway lines reported in operation in 1945 (including the trans-Iranian railway linking the Persian Gulf with the Caspian Sea at Bandar Shah by way of Teheran, the capital) had a total mileage of 1,181, with additional lines under construction. The 685-mile section of the Iranian state railway from the Persian Gulf to Teheran was used from December 1942 until July 1945 for the transport of lend-lease supplies to the Soviet Union. During the period of its operation by the United States Army, the line's rolling stock was increased to the extent of 180 locomotives and 5,175 freight-cars, brought in under lend-lease. The government program of road construction and improvement was being continued in 1945. In addition to an extensive telegraph system, mainly

state operated, government wireless stations are maintained at Teheran and nine other important centers, and Teheran is in direct wireless contact with Europe through Tiflis and Beyrouth. Air services connect Teheran with Europe and Moscow.

Principal Events.—Iran declared war against Japan on March 1, 1945, and in April and May participated in the San Francisco Conference. On May 31 it was announced that the Iranian government had demanded that the United States, Britain, and the USSR withdraw their troops from the country. According to the treaty of Jan. 29, 1942, between Iran, Britain, and the Soviet Union, the two Allies were to withdraw their forces from Iran within six months of the end of the war against Germany "and her associates," (The New York Times, May 31, 1945) presumably including Japan. On May 31, 1945, while the war with Japan was still proceeding, the Iranian government asked for the immediate withdrawal of the Allied troops. On July 10 the United States Army announced that it had returned the Persian Gulf-Teheran section of the state railroad to the British, who had passed it back to the Iranian government. The British expressed the view that Allied troops were no longer necessary following the German collapse. This view was not accepted by the Soviet government, whose unofficial spokesmen had complained, late in 1944 and in April 1945, of what they considered unfriendly acts on the part of the Iranian government toward the USSR. On August 8 it was announced that British and Soviet troops would be withdrawn from Teheran, and on October 22, Foreign Minister Anushirawan Sepahbodi announced to the Majlis that all Allied troops were to be withdrawn from the whole of Iran by March 2, 1946.

Throughout much of the year Iran's internal politics were marked by tension between the conservative National Will Party, and various parties of reform. Most prominent of these latter was the Tudeh (the party of the masses), with its program of land distribution and complete political freedom for the peasants, free compulsory education, economic equality of women, and friendly relations with all the Allies. All parties supported the principle of maintaining the economic as well as the political independence of Iran. But the Tudeh Party favored the extension of concessions which would benefit the general population of the country, including oil concessions to the Soviet government, which had been refused in 1944 by the government of Iran. The tension between the parties brought about several changes of ministries during the year, and led to the voicing (at the Council of Foreign Ministers in London) of opposition demands for the end of alleged persecution of groups urging democratic reforms. On October 11 (1945) the Majlis passed a resolution deferring the projected elections until the departure of the Allied occupation troops; and on October 22, Premier Muhsin Sadr, who had held office since June 7, resigned, continuing in office, however, on the shah's request, pending the formation of a new government. On November 16, a revolt began in Soviet-occupied Azerbaijan Province, in northwestern Iran, the insurgents forming (at Tabriz, on November 20) a "National Congress" of Azerbaijan, and demanding that the province become an autonomous unit within the Iranian state. The revolt occasioned an interchange of notes between the governments of Great Britain and the United States on the one hand and the

Soviet Union on the other, and as one of the problems remaining unsolved after the Moscow conference of December (1945), was expected to become a subject for study and discussion at the January meeting of the United Nations Assembly in London.

IRAQ (MESOPOTAMIA). A constitutional monarchy in Asia, situated in the lower valley of the Tigris and Euphrates rivers, and extending from the Kurdish mountains of Turkey in the north, to the head of the Persian Gulf in the south, with Iran to the east, and the North Arabian and Syrian deserts to the southwest and west. It has an area of 143,000 square miles and a population exceeding 5,000,000. Formerly a part of the Ottoman Empire, it was recognized as an independent state by the Treaty of Lausanne and placed under mandate to Great Britain. On Aug. 23, 1921, the Emir Faisal was proclaimed king after a plebiscite, and, according to the organic law passed in 1924, the monarchy is hereditary in his family. The reigning king is Faisal II, who succeeded his father, Ghazi, second king of Iraq, on April 4, 1939. The regent and crown prince is Prince Abdul Ilah, uncle of the king. The capital is Baghdad (pop. 1945 est. 550,000). Parliament is composed of two bodies, the Chamber of Deputies, now comprising 120 members, and the Senate, whose members are nominated by the king; the number of senators is limited to one quarter of the number of deputies. In 1932 Iraq was freed from all mandatory control through admission to the League of Nations. British forces invaded Iraq in May 1941, following a coup d'état by pro-Axis Rashid Ali Beg Gailani, and were in control of the country by June 1. Iraq declared war on the Axis on Jan. 16, 1943.

Religion and Education.—Of the total population there are 4,489,540 Moslems, 114,720 Christians, 105,000 Jews, and 50,000 adherents of other religions.

Education is free and nominally compulsory. Arabic is the language of instruction. Kurdish is taught in the elementary grades of schools in districts where the 750,000 Kurds form a substantial part of the local population. There are 833 state primary and elementary schools with 87,261 pupils, 42 private and foreign schools with 22,121 students, 45 intermediate schools with 8,933 students, 15 secondary schools with 2,258 students. In addition there are two boys' technical schools with 291 students, two home-arts schools for girls with 248 students, one public-health school, one school for nurses and four training colleges for teachers. There is no university, but there is a college of medicine, a college of pharmacy, a college of law, an engineering college, a military college, a military secondary school, and a higher institute for training teachers.

Finances.—Receipts for the year ended March 31, 1945, were 23,767,070 Iraqi dinars (1 Iraqi dinar = approximately \$0.04 U.S. currency), as compared with 16,227,666 Iraqi dinars for 1944 and 12,004,366 Iraqi dinars for 1943. Expenditures for the same period were 22,044,620 Iraqi dinars, while the expenditures of 1943 and 1944 were likewise somewhat less than the receipts for those years. Capital works revenue and expenditures were included for the first time in the regular budget in 1944, and amounted to 3,642,608 and 1,189,582 Iraqi dinars respectively.

Agriculture.—Hills and mountains rise in the north and northeast of Iraq, while elsewhere the

land is level, desertlike during the long, hot, dry summers, and blooming when watered by rain or irrigation. Predominantly agricultural, only a small fraction of the area is under cultivation, this mainly through irrigation. The chief crops are wheat, barley, rice, dates, Indian corn, cotton, and tobacco.

Export of dates normally totals 80 per cent of the entire amount produced in the world, and it constitutes Iraq's second largest export. About 15 per cent of the quantity exported comes to the United States. In 1940, 23,084 tons of dates were exported to the United States, but the following year only 413 tons were shipped. War conditions prevented further exportation until the latter part of 1945 when it was estimated (September) that shipments of dates to the United States for the year would total 25,000 tons.

Iraq experienced the most favorable agricultural season in 1943 since the outbreak of the First World War, unofficial estimates of grain production running as follows: wheat, 540,000 metric tons; barley, 750,000 tons; rice, 280,000 tons; millet (including both giant and ordinary), 50,000 tons. In the year ended Aug. 31, 1943, Iraq produced 4,037 bales of lint cotton (787,928 kilograms). The tobacco crop for 1943, 60,000 bales (of 50 to 60 kilograms each), was slightly larger than for 1942.

Petroleum.—Though Iraq is predominantly agricultural, its wealth is only partially dependent on agriculture, since there are oil fields which have been leased to foreign companies and from which the government derives a large revenue. Oil production reached 4,295,126 tons in 1939 and fell to 2,495,728 tons in 1940. Output in 1942 was 18,784,600 barrels, and in 1943 the production of 24,536,600 barrels exceeded that of any year since the outbreak of the war. More than five sixths of the 1943 production was accounted for by the internationally owned Iraq Petroleum Company which operates the Kirkuk fields. Iraq oil is conveyed by pipeline to port refineries located in French controlled Tripoli (Lebanon) and British controlled Haifa (Palestine). Commercial rivalry between the two powers caused serious diplomatic exchanges in 1944 and 1945, the French accusing the English of having secretly supported the Lebanese and Syrian national movements with war munitions and money in order to deprive France of her share of Iraq oil. The Haifa refineries are being considerably expanded. In June 1945 preliminary engineering was begun for a new 16-inch pipeline from Kirkuk to Haifa. When the line is completed early in 1948 it is expected to have an initial annual capacity of 23,000,000 barrels.

Industry and Economic Status.—Compared with the agricultural, pastoral, and oil resources of Iraq, industry is of relatively minor importance. Manufactures include cigarettes, soap, textiles, matches, mirrors, buttons, combs, and alimentary pastes, bricks, tiles, and copper utensils. Iraq's three woolen mills operated at full capacity during 1944, and thousands of hand looms contributed to the total output of between 200,000 and 250,000 yards of woolen textiles. Three cotton gins process the country's cotton crop which amounted in 1944 to 1,080 metric tons. The 1944 crop was less than one fourth of the 1940 yield, due to diversion of effort to growing more cereals. In 1944 the first modern glass factory was established. Approximately 160 tons of goat hair and from 20 to 40 tons of mohair represent the annual yield from goat flocks estimated to number 2,800,000.

Transportation.—Basra (pop. 286,312) is the chief seaport of Iraq, situated 70 miles up the Shatt al Arab at the head of the Persian Gulf. The Tigris is navigable to Baghdad and beyond. Rail routes now follow the rivers, the total length being about 964 miles. Nearly 4,000 miles of roads have been opened for the passage of all kinds of traffic. There are 156 post and telegraph offices. Mail and passenger air service is normally maintained with the European Continent. There are normally several air mail dispatches to Europe each week. Train service on the Baghdad Railway between Baghdad and Haidar Pasha was begun on July 18, 1937. Three services a week operate between Baghdad and the Bosphorus, three days being required for the trip. The route is as follows: Baghdad, Baiji, Mosul, Tel Kotchek, Nisibin, Aleppo, Adana, Ankara, and Haidar Pasha. Iraq's three principal cities—Basra, Baghdad, and Mosul—being thereby linked by rail. During 1944 the Iraqi State Railways also operated a narrow-gauge line from Kirkuk in the north to Basra in the south. About 6,835 motor vehicles were in operation, including 2,114 trucks, 1,020 busses, 1,232 taxis and 2,469 private and government cars.

Foreign Trade.—Iraq's Asiatic trade almost equals that with Europe. The character of trade with the two areas diverges widely, however. Europe takes the bulk of Iraq's output of grains, hides, and skins, and supplies most of the metal manufactures and machinery; whereas Asia purchases a good proportion of dates and cotton, and furnishes chiefly textiles, tea, sugar and timber. Most of the raw wool, and sausage casings, and a high percentage of dates, go to the United States, Iraq's main supplier of automobiles.

Total imports in 1943 amounted to 17,909,763 Iraqi dinars, while total exports (excluding petroleum) amounted to 7,970,197 Iraqi dinars. Transit trade in 1943 amounted to 603,449 Iraqi dinars. Large imports are tea, sugar, textiles, iron and steel manufactures, and in normal times automobiles, tires and accessories. Main exports are oil, dates, cattle and sheep, fish, sausage casings, grain, raw cotton, and wool.

Principal Events.—On March 22, 1945 Iraq delegates were among the signatories of the Arab League (q.v.). The League came into being a year after Iraq had protested against a resolution introduced in the United States Senate by Senator Wagner of New York, calling for American approval of Palestine as a Jewish national homeland; the Iraq protest stated that if the resolution were adopted it would be "tantamount to the United States declaring war on the Arabs." Consequently the resolution was killed in committee. Iraq was among the 46 nations represented at the first meeting of the San Francisco Conference in April 1945. The following month Prince Abdul Ilah, the crown prince and regent of Iraq, paid a state visit to the United States and was the guest of President Truman at the White House on May 28.

IRELAND. The most westerly island of the European continent, Ireland has an area of 31,838 square miles (Eire, 26,601 square miles; Northern Ireland, 5,237 square miles). The population of Eire, December 1943, was 2,949,713; that of Northern Ireland, 1937, 1,279,745. Archaeological remains show that Ireland was inhabited by a well-organized and cultured community centuries before Christ. The country was divided into a number of kingships under an Ard-Ri or high king whose seat was at Tara.

Christianized without bloodshed, mainly by St. Patrick in the 5th century, Ireland reached her golden age of artistic and scholastic achievement in the 7th, 8th, and 9th centuries. Having successfully resisted subjugation by the Norsemen, it was incorporated—after a struggle of centuries—under the English crown. Insurrections in the 17th, 18th and 19th centuries failed but in 1921 a treaty was signed between Great Britain and Ireland by which 26 counties of Ireland accepted dominion status for the time being under the name of the Irish Free States. A separate Parliament for the remaining 6 counties (known as Northern Ireland) had been set up under the Government of Ireland Act, 1920. The government of that part of Ireland formerly known as the Irish Free State is today based on the constitution enacted by a plebiscite of the people in 1937 which restores the former name of Ireland (Eire) and declares that Ireland is a sovereign, independent, democratic state.

EIRE

The Constitution of Eire, operative since 1937, declares that Ireland is a sovereign, independent, democratic state and affirms the right of the Irish people to choose their own form of government, to determine their country's relations with other nations, and to develop its life—political, economic and cultural—in accordance with its own genius and traditions. The Irish language is the first official language, with English recognized as a second official language. The constitution applies to the whole of Ireland but it provides that, pending the reintegration of the national territory and without prejudice to the right of the Parliament and government established by the constitution to exercise jurisdiction over the whole of that territory, the application of the laws enacted by that Parliament shall have the same area and extent of application as those of the Irish Free State which did not include six of the nine counties of the province of Ulster known as Northern Ireland.

Religion and Education.—Catholicism is the predominant religion in Eire, the census of 1936 listing 2,773,920 Catholics, 145,030 Protestant Episcopalians, 28,067 Presbyterians, 9,649 Methodists, and 11,754 others. Free elementary education is provided in the national schools, in which the Irish language has been a required subject since 1942. Latest figures available in November 1945 gave the average daily attendance as 459,984. Estimated state expenditure for elementary schools for 1944-45 (apart from administration) was £4,063,039. Recognized secondary schools, conducted under private control (many under church auspices) receive state grants subject to a system of inspection. In 1942-43 the number of pupils (of ages between 12 and 20) attending these schools was 39,787, the estimated total state expenditure, apart from administration, being £568,030. Technical schools, and agricultural schools and classes established by various local authorities, or by the Department of Agriculture, are partly financed by the state and partly from local taxes. University education (including higher education in agriculture) is provided at Trinity College, Dublin (founded in 1591) and at the National University of Ireland (founded in 1909), with its three colleges, located in Dublin, Cork, and Galway; the total number of university students in 1944-45 was 6,150.

Finances.—Estimated total revenues for 1944-45 were listed at £45,780,000; estimated

total expenditures at £50,224,000. The currency unit is the Irish pound, with the same value as the pound sterling (equivalent in November 1945 to approximately \$4.03½ in the New York market).

Principal Events.—The outstanding political event in Eire in 1945 was the presidential election (June 14). Under the constitution which came into operation Dec. 29, 1937, having been made law by national plebiscite, the Oireachtas, or Parliament, is made up of the president and two houses: the Dail composed of 138 representatives, popularly elected by adult suffrage under the Proportional Representation system, and the Senate of 60 members, partly chosen by an electoral college and partly nominated. The first president was Dr. Douglas Hyde, noted Gaelic scholar, who, chosen unanimously in 1938 and installed in June of that year, retired at the end of June 1945, the presidential term of office being seven years. As there was no agreed candidate on this occasion, an election took place. The two main parties, Fianna Fail, or Government Party (with 76 seats in the Dail) and Fine Gael, or Chief Opposition Party (with 29 seats in the Dail) put forward nominees, Sean T. O'Kelly (F.F.) and Gen. Sean MacEoin (F.G.). Dr. Patrick McCartan was nominated as an Independent. All three had taken part in the Irish War of Independence (1916-21) in consequence of which three fourths of the nation had eventually been liberated. Polling was on June 14. The result of the first count was: O'Kelly 537,965; MacEoin 335,539; McCartan 212,791. Under the Proportional Representation system, McCartan was eliminated and his transferable votes were distributed, when the final figures were: O'Kelly 565,165; MacEoin 453,425. President O'Kelly was installed in office June 25. On July 17 this popular election of a president was cited by the Taoiseach, or prime minister (de Valera) in an important debate in the Dail as one of the signs of the country's constitutional status. He referred to the constitution which declared Eire a sovereign, independent, democratic state, asserted that all power was derived from the people and provided for an elected president as head of the state. He concluded that Eire was an independent republic associated as a matter of external policy with the states of the British Commonwealth.

On the same day as the presidential election, the elections for corporations, county councils, and other local governing bodies took place throughout the state. The principal feature of the results was an all-round gain in seats by the Fianna Fail.

The second important political event of 1945 was the broadcast by Prime Minister Winston Churchill on V-E Day containing a reference to Eire which was deeply resented by the Irish people. Mr. de Valera's reply aroused the greatest interest. Among other things he expressed surprise that Mr. Churchill did not understand why Ireland, whose national territory Britain had partitioned in 1920, was neutral in the war. Then he asked the British prime minister a hypothetical question: whether, if Britain had been invaded by a greater power and eventually had wrested most of her territory free but saw six counties still occupied, would she join that greater power in a war for liberty while part of her own territory remained in subjection? "Would he think the people of partitioned England an object of shame if they stood neutral in such circumstances?" asked Mr. de Valera. "I

do not think Mr. Churchill would." Ending his broadcast, Mr. de Valera said: "Even as a partitioned small nation we shall go on and strive to play our part in the world, continuing unswervingly to work for the cause of true freedom and for peace and understanding among the nations."

Eire occupies a key position in air traffic, and since before the war the airport at Foynes on the Shannon and the land base of Rineanna close by have together been a terminal point for transatlantic passenger service. The port is particularly valuable because meteorologically it is one of the freest from fog in the world. The facilities it offers in connection with long distance air transport were recognized in an agreement arrived at in Washington on Feb. 3, 1945, between the government of Eire and the government of the United States. The agreement provided that all eastbound air traffic from the United States to Eire and countries beyond, and all westbound traffic on the same route should stop at the Shannon port which was designated as "first European port of call." The port has been developed at considerable cost and the land base has four of the finest runways in Europe, while the buildings and piers are of the latest design. Four transatlantic passenger lines—Pan American Airways, American Export Airlines, American Airlines, and British Overseas Airways—use the port; in 1943, 15,000 passengers passed through on their planes. One of the marine basins will accommodate 15 flying boats and another is being built. Altogether nearly £2,000,000 is being spent on the Shannon Airport which will rank amongst the best in Europe.

The ending of the war in Europe had its immediate reactions in Eire. The day after V-E Day the government brought to an end all press censorship. Much other restrictive legislation was also speedily terminated though controls are still being maintained in the economic field, principally to regulate prices, to prevent inflationary movements in wages, dividends and profits, to maintain equitable distribution of scarce commodities and compulsory tillage, and to ensure priorities for imports of materials to provide work and reopen factories.

Trade and other statistics kept secret in Eire, as in other countries, during the war have been published and show how hostilities affected Eire's economic position. For example, between 1939 and 1944 external trade declined from a yearly total of over £70,000,000 to £57,000,000. Despite this decline, about £40,000,000 worth of goods (mainly foodstuffs) was sent to Britain during those five years in excess of British imports into Ireland.

There was published during the year some of the postwar schemes for industry, prepared either directly by state departments or in conjunction with them. Thus the Department of Industry and Commerce published a White Paper on the plans for building and reconstruction. The total value (at prewar rates) of the building work to be done is £73,000,000. Most of this will be spent on erecting dwelling houses, schools, factories, and hospitals. During the war, though Eire has a flourishing cement industry, there could be little building as timber and steel were not available. It is estimated that about 60,000 houses must be built, both to make up for the absence of building during the war and to continue the rehousing of the people which led to 132,000 new dwellings being provided from 1932 to 1939.

Also during 1945 a plan was published for rural electrification to be carried out by the Electricity Supply Board (the ESB) which controls all hydroelectrical undertakings in Eire. The ESB has already harnessed the Shannon (longest river in Ireland or Great Britain), has just completed the harnessing of the Liffey a few miles from Dublin, and has begun work on the northern river, the Erne, on almost as great a scale as that on the Shannon. The development of many other rivers and waterfalls is projected. These will provide the electricity which under a £17,000,000 scheme is to be brought to every farmstead, not for lighting only but to provide motive power also. Other postwar schemes include the reorganization and re-equipment of the railways at a cost of £16,000,000, the rebuilding of Irish roads, canals and aviation centers at a cost of over £18,000,000, the establishment of new industries, a national drainage scheme for agricultural land involving £7,000,000, and an extension of the present farm improvements scheme by which grants are made available to every progressive farmer.

By these projects the state hopes to provide in some measure for workers whom the end of the war will release both from the Irish Army and from war work in Britain, where over 150,000 Irish men and women went after the outbreak of the war. The demobilization of the army began in August 1945, with gratuities and deferred pay on a generous scale. The men thus released will be absorbed as quickly as possible into civil life, and a special act has been passed compelling employers to reinstate them in the jobs they had before volunteering for national defense. (There was no conscription in Ireland: the 200,000 who joined the defense forces—including the two home-based and unpaid sections, the local Defense Force and the Local Security Force—were all volunteers.) To maintain a high level of employment will require much new industrial machinery and raw materials. Part of the difficulty in securing this has been concerned in the past with shipping; to meet this difficulty Irish Shipping Ltd. was set up with state aid for the purpose of establishing and operating an Irish mercantile marine. The fleet of Irish merchant ships is still small but is to be expanded until it is capable of ensuring essential supplies to Irish consumers and Irish manufacturers, and also of extending the field of Irish exports. This development will help to provide Irish seamen with postwar jobs and Irish factories with materials for increased employment.

The Irish government has announced its intention not only to continue its policy of industrialization by which over 100 entirely new industries were set up in the seven prewar years, but also to make Ireland as far as possible self-sufficient as regards food. The position in this respect has been improved considerably during the war in the case of bread and of sugar: the wheat acreage which was only 163,000 ten years ago was 666,000 in 1945; the acreage under sugar beets which was only 57,000 in 1935, was over 85,000. (Beets are converted into sugar in four great sugar factories brought into being by state aid.) By the development of the home market the farmer and the agricultural industrialist (bacon manufacturer, butter maker, etc.) are to get a secure and profitable market at home, thus avoiding the difficulties of fluctuating prices abroad. This policy of creating a state largely self-sufficient in essentials of food, clothing, and shelter has been steadily pursued. Since 1932

the tillage area has been increased by 70 per cent or a million acres, without any decrease in the number of cattle despite inability to import feeding-stuffs during the war. Industrial output increased substantially from a total net value of £25,000,000 in 1931 to £41,000,000 in 1943, while total wages and salaries went from £14,000,000 to £22,000,000 during the same period.

One of the last acts of the Parliament before it adjourned for the long recess on July 20 was to vote £3,000,000 for gifts of livestock, food, and clothing to European nations stricken by the war. These supplies are to be provided by reduction of Eire's home consumption. The scheme has been approved by a united press and by all parties in the state. This is in addition to previous grants to various countries, including £100,000 to India and a similar sum to Italy, made through the Irish Red Cross, and in addition also to setting up in the autumn of 1945 a complete hospital, fully equipped and staffed, at St. Lô in France.

The Irish Red Cross Society is engaged in Eire itself on a country-wide campaign against tuberculosis, having set up a special antituberculosis committee which, through public subscriptions, is becoming well equipped to explain the curability and methods of prevention of the disease to the people. The state is undertaking its part in establishing special hospitals to combat tuberculosis, and in May 1945 the parliamentary secretary in charge of public health announced proposals for the erection of three sanatoria in Dublin (1,000 beds), Cork (700 beds), and Galway (400 beds), which are to relieve the pressure on the hospitals already functioning. These new hospitals will, like the whole public medical service in the state, be maintained from public funds and will be an addition to the social services which are already in operation. The year 1945, for example, was the first full year of the Children's Allowances scheme by which, as a lightening of the cost of the larger families, parents received 2 shillings, 6 pence a week for each child after the first two. This is particularly helpful in the rural parts of Ireland where the families are more numerous and money has greater purchasing power. The cost to the state is £2,300,000 a year. Other services, which aim at redistributing income, are old age pensions, widows and orphans' pensions, free milk, butter, bread, fuel, and footwear to the poor and the families of the unemployed and to the aged and the blind, unemployment assistance to all non-insured workers, and unemployment benefits for all insured workers, free school meals, a widespread school medical service and free medical attendance, including specialist treatment for all unable to provide it for themselves. There is also a national health insurance scheme the scope of which was further enlarged in 1945. It helps all employed persons in the lower income groups between 16 and 70, it provides for sickness and disablement and brings many other advantages to the people, including marriage and maternity benefits, free dental and optical treatment, free treatment at convalescent homes, etc. In 1945 the state expended over £13,000,000 on social schemes, or between a third and fourth of its entire revenue.

The great cultural event of 1945 was the commemoration of the centenary of the death of Thomas Davis, the most noted of all the writers in the Young Ireland movement of a hundred years ago. Under his inspiration his own generation and subsequent generations struggled for in-

dependence for Ireland. The government and the people joined in the celebrations which lasted a week. The president of Eire marked with a tablet the site for a statue of Thomas Davis. Artists were asked to design a special stamp which was issued on September 9; composers were commissioned to write original music for the occasion and this was broadcast on September 9, when the centenary week opened, and at its close on September 16. A bust of Davis was unveiled in the Parliament House, a special commemorative volume on Davis and his time was published, a plaque was unveiled in the house in Dublin where he died, and the week was filled with military and civic ceremonial. The government asked artists of Irish origin all over the world to submit by 1946 paintings of Irish historical interest covering the last hundred years and offered to spend a considerable sum in purchases. Under the auspices of the National Film Institute a film of Davis' life was made.

A great Military Tattoo was held in Dublin from August 28 to September 8; it reviewed Irish military history throughout the ages, making its principal feature a full reconstruction, in dress and armament of the period, of the Battle of Benburb in which Owen Roe O'Neill won his momentous victory; 1946 will be the tercentenary of that battle. Thousands of Irish troops took part in the display which was held at the spacious Royal Dublin Society showgrounds at Ballsbridge.

NORTHERN IRELAND

A division of the United Kingdom of Great Britain and Northern Ireland. It consists of 6 of the 9 counties of the old Ulster Province, namely Antrim, Armagh, Down, Fermanagh, Londonderry, and Tyrone; the cities of Belfast and Londonderry are county boroughs (units of local government independent of the counties in which they are situated). The duke of Abercorn, governor of Northern Ireland for more than 22 years, retired on Sept. 6, 1945, being succeeded by Vice Admiral Earl Granville, brother-in-law of Queen Elizabeth, hitherto lieutenant governor of the Isle of Man. The Parliament of Northern Ireland consists of a Senate of 26 members (two ex officio and 24 elected persons) and a House of Commons of 52 elected members. At the general election on June 14, 1945, the Unionist Party gained 33 seats (5 less than previously) and the Nationalists 10, minor parties winning the remaining 9 seats. Sir Basil Brooke continued as prime minister. Northern Ireland also returns 13 members to the House of Commons of the British Parliament (at the July 1945 general election, 10 Unionists, 2 Nationalists, and 1 Labour); the Ulster Nationalist Party decided on Aug. 11, 1945, to reverse the decision taken in 1935 that its members elected to the legislature of Northern Ireland and to the British House of Commons should not take their seats. For the financial year 1944-45, the estimated revenue was £16,630,000 and expenditure was placed at £16,594,000; these figures excluded the estimated cost of "Reserved" services (responsibility for which is vested in the British Parliament) and the "Contribution" to the British Exchequer (put at £35,000,000) for such Imperial services as defense. The chief industries are agriculture, shipbuilding, and the linen and textile trades. Acreage under the plough increased by 80 per cent during the war; cattle, sheep, and eggs shipped to Great Britain in 1944 had a value in excess of £6,000,000. The

acreage devoted to flax increased from 21,000 in 1939 to more than 125,000 in 1944, all linen products being devoted to the war effort. During the war the Belfast shipyards built 140 warships and 123 merchant vessels, these numbers, representing 10 per cent of the United Kingdom's total shipbuilding production. Legislation enacted in 1945 authorized the government to provide financial assistance to new and existing industries. Manufacture of fabrics from long-staple rayon is a new state-aided enterprise.

The United States, while still neutral, signed a contract on June 12, 1941, giving her facilities for establishing bases in the British Isles. In Northern Ireland, a United States naval base was built near Londonderry, "Lockheed City" was a gigantic aircraft plant, and the United States Army Air Forces acquired numerous airfields; the largest American fleet ever seen in a United Kingdom port was assembled in Belfast Lough to take part in the Normandy landings on D-day. Almost 300,000 American troops were trained in Northern Ireland. Some 25 per cent of the unmarried men of the United States Navy in Northern Ireland, and 75 per cent of like American personnel in Londonderry, married Irish girls.

For area, population, education, etc., see GREAT BRITAIN.

WHEELER B. PRESTON,
Author and Publicist.

IRON AND STEEL. The release of censorship is gradually freeing data suppressed throughout the war years, but as yet there has not been sufficient time to show much in the way of results from the countries most affected.

Iron Ore.—Mines in the United States produced a total of 111,020,145 long tons of crude iron ore in 1944. Of this total, 73,260,136 tons was shipped direct, while 37,760,009 tons was treated to recover 20,264,661 tons of sinter and concentrate, making a total of 93,524,797 tons of usable ore, not including 592,908 tons of pyrite sinter and cinder. Shipments from the mines, at 94,544,635 tons, somewhat exceeded output. All of these figures are declines as compared with 1943, when crude ore was 119,674,980 tons, usable ore 100,595,322 tons, and shipments 98,817,470 tons. It is important to note the geographical trend in production that has resulted from the war. With but the single exception of New York-Pennsylvania, all of the leading ore producing areas of the Eastern states showed declines in output (varying from 7 to 15 per cent). In the Far West, where the industry has spread during the war expansion, states that produced 2½ million tons of ore in 1943 turned out 3½ million tons in 1944. Production in the Lake Superior district in 1944 was 79,111,320 tons, 84 per cent of the domestic output, and 6 per cent less than in 1943. Lake shipments were 80,674,010 tons (including manganiferous ore) and rail shipments 1,182,995 tons.

In the first ten months of 1945 production of usable ore totaled 82,667,135 tons, as compared with 88,310,756 tons in the same period of 1944, while shipments were 83,404,381 tons against 90,519,847 tons in the same months of 1944.

Shipments of iron ore from Canadian mines in 1944 declined sharply to 498,635 long tons against 581,769 tons in 1943. The new operation at Steep Rock Lake got under way late in the year and contributed 16,552 tons of the total.

Lack of transportation has cut heavily into the normal 1,500,000-ton output of Chile, most of which was exported to the United States. In

1944 the Tofo mine, the only important producer, produced 663,879 long tons, of which 17,660 tons was shipped to local blast furnaces, and the remainder was stockpiled for future shipment.

Cuban production was similarly restricted, a normal 250,000-ton output being cut to 27,922 long tons in 1944, all of which was stockpiled.

Iron ore production in France in 1944 was reported at 9,265,290 metric tons, against 16,879,160 tons in 1943, and a peak output of 37,839,000 tons in 1937.

Newfoundland reported 464,421 long tons in 1944, against 542,805 tons in 1943.

Spanish output was 1,558,793 metric tons in 1944, of which 780,396 tons was from the Bilbao mines. This was only a nominal decline from 1,587,817 tons in 1943, but is a continuation of a trend of several years, with a drop of about 55 per cent since 1939. In the first half of 1945 there was a still heavier decrease, to 596,000 tons, against 783,000 tons in the first half of 1944.

In Northern Africa, Algeria recovered from 183,572 metric tons in 1943 to 787,768 tons in 1944, and Spanish Morocco exported 547,625 tons in 1943 and 675,808 tons in 1944, but Tunisia is still lagging, with 29,703 tons in 1943. The combined output of this area in 1939 was 4,600,000 tons.

Shipments of Swedish ore to Great Britain were resumed in July 1945.

Pig Iron.—Pig iron production in the United States reached a new record high in 1944. In spite of a slackening of demand for other war metals from mid-1944, the total for the year was 61,003,759 short tons, exclusive of ferroalloys, as compared with 60,765,195 tons in 1943. The increase is to be attributed entirely to the expansion of production in the Western states, since the increase over 1943 in those states was greater than the total increase, and the Eastern states showed a small decline. Ore consumed in blast furnaces in 1944 amounted to 109,374,151 tons of domestic origin and 255,449 tons of foreign ore.

In Canada pig iron output increased from 1,758,256 short tons in 1943 to 1,852,628 tons in 1944, while ferroalloys dropped from 218,687 tons to 182,428 tons, making totals of 1,976,952 tons and 2,035,056 tons. Production during the first ten months of 1945 was 1,508,082 tons of pig iron and 158,162 tons of ferroalloys, a total of 1,666,244 tons, against 1,721,261 tons in the same months of 1944.

Scattering returns from other countries were as follows, in metric tons, the 1944 figures being given first, followed by 1943 in parentheses: Brazil 294,573 (247,680); Mexico 134,632 (147,059); Spain 571,335 (697,318); South Africa 471,520 (486,800).

Steel.—As with pig iron, the production of steel in the United States continued to increase in 1944, reaching a new record high of 89,641,575 short tons, as compared with 88,836,366 tons in 1943. The maximum weekly output was in April, equivalent to an annual rate of 92 million tons. The all-time record for steel output in any 12 consecutive months was 90,183,816 tons, in August 1943—July 1944.

Demand for steel did not begin to decline until the end of 1944. Output in the first nine months of 1945 totaled 61,886,532 tons, against 67,325,201 tons in the same months of 1944. From these figures one may venture to estimate the year's total at about 80 million tons, or 10 per cent less than in 1944, barring interference from strikes.

In Canada steel production increased from 2,996,978 short tons in 1943 to 3,024,410 tons in 1944. About 95 per cent of the total was in ingots, and 5 per cent in castings. During the first ten months of 1945 the output was 2,454,061 tons, as compared with 2,517,005 tons in the same period of 1944.

In Brazil the new Volta Redonda plant, the largest in Latin America, is nearing completion. The coke ovens, blast furnace, boiler house and power house were completed by August 1945, the three open hearth furnaces were scheduled for completion in September, and the blooming mill for November. A rail mill is to be ready early in 1946, and a sheet and tin mill at mid-year. The capacity of this plant will nearly double the country's potential output.

G. A. ROUSH,
Editor, The Mineral Industry.

ISLE OF MAN. An island in the Irish Sea, 16 miles south of Burrow Head, Wigtownshire, Scotland, politically within the United Kingdom of Great Britain and Northern Ireland. The area is 227 square miles, and the population (1944) numbered 50,000. Douglas (pop. 20,012) is the capital, and Castletown, Peel, and Ramsey are ports. The bicameral legislature (Tynwald) consists of a Council and the House of Keys. The Council is composed of the lieutenant governor (Air Vice Marshal Sir Geoffrey Bromet, appointed Sept. 7, 1945), the bishop of Sodor and Man, 2 deemsters (judges), and 4 other members, 2 appointed by the lieutenant governor and 2 by the House of Keys. This latter body, one of the world's oldest legislative bodies, has 24 members elected by adult suffrage. In July 1945, King George VI and Queen Elizabeth visited the Isle of Man to open the proceedings of the Tynwald, this being the first time a British sovereign had ever done so. Revenue in 1943-44 amounted to £1,498,317 and expenditure was £998,953. There are 32 elementary and 5 secondary schools; King William's College (for boys) is at Douglas, and Buchan School (for girls) at Castletown. Some 76,000 acres are under cultivation, but the tourist industry is the principal source of the islanders' income. A railroad of 47 miles links the large centers. During the war the island contained several internment camps for enemy aliens.

ITALIAN EAST AFRICA. Name by which Italy called her East African possessions after she had conquered and annexed Ethiopia in 1936 and placed it together with her former colonies of Eritrea and Italian Somaliland under one administrative head. British troops occupied Italian East Africa in July 1941, and Emperor Haile Selassie of Ethiopia returned to his throne. In early October 1945 the postwar status of Eritrea and Italian Somaliland had not been determined. See also ETHIOPIA.

Italian Somaliland.—Prior to incorporation in Italian East Africa in 1936 as the "Government of Somalia," this colony had an area of 194,000 square miles, and a population (1931) of 1,021,572, of which 1,631 were Italians. The area was increased as a result of the 1936 Italian conquest to 271,042 with a population of 1,300,000. The capital is Mogadiscio (captured by British Imperial troops Feb. 25, 1941) with a population of 55,000 (8,000 Italians). Cattle raising and agriculture are the principal occupations. Exports in 1937 included sesame oil, gum, hides, butter, cotton and cottonseed oil, resin, kapok, fruit and bananas, and amounted to 40,675,000 lire. Imports including cotton goods, sugar, rice, tea,

coffee, iron, machinery, oils, tobacco, wines, and timber, totaled 378,817 lire in the same year. The revenue for 1935-36 amounted to 70,750,000 lire, and expenditure (both civil and military) totaled the same amount. There are 28 wireless telegraph stations, and 29 principal post offices and 17 secondary post offices in the country.

Eritrea.—The total area of Eritrea, prior to its enlargement in 1936 at the expense of Ethiopia and incorporation as one of the five states or governments of Italian East Africa, was 15,754 square miles (after the Italian conquest of Ethiopia increased to 89,274 square miles). The population according to a 1939 estimate was 1,500,000, and that of the capital, Asmara (captured by Allied troops April 1, 1941), was about 85,000, including 50,000 Italians. The only good port is Massaua (pop. 15,000), connected by a 75-mile railway with Asmara on the plateau at an elevation of 7,765 feet. A majority of the natives are Christian (of the Coptic rite) and Mohammedan. Three salines on the coast produce about 200,000 tons of salt every year, and gold mines near Hamasien are in production. At Massaua and in the Dahlach Archipelago pearl fishing is carried on. Most of the country is given to agriculture and pasture. There are 333 miles of railroad, 33 post offices, 1,442 miles of telegraph wire and 12,679 miles of telephone lines. During United Nations discussions regarding the fate of the Italian African colonies in late 1945 Russia suggested that Eritrea be awarded her as a mandate. The United States, Britain and France opposed the idea. It was also proposed that a corridor through southeastern Eritrea be awarded to landlocked Ethiopia, giving that country access to the Red Sea. The ceded territory would adjoin French Somaliland and probably include the port of Assab.

ITALY. The occupation of Rome by Allied forces June 4, 1944 occasioned another change in the form of the Italian government. Until mid-1943 Italy was theoretically a constitutional monarchy of which Victor Emmanuel III, who had succeeded his father, King Humbert I, on July 29, 1900, was the crowned head; actually, however, from Oct. 30, 1922, when Benito Mussolini became premier under Fascist auspices, until July 25, 1943, when Allied military pressure, causing a series of cataclysmic Italian reverses, forced the premier to resign, the government of Italy represented a Fascist dictatorship. On the latter date Mussolini was deprived of his posts as prime minister and president of the Council of Ministers, and placed under arrest by Marshal Pietro Badoglio acting in concert with King Victor Emmanuel. However, he was later rescued by agents of Adolf Hitler, German dictator, who set the Italian dictator up as head of a puppet government in northern Italy, then still held by Axis forces.

Marshal Badoglio was named Mussolini's successor as premier, and on Sept. 8, 1943, he negotiated the terms of Italy's surrender to the United Nations. In accordance with the terms of an agreement reached between Victor Emmanuel and a coalition of six anti-Fascist parties, the king resigned June 5, 1944, in favor of his son, Crown Prince Humbert who was designated lieutenant general of the realm. Synchronously the transitional Badoglio government resigned and was superseded by a government, headed by Ivano Bonomi, containing representatives of all the anti-Fascist parties. The Bonomi Cabinet yielded to that of Prof. Ferruccio Parri on June 17, 1945. In the meanwhile, Mussolini had been captured and

shot by patriots on April 28, and within the next three days the German Army in Italy as well as Marshal Graziani's Fascist Army had surrendered, on the eve of Germany's unconditional surrender and the end of the war in Europe. The Allied peace settlement with Italy was delayed by the failure of the Council of Foreign Ministers in September to come to an agreement on procedure. The ultimate decision as to the form of the Italian government, whether monarchical or republican, cannot be made until after the peace. While most of the anti-Fascist leaders, headed by Count Carlo Sforza, are committed to a republic, the powerful British influence which vetoed Sforza's position in any Cabinet as premier or foreign minister, is exerted for retention of the monarchy.

Area and Population.—The total area of Italy proper, including Sicily and Sardinia, is 119,764 square miles. The length of the peninsula is 760 miles, while its breadth nowhere exceeds 150 miles. The area of the four provinces of Libya comprising Tripoli, Misurata, Bengasi and Derna, but not including the territory of Libyan Sahara, is 213,876 square miles with a population of 66,287 (census of 1936). These African provinces were incorporated in the national territory of Italy by a decree of Jan. 9, 1939.

The Oct. 31, 1943 population figure for Italy was given in the *Statesman's Year-Book* as 45,637,000. The last regular census of 1936, when the population was close to 43,000,000, showed a density of 359 per square mile for the whole kingdom including Sicily and Sardinia.

In 1939 there were in Italy 22 cities with populations exceeding 100,000. The ten largest cities were: Rome, 1,327,000; Milan, 1,115,848; Naples, 925,325; Turin, 698,096; Genoa, 659,665; Palermo, 434,311; Florence, 354,975; Bologna, 318,444; Venice, 285,833 and Trieste, 261,368.

Education.—In the Middle Ages, Italy attracted a large number of students to her institutions of higher learning. The University of Pavia was first known as a center of learning in 825. The University of Bologna, founded in 1200, consisted of a corporation of students who hired professors to teach them. During the 13th century five more universities were founded: Naples, Padua, Genoa, Perugia, and Macerata. Ten were founded between 1300 and 1550.

In recent years much progress has been made in combating illiteracy, especially in the southern provinces. Today elementary school education is free and compulsory. There were in 1937-38 a total of 134,406 elementary schools, 2,516 government secondary schools. The teaching personnel of the 26 state universities numbered 7,490. At the end of 1938 there were 4,918,631 pupils registered in the elementary schools, 613,588 in the secondary schools and 77,429 in the universities and higher institutes.

Religion.—The Treaty of the Vatican of Feb. 11, 1929, confirmed the principle that the Catholic Apostolic Roman religion is the religion of the state; however, there is freedom of religion so long as other creeds do not violate public order or moral behavior. Catholic religious teaching is given in elementary and secondary schools. In accordance with the concordat of 1929, a church ceremony is sufficient to make marriage legally valid; a civil ceremony is optional.

There were in Italy according to the census of 1931 more than 41,000,000 Catholics (99.6 per cent of the total population). The remaining 4 per cent is divided as follows: 83,618 Protestants, 47,825 Jews and the remainder Greek Orthodox

Catholics, Moslems and those who profess no religious sect.

The measures adopted towards foreign and native Jews since 1938, which have been described as of a racial and political rather than religious nature, were repealed Aug. 1, 1944 by Premier Badoglio. The religious status of the Jewish communities in Italy theoretically had not been affected by these measures.

Agriculture.—The 1945 wheat crop, most important of all Italian crops, suffered heavily from dry weather in the south, Sicily and Sardinia; the estimated 4,180,000 metric tons indicates the smallest harvest since 1920, and roughly two thirds of the 1944 crop. Maintenance of the bread ration is dependent on increased wheat imports. The production of barley, oats and rye was reduced from the 1944 figure in about the same proportion. The Indian corn crop, despite greatly increased plantings, was normal at 230,000 tons. The yield of 400,000 tons of rice was below normal, while dry legumes (beans, peas and broad beans) suffered severely. A late September estimate indicated that an olive crop of between 900,000 and 1,000,000 tons would be less than the large 1944 crop.

Minerals.—In 1938 (latest figures available) the following products were extracted from Italy's subsoil: 360,837 (in metric tons) of bauxite, 990,043 of iron ore, 195,523 of mercury ore, 67,493 of lead, 200,848 of zinc, 930,312 of iron pyrites, 355,007 of sulphur (1939), and 48,292 of manganese. During the same year, the following metric tons of metals were produced: 864,536 of pig iron, 2,322,856 of crude steel, 48,412 of lead, 33,744 of zinc, 25,767 of aluminum, 4,700 of copper, and 2,301 of mercury.

The loss of Sicily to the Allies on Aug. 17, 1943, deprived Germany of her chief source of sulphur. During the first seven months of 1939, Germany imported 34,933 metric tons of sulphur, of which 31,924 came from Italy, most of it from Sicily. The Sicilian sulphur production in January 1945 amounted to 3,354 metric tons, and in February to 2,731 tons.

Industry.—A late September 1945 estimate indicated that if quotas of coal and raw materials requested under the Essential Import Program for the remainder of the year were fully supplied, the following industries would be able to attain these percentages of normal production: textiles, 50 (but rayon, 25); chemicals, 50; fertilizers, 75; nonferrous metals, 33; paper, 60; food products, 70; leather and shoes, 70; glass, cement, bricks, light bulbs, and miscellaneous, about 50. The chemical industry of northern Italy, though about 85 per cent intact, is hampered by a lack of materials and transport. The important Solvay soda plant near Livorno (Leghorn), which formerly supplied about 80 per cent of Italian needs for soda, has been repaired. Production began at the end of May with a daily output of 200 tons of sodium carbonate, sodium bichromate, and caustic acid. The schedule was to be increased to 450 tons daily in three months.

Foreign Trade.—The prospects for large-scale exports are dark for some time to come. The volume of 1945 trade may be judged by the fact that exports under Allied auspices in 1944, and through eight months of 1945, amounted to only 167,000 metric tons valued at about \$18,000,000 and subsidized to a considerable extent by the Italian government. Of these, products valued at about \$2,000,000 went to the United States, \$8,000,000 to the United Kingdom, \$4,000,000 to Malta, and about \$4,000,000 to France, Greece,

Yugoslavia and other countries. With a view to resumption of normal commercial relations Italy negotiated her first trade agreement with Switzerland, announced by the Ministry of Foreign Affairs on August 14. The Foreign Economic Administration sponsored American shipments to Italian civil supply authorities of basic supplies during the last four months of 1945, the types and quantities recommended by the Allied Commission in Rome. September shipments included more than 350,000 tons of coal and 100,000 tons of wheat, as well as petroleum products and miscellaneous foods.

Finances.—The Italian government estimates its war damages at approximately 2 trillion lire (\$20,000,000,000, the lire now equaling 1 cent, United States currency). For the year ending June 30, 1945, the revenue of 36 liberated provinces amounted to 13 billion lire, while the expenditures were 73 billions. Efforts to improve the national budget have centered on the floating of 5-year 5 per cent treasury bonds. In May and June, southern Italy subscribed 32,000,000,000 lire to this loan, and later northern Italy reached a total of 45,000,000,000 lire, up to August 14. On June 30, 1943, the total debt had mounted to 405,823,000,000 lire.

Military.—Service in the army (or navy) is compulsory for all males, with service liability within the age group of 21 to 55. The normal training period for all arms is 18 months. The army is divided into the metropolitan army under the Ministry of War and the colonial troops under the Ministry of Italian Africa. The metropolitan force had a normal peace establishment of 260,000 organized in 17 army corps, 1 armored and 1 motorized army corps. At the time of Italy's entrance in the war, in June 1940, her army was estimated to have a strength of 64 divisions. The Carabinieri, rural military police, in 1938 were numbered at 52,000. After Italy broke away from Germany in 1943 and became a co-belligerent with the Allies, the army was reorganized and early in 1945 six divisions had been reformed and re-equipped for field service with the Allies. Italian air units also operated in the Mediterranean with the United Nations forces.

In compliance with the armistice terms the surviving units of the Italian navy assembled at Malta; more than 100 ships reached the island, including 4 battleships, 8 cruisers and 12 destroyers. The personnel consists of 4,139 officers and 75,000 men. See also under NAVAL EDUCATION; NAVAL PROGRESS.

Transportation and Communication.—Italian roads in 1940 totaled 204,566 kilometers (126,830 miles), of which 21,456 kilometers were state roads, 46,500 provincial, 126,800 communal, 9,300 consortial, and 510 auto highways. Railways totaled 23,252 kilometers on June 30, 1939. Of the total length of railways in operation at the end of the 1942 fiscal year, 17,172 kilometers were operated by the state and 6,080 by private enterprise under state supervision. Of the state-owned lines, 5,173 kilometers were electrified.

In June 1938 there were in Italy 11,396 post offices, 10,044 telegraph offices, and 611,254 telephones. Registered motor vehicles (excluding government and military motor vehicles) totaled 703,158 in 1939, of which 345,098 were privately owned pleasure cars. During 1938 Italian air traffic totaled 8,419,493 miles, with 140,815 passengers.

A canal six miles long to connect Rome with the Mediterranean, enabling ocean-going vessels to reach the city, was planned early in 1943, two

years after completion of plans for the considerably longer ship canal between Milan and Venice.

The end of the war in Europe in May 1945 found the Italian transportation system in utter disrepair and confusion. Through the remainder of the year, with transportation functioning at only one third its normal capacity, this became the government's major problem. Locomotives and trucks were hoped for through United States surplus-property disposal. Without greatly improved transportation Italy will be unable to handle the coal and raw materials which are being shipped by the Allies.

Economy.—After the liberation of north Italy in May 1945, unemployment immediately became a critical problem, especially in the north where lack of coal and raw materials forced a stoppage of industry. An official estimate of September was that in October there would be at least 2,000,000, and possibly 3,000,000, unemployed. Normal industrial employment (1936) was about 5,375,000. Hundreds of thousands of unemployed and semiemployed workers were carried on industrial pay rolls, partly at government expense, with resultant heavy strain on private industry. Government efforts to provide employment include a public works project costing 50,000,000,000 lire and giving 200 days' employment to an estimated 450,000 workers. Though wage increases approximately doubled working-class income during the first half of 1945, and total food expenditures were relatively stable, the average family was still far from able to meet the expenses of a food budget providing 2,200 calories daily per adult. In Rome the purchasing power for food during July was estimated at only about 40 per cent of the 1940 level. Black market operations in foodstuffs, especially olive oil, are rife, despite the government's efforts at suppression. The price of meals in third-class Roman restaurants during the fall of 1945 was about 350 lire (\$3.50).

Principal Events.—The year 1945 began with German forces still fighting a desperate rear-guard action in the north against the American Fifth and British Eighth armies which included French, Polish and Brazilian divisions, as well as several Italian. On January 9 the enemy dug in for a stand along the southern bank of the Reno River near Passo di Primaro at the eastern end of the line. Five days later it was reported that they had been reinforced by a fresh division from Norway and several Fascist Italian divisions trained in Germany. However, the Allies continued to advance, and on the 19th wiped out a German bridgehead on the east bank of the Senio River.

A new Italian news agency, the Agenzia Nazionale Stampa Associata (National Associated Press Agency) began to function on January 15 to replace the psychological warfare branch of the Allied command as the source of news for Italian newspapers, and the Allied Commission in Italy announced the printing of 1,000,000 textbooks for a re-education campaign designed to eradicate Fascist teachings from the minds of the children. Three days later Alberto Tarchiani, noted journalist and anti-Fascist, was appointed ambassador to the United States.

Acting Secretary of State Joseph C. Grew issued a statement early in February denying that the Italian armistice terms required Italy to give up her colonies. On February 14 it was announced that the Grand Rabbi of Rome and his wife had become converts to Catholicism. Two days later Dr. Joseph Schwartz, European director of the American Jewish Joint Distribution

Committee, announced that only 20,000 of the former 50,000 Italian Jews remained in Italy.

Beginning March 1 the bread ration for Italians was raised from a daily 200 to 300 grams per person, or the equivalent in bread and macaroni. Gen. Mario Roatta, principal defendant in a six-weeks-old trial of 15 Fascist leaders in Rome, involving crimes of the Fascist foreign policy, escaped from his room at an army hospital on March 4. Though the government was guiltless of connivance, and offered a reward of 1,000,000 lire for his apprehension, a serious riot occurred in Rome two days later at the termination of a mass meeting called in protest at his escape. The Cabinet of Premier Ivano Bonomi, however, weathered this crisis, and on March 12 Roatta was sentenced to life imprisonment in absentia. Fulvio Suvich, former ambassador to the United States, and Lieut. Gen. Francesco Jacomini, former viceroy of Albania, received 24-year terms. Filippo Anfuso, Fascist ambassador to Germany, also in hiding, received the death sentence. Only 4 of the remaining 11 defendants were acquitted. On March 15 three of the liberated Dodecanese Islands—Simi, Nisiro and Stampalia—unanimously requested union with Greece. Pope Pius XII in his Passion Sunday (March 18) address condemned the "advocates of violence" and the "idolatry of absolute nationalism, the pride of race and blood, the desire for hegemony in the possession of worldly goods." On March 20 Umberto Nobile, the Arctic explorer and scientist, was reinstated in the Italian Air Force with rank of major general. He had been cashiered by the Fascist government in 1929, charged with responsibility for the crash of the dirigible *Italia* the year before. On March 25 Lieut. Gen. Ira C. Eaker, air chief in the Mediterranean theater, disclosed that his command had lost more than 20,570 men, 100 per cent of its strength, within the prior twelve months, as well as 2,050 heavy bombers. Two days later two American soldiers were sentenced by a court-martial in Rome to hang for the murder of an Italian in the course of a wineshop robbery.

On April 5 the Yugoslav government released proofs of German and Italian atrocities against civilians and the military. Photographs of instruments of torture, and the acts being carried out, were included. The duke of Aosta was dismissed from his post as an admiral in the navy on April 8, because of a remark he had made condemning the judges at the trial of General Roatta. The American Relief for Italy reported that in the year since April 1944 it had sent 7,186,000 pounds of vital relief supplies to liberated Italy. The purge of Fascists continued with 25 of 63 defendants found guilty by the Italian ministry of the royal house on April 18. When Crown Prince Humbert visited liberated Bologna a week later he received a surprising popular ovation. On April 28 Benito Mussolini, founder of fascism and ruler of Italy for over 20 years, was executed near Dongo with his mistress Clara Pettaci, after a summary trial by their Italian captors who had apprehended them two days before as they attempted to escape from Como after having been denied admission to Switzerland. The bodies were conveyed to Milan and dumped in a public square where they were mutilated by the angry mob. Among the Duce's followers, captured at the same time and summarily executed, were Alessandro Pavolini, Francesco Maria Barraci, Dr. Paolo Zerbini, Ruggero Romano, Fernando Mezzasoma, Augusto Liverani, Carlo Scorza, Guido Gasti, Goffredo Coppola, Ernesto Daquanno, Ma-

rio Luigi, Vito Casalnuovo, Pietro Salustri, Marcello de Facci and Nicolo Bombacci. Most of these were officials in the Fascist government. It was reported that the day before this mass execution Roberto Farinacci, at one time secretary general of the Fascist Party, was tried and shot at Milan. Another former secretary general, Achille Starace, was executed at Milan on April 29. The following day the Italian government requested that Trieste and all Venezia Giulia Province, occupied by Marshal Tito's Yugoslav troops, be governed by Allied military authorities, according to the terms of the armistice.

April also saw the crumbling and final collapse of German and Fascist resistance. Elements of the Fifth and Eighth armies captured Bologna on the 21st. Two days later they crossed the Po at several points, and also captured Modena, La Spezia and Ferrara. By the 25th the Germans were in headlong flight as Fifth Army forces reached the Mantua area seven miles beyond the Po, while French and British ships shelled points on the Italian Riviera between Oneglia and Ventimiglia. The same day Yugoslav troops crossed the Italian border at Clana; on the next, Allied forces captured Verona and Parma, by-passed Mantua and crossed the Adige River near Verona. Synchronously Italian patriots seized control of Genoa, Turin, and Milan, drove out the Germans and killed the native Fascists. On April 29 Fifth Army elements entering Milan found the bodies of Mussolini and his mistress hanging by their feet from the beams of a gasoline station. The same day the Eighth Army occupied Venice. Other places occupied were Padua, Mestre, Vicenza and Como. On the last day of April as the Fifth Army entered Turin to find it in control of the patriots, Gen. Mark W. Clark announced from Rome that the German armies in Italy had been "virtually eliminated as a military force," and that only mopping up remained. The day before at Caserta the Germans had signed terms of unconditional surrender to take effect at noon on May 2, involving 1,000,000 men in land, sea and air forces. The surrender became effective just 20 months after the Allies invaded Italy and the day on which Berlin fell to the Russians.

On May 1 Marshal Rodolfo Graziani, commander of Fascist troops, announced the unconditional surrender of his Ligurian Army; while Secretary of War Stimson in Washington disclosed that the United States Fifth Army casualties through April 28 amounted to 21,577 killed, 77,248 wounded and 10,338 missing. The next day the Italian government established diplomatic relations with the Lublin Polish government. On May 3 Italy decreed the death penalty for "serious cases" of banditry, on account of an alarming increase in crimes of violence. Yugoslav forces by this time had entrenched themselves in Venezia Giulia province and its chief port Trieste, contravening the terms of the Italian armistice. On May 19 Field Marshal Sir Harold R. L. G. Alexander, commander of the Mediterranean theater, compared Marshal Tito's seizure of Trieste to methods "reminiscent of Hitler, Mussolini and Japan." The American Army, supporting Acting Secretary of State Joseph C. Grew's declaration of a week before opposing Tito's claims, released a statement that Tito had agreed in July 1944 to Allied Military Government occupation of Trieste and had now broken his pledge. Marshal Tito expressed bitter resentment at this charge and declared that the Yugoslav Army had equal rights with other Allied armies "to remain in the territory she has liberated." On May 20 it was re-

ported that United States troops were withdrawing from Trieste, until then jointly occupied with the Yugoslavs. The situation was extremely tense; but the following day's reports contradicted the withdrawal and revealed that reinforcements had been sent to the Gorizia-Trieste area, while Yugoslav troops continued evacuation of the adjacent Austrian provinces of Carinthia and Styria. On May 23 Col. Gen. Heinrich von Veitinghoff-Scheel, commander of the German forces in Italy, was taken into custody. American university researchers estimated that the Second World War had cost Italy through 1944 the equivalent of \$94,000,000,000.

On June 5 Pietro Koch, convicted as a torturer of political prisoners in collaboration with the Germans, was executed in Rome. Two days later an agreement was finally reached with Marshal Tito and a pact signed at Belgrade providing for temporary administration of the province of Venezia Giulia, including Trieste, by the Allied military authorities. All but 2,000 Yugoslav troops were to be withdrawn, and this token force was to be stationed in a specified zone under Marshal Alexander's command. The Yugoslavs agreed to return residents whom they had imprisoned or exiled and to make property restitution. Three days later British and American authorities took control of the contested port, to the great joy of the Italian residents. On June 14 French troops occupying the Val d'Aosta region near the French border began withdrawing, in accordance with an agreement made two days earlier by General de Gaulle to evacuate the entire strip of western Italy occupied by French troops.

A leader of the Partisan forces in the north, Professor Ferruccio Parri, was selected by the Committee of National Liberation on June 17 to be premier of a new government succeeding the Bonomi Cabinet which had resigned five days previously. On the 20th the former chief of staff Marshal Graziani, Gen. Gastone Cambara, who headed the expeditionary force to Spain during the civil war, and five other generals were indicted in Rome for high treason. At Trieste a pact was signed on the 20th between Anglo-American and Yugoslav authorities partitioning the Venezia Giulia province pending its fate at the peace conference. The exact boundaries of Marshal Tito's occupation zone were thereby established, with the Allies in occupation of Trieste and Gorizia. Premier Parri's Cabinet was sworn in by Prince Humbert on the 21st, its members representing all six parties of the Committee of National Liberation. On the same day crowds of demonstrators in Milan at the Allied Military Government offices demanded bread, work and a more severe purge of Fascists.

The Allied Control Commission in Rome announced on July 1 that Italians captured in North Africa might return to their former positions in the Italian armed forces. On July 11 the Italian Cabinet granted "local autonomy" to the Val d'Aosta region along the French frontier. Next day the British Admiralty stated that up to the time of Germany's surrender the Allies had sunk 65 Italian submarines. Premier Parri on July 13 said that under the armistice terms "an effective moral and material reconstruction is not possible," and that he thought "we deserve a better status than we have now." On the 14th Italy declared war against Japan. Two days later it was revealed that the recent arrest in Trieste of the editor of a Communist newspaper and 44 others resulted from discovery of a plot to sabotage Allied military authority. The same day Premier Parri de-

clared that his government felt that opportunity should be given Italy to colonize, and that her colonists and investments in North Africa were essential to Italy's position as a Mediterranean power.

Gen. Joseph T. McNarney, American commander in the Mediterranean theater, announced on July 18 that new plans called for an all-over occupation force of about 28,000 United States soldiers to remain in Italy, ten times the original number planned. The next day an Allied military tribunal in Milan passed the death sentence on Fermo Lini for plotting the killing of Fascists or seizure of their property. On the 22d the Roman police were compelled to resort to firearms to quell rioting of 1,000 inmates of the Regina Coeli Prison. A British military tribunal on July 28 at Bari sentenced to death Gen. Nicola Bellomo for having killed a British officer and trying to kill another while they were prisoners of war. On the 29th the British Eighth Army was disbanded, and the next day Field Marshal Alexander announced in Rome the dissolution of the Mediterranean Allied Air Forces.

The Allied Commission in Rome announced on August 2 that foreign nations would be permitted to deal directly with the Italian government or commercial agencies without passing through Allied control channels, and that, effective in 48 hours, all Italy, except that part north of Bologna, would be returned to Italian sovereignty. The same day Pietro Mascagni, the famous composer of *Cavalleria Rusticana*, died in Rome. The United Nations Relief and Rehabilitation Administration in London approved aid to Italy on the 22d. Countess Edda Ciano, Mussolini's daughter, was deported to Italy by the Swiss government on the 30th.

The Council of Foreign Ministers of Britain, the United States, Russia, France and China, the Big Five, met in London on September 11 to settle matters of procedure and start work on the peace treaty with Italy. On the same day the American Fifth Army, according to an announcement from Rome, became "unoperational," its headquarters reduced to a skeletal basis; and General Bellomo, convicted in July, was executed by a Rome firing squad. The next day the Council of Foreign Ministers invited all the United Nations which had declared war on Italy to submit their views on the peace with that country. According to a London report of September 15 the United States plan submitted to the council would strip Italy of all her colonies and place them under some sort of international trusteeship. Russia won a point by getting the council's agreement to invite the Soviet republics of White Russia and Ukraine and the Polish government to express their views on the peace settlement with Italy. Two days later the council announced its inability to prepare a draft of a peace treaty

for Italy at the current session, that the matter would have to be deferred until the next session which was tentatively set for about a month after the present session should end. On the same day Greece protested to the British Foreign Office because she was not invited to present her views on Italy. On the 22d, the United States delegation requested the council to agree that no reparation demands be made of Italy and that the so-called Wilson Line be a basis for establishing the Italo-Yugoslav frontier, with modifications favoring Yugoslavia in the north and Italy in the south. It was suggested that Trieste go to Italy with "a substantial part" of its port being made a free port, that the Dodecanese Islands go to Greece, and that Libya and Eritrea be promised independence after a 10-year trusteeship.

In a statement submitted to the Allied Council in Rome on November 3, Marshal Tito's Yugoslav troops were accused of committing atrocities and deporting Italians in the Venezia Giulia area. Yugoslav Roman Catholic bishops charged that 234 priests had been killed. On the 6th, the Italian armistice terms, after having been suppressed for more than two years at the behest of American military authorities, were simultaneously announced in Rome, London, and Washington. Signed by General Eisenhower and Marshal Badoglio, they were set forth in two agreements of Sept. 3 and 29, 1943, and modified by 44 additional conditions on Nov. 9, 1943. On Nov. 7, 1945, Italy made the following proposals regarding territory: (1) Italy to retain sovereignty over Ethiopia, Tripolitania, Eritrea, and Somaliland, but to give Ethiopia a free port; (2) Dodecanese Islands to be surrendered, but Italy to have a special status in Rhodes; (3) Albania to be independent but the Albanian port of Kotor to be demilitarized; (4) Fiume and Zara to be given to Yugoslavia; (5) Trieste to become an international port under Italian sovereignty; (6) Southern Tyrol to get autonomy; (7) Franco-Italian frontier to be adjusted. Due to a difference over proposed broadening of the Parri government, the three rightist parties—Christian Democrats, Democratic Labor, and Liberals—withdraw from the Cabinet. Premier Parri thereupon resigned. After Vittorio Orlando, First World War premier, had failed to form a coalition Cabinet due to leftist opposition, ex-Foreign Minister Alcide de Gasperi, was selected as premier by the Committee of National Liberation. With his six-party Cabinet, the sixth since the Allied invasion, he took office on December 10.

J

JACKSON, Robert Houghwout, United States Supreme Court justice; b. Spring Creek, Pa., Feb. 13, 1892. On May 2, 1945, Justice Jackson was named chief American counsel on the United Nations War Crimes Commission, an international military tribunal set up for the trial of war criminals. (He retained his seat on the Su-

preme Court bench.) He arrived in Paris on May 25, and on June 7, outlined plans for organization of an international court which would include Britain, France, and Russia. From London on July 6, he announced that these powers with the United States had agreed on three principles governing the trials—the accused

shall be entitled to a fair hearing; they shall have the right to develop things that can be said in their defense; the trials shall not be subjected to defendants' obstructionist tactics. With the release on August 7 of a list of 10 former Nazi leaders slated for trial at Nuremberg in September, it was indicated that Justice Jackson was expected to prosecute this first group himself. (The list included Göring, von Ribbentrop, von Papen, Rosenberg, Keitel, Ley, Streicher, Seyss-Inquart, Frank, and Jodl.)

JAMAICA. A West Indian island 90 miles south of Cuba, constituting a British colony. The area is 4,450 square miles, and the population according to the 1943 census numbered 1,237,063. The Turks and Caicos Islands (area, 165.5 square miles; pop. 5,300) and the Cayman Islands (104 square miles; pop. 6,670) are dependencies of Jamaica (see below), and the Morant Cays and Pedro Cays are also attached to the colony. Kingston (pop. 1943 census, 109,056) is the capital and principal port. Kingston's Mona Reservoir, on the Hope River, is the largest single engineering project ever undertaken in Jamaica; when completed in 1947 at a cost of £460,000, it will store 700,000,000 gallons of water. The United States secured naval and air bases on 99-year lease in 1940, these comprising a fleet anchorage of two square miles in Portland Bight, the 50-acre Pigeon Island, and four tracts of land having an aggregate area of 278 square miles. An ancient burial cave found in 1945 at Cambridge Hill, in the parish of Saint Thomas, contained the remains of 40 or more aboriginal Indians, together with a large variety of early pottery in an excellent state of preservation. The governor (captain general and governor in chief) is Sir John Huggins (appointed July 7, 1943). He is assisted by an Executive Council of 10 members (5 of whom are elected from their number by the House of Representatives), a Legislative Council (having a clear majority of unofficials), and a House of Representatives of 32 members elected by universal adult suffrage; in order to develop the ministerial system of government, numbers of committees in the House of Representatives deal with general purposes, agriculture, education, social welfare, and communications. The new constitution providing for the foregoing legislative machinery was promulgated Nov. 20, 1944; the present system is to be tried out for a full electoral period of five years. Elections for the House of Representatives in December 1944 proved a landslide in favor of the Labour Party, which secured 23 seats; the People's National Party obtained 4, and the Independents 5, the Democratic Party being wholly unsuccessful. The Labour Party is not socialistic in its program, supporting private enterprise and harmonious relations between capital and labor. Budget estimates for 1944-45 indicated revenue of £5,490,537, and expenditure of £6,319,116.

Education.—There are 668 public elementary schools, with an enrolment (1943-44) of 163,556; 2 secondary schools were in receipt of government grants, and there are 4 vocational schools and 4 training colleges for teachers. In addition, besides 7 industrial schools, there are secondary and high schools, some endowed, which receive grants-in-aid from the government. The West India Committee of the Royal Commission on Higher Education in the colonies recommended in July 1945 that a University of the West Indies be established in Jamaica, providing faculties of arts and science, medicine, and agriculture and

agricultural science, together with departments of education and extramural studies; the capital cost of the project, estimated at £1,130,000, was to be provided by the British government, and maintenance would be met by contributions from the colonial governments, from endowments and fees.

Production.—Only about 400,000 acres of Jamaica's total area of 2,818,160 acres consist of flat land, and much of this is not utilized. A hurricane on Aug. 20, 1944, destroyed approximately 90 per cent of the banana trees and 41 per cent of the coconut palms, disastrously affecting two of the island's most important crops. Whereas 130,000,000 coconuts are gathered in a normal year, production in 1945 was not expected to exceed 75,000,000. Sugar cane, the principal agricultural product, was affected also, the estimated output of sugar in 1945 falling to 150,980 tons. Other crops grown in Jamaica include coffee, ginger, grapefruit, oranges, pimento, and tobacco. Livestock numbered (1940-41) 128,270 cattle, 10,390 sheep, 24,312 horses, mules, and asses. Guinea grass, four to six feet in height, which grows wild, affords excellent pasturage; and the forests yield dyestuffs (Jamaica is the largest producer of annatto), drugs, spices, and rare cabinet woods. Exports in 1943, valued at £3,840,488, comprised sugar, rum, citrus pulp, bananas, pimento, coffee, ginger, cocoa, and coconuts. Textiles and foodstuffs were the principal imports, which had an aggregate value of £5,515,034 in 1943. A law enacted in 1944 provided that until Dec. 31, 1950, construction materials for building hotels, and equipment for the furnishing and use of hotels, may be imported duty-free on license.

Communications.—The entire island is intersected by excellent highways having a total length of 6,942 miles; two thirds of the roads are surfaced with water-bound macadam. There are also 26.5 miles of electric, 119 miles of steam, and 73 miles of mule tramways, and 3,725 feet of ropeways. Railway mileage in the island is 212.5; there are 2,581 miles of telegraph and 2,819 miles of telephone lines (exclusive of military lines). The British West Indian Airways instituted in March 1945 a service to Belize, British Honduras, and the Royal Dutch Airlines operates between Kingston and Maracaibo, Venezuela.

Turks and Caicos Islands.—This dependency of Jamaica lies 450 miles to the northeast; the largest island is Grand Caicos, and the capital is situated on Grand Turk, named for the indigenous turban-shaped cactus. The total area of the dependency is 165.5 square miles, and the population numbered 5,300 in 1940. Administration is in the hands of a commissioner (E. P. Arrow-smith), who is assisted by a legislative board of 5 nominated members. There are 14 elementary schools (11 of them operated by the government) with an enrollment of 973, and a secondary school with 157 pupils. Salt raking is the chief industry on the Caicos islands, the product being considered the finest in the world; other industries of the dependency include lobster canning and sponge fishing. Exports, principally salt, had a value in 1940 of £38,213, and imports, chiefly cotton textiles and foodstuffs, amounted to £30,133.

Cayman Islands.—This dependency, 200 miles northwest of Jamaica, comprise Grand Cayman, Little Cayman, and Cayman Brac; the total area is 104 square miles, and the population in 1943 numbered 6,670. Grand Cayman contains two towns—Georgetown (pop. 1,462), the capital, and Boddentown; government is conducted by a

commissioner responsible to the governor of Jamaica. There are 13 government elementary schools, with 869 pupils, and 6 private schools. Turtle fishing and shipbuilding are the principal industries, and coconuts are grown extensively on the smaller Caymans. Exports in 1942 were valued at £9,762, and imports at £55,072. See also **BRITISH WEST INDIES**.

JAPAN. Far Eastern island-empire, reduced by military defeat to the territorial status it had before the modernization of the country in 1867. Acceptance of the Potsdam terms of unconditional surrender has drastically restricted Japan's sovereignty for an indefinite period. It was understood before this acceptance that the emperor would retain his prerogatives for the time being in order to carry out orders to be issued by the Allied Supreme Command. Under Allied directives, Japan is not entitled to maintain foreign diplomatic relations or to make any foreign policy of its own. Its economy is rigidly controlled and its foreign trade is subject to Allied regulation. Japanese legislation is restricted in accordance with the needs and purposes of the occupation; its executive powers are limited to the execution of measures imposed or approved by the Allies. A national government exists, although the Allies maintain the right of ordering changes in its personnel. The occupation, although planned for a long period, is not expected to be permanent. A gradual broadening of Japanese sovereignty is probable in the distant future, after the objectives of the occupation are attained.

Allied Occupational Authorities.—In accord with agreements reached among the Allies before the surrender of Japan, Gen. Douglas MacArthur, commander in chief of the United States Army in the Pacific theater of war, was appointed supreme commander of the occupation. The occupation forces assigned to police Japan are the United States Sixth Army in the south and the United States Eighth Army in the north. At the Moscow conference of the Foreign Ministers of the U.S.S.R. and the United Kingdom, and the United States Secretary of State (convened December 16-26), a Far Eastern Commission and an Allied Council for Japan were established.

The Far Eastern Commission, composed of representatives of the U.S.S.R., the United Kingdom, the United States, China, France, the Netherlands, Canada, Australia, New Zealand, India, and the Philippine Commonwealth, shall have its headquarters in Washington, D.C. Its functions are to formulate policies and principles concerning the fulfillment of the Japanese obligations under the surrender terms and—upon request—review directives given to or actions taken by the supreme commander. It will respect existing control machinery in Japan. The United States government may issue interim orders to the supreme commander whenever urgent matters arise, provided that any directive dealing with fundamental changes in the Japanese constitutional structure or in the regime of control, will be issued only with the agreement of the Far Eastern Commission.

The Allied Council for Japan is to be established in Tokyo under the chairmanship of the supreme commander of the Allied forces who shall be the United States member, other members representing the U.S.S.R., China, and the United Kingdom, the latter acting also on behalf of Australia, New Zealand, and India. The purpose is that of consulting with and advising the

supreme commander in matters of occupation and control of Japan. This does not alter the fact that the supreme commander is the sole executive authority for the Allied powers in Japan. If, however, on questions concerning a change in the regime of control or fundamental changes in the Japanese constitutional structure, a member of the council disagrees with the supreme commander, the issuance of orders will be withheld, pending agreement in the Far Eastern Commission. In case of necessity, the supreme commander may make decisions concerning changes of individual Japanese ministers or the filling of governmental vacancies after consultation with the representatives of the other Allied powers on the council.

At the time of the publication of the Moscow decisions, far reaching reforms were already imposed upon Japan, thus restricting the sphere of activity of both the Far Eastern Commission and the Allied Council for Japan.

Post-Surrender Policy for Japan.—The purposes of occupational policy, as defined by a White House statement of Sept. 22, 1945, are as follows: To insure that Japan shall never again become a menace to world peace; that a peaceful and responsible government shall support the ideals and principles of the Atlantic Charter; and that this government shall conform as closely as possible to the principles of democratic self-government. The Allied powers do not intend to impose upon Japan any kind of government which is not supported by the freely expressed will of the people.

Japanese sovereignty will be limited to the islands of Honshu, Hokkaido, Kyushu, Shikoku, and such minor outlying islands as may be determined by the Allies. The Japanese people shall be encouraged to develop a desire for individual liberties and respect for freedom of religion, assembly, speech, and the press. They shall also be encouraged to develop democratic practices and political parties.

The Allied supreme commander will exercise his authority through Japanese governmental machinery and agencies, including the emperor, to the extent that this procedure satisfactorily promotes Allied objectives. The supreme commander is empowered to require changes in governmental machinery and personnel or to take direct action if the emperor or other Japanese authorities do not function to his satisfaction. The policy is to use the existing form of government in Japan, but not to support or strengthen it.

Changes on Japanese initiative in the Japanese form of government in the direction of modifying its feudal and authoritarian tendencies are to be encouraged. In case the use of force is involved in such changes, intervention by the Allied supreme command will not go beyond measures to insure the security of occupational forces and the attainment of occupational objectives.

Japan is not to have an army, navy, air force, secret police, or civil aviation. Leading exponents of militarism and aggression are to be taken into custody and held for future disposition. Former professional military and naval officers and other devotees of militarism and nationalism shall be excluded from supervisory and teaching positions. Laws, decrees, and regulations conflicting with the occupational policy are to be voided. The judicial, legal, and police systems shall be reformed to protect individual liberties and civil rights. War criminals, including those guilty of cruelties to prisoners of war, shall be arrested and punished. The Japanese people shall be af-

forded an opportunity to become familiar with the history, culture, and accomplishments of the United States and the other democracies.

To destroy the economic basis of Japanese military strength, the production of all military goods is to be stopped at once. A ban is also imposed upon the facilities for production or repair for all such goods, including ships and aircraft. A system of inspection and control shall be established to prevent disguised military preparations. War industries and potential war industries are to be eliminated. Research and instruction serving military purposes is prohibited. Japanese heavy industries are to be reduced to peaceful requirements and Japanese merchant shipping limited to the same purpose. Pending final decisions, facilities readily convertible for civilian production shall not be destroyed.

Individuals who do not direct the future economic effort solely toward peaceful ends are not to be appointed or retained in posts of importance in the economic field. The dissolution of the big industrial and banking corporations which controlled a large proportion of Japan's trade and industry is in prospect.

The Allies will not undertake the burden of repairing war damage. Japan is expected to provide goods and services to meet the needs of the occupying forces to the extent that this can be done without causing starvation. Japanese leaders are expected to develop programs to avoid acute economic distress, to assure just distribution of available supplies, and to facilitate the establishment of a peaceful economy. They shall be permitted to establish controls over economic activities, under Allied supervision, to further these ends. Reparations shall be made through the transfer of Japanese property located outside of the territories to be retained by Japan, and of goods and facilities within Japan proper which are not necessary for a peaceful Japanese economy or the supply of occupation forces. All looted property which can be identified must be restored to its rightful owners. Japanese authorities are responsible for the management of domestic financial matters, subject to the approval of the Allied supreme commander.

Japan will eventually be permitted to resume normal trade relations with the rest of the world. During the occupation, Japan will be allowed to purchase raw materials and other goods needed for peaceful purposes from foreign countries and to export goods to pay for approved imports. Allied control is to be maintained over all imports and exports, foreign exchange, and financial transactions. Japanese assets in territories detached from Japan, including those owned by the imperial household or government, shall be held at the disposal of the Allied authorities. No Japanese business organization is allowed to give exclusive or preferential opportunities or terms to the enterprise of any foreign country or to cede control of any important branch of economic activity to such an enterprise.

Area and Population.—Pending a final decision about outlying islands, Japan includes only what the official statistics called the "metropolitan area." The size of this area is 114,500 square miles and the population figure was 69,254,148 according to the 1936 census. In 1920, the population of the same area was 55,963,053. The paper added that Tokyo, which once had a population approaching 8,000,000, now has a population of 3,276,547; Osaka, once the second largest city, has 3,092,498, and Yokohama, 2,652,988.

The excess of live births over deaths in Japan is exceptionally high. In the 10 years following 1926, it was given as 15.59, 13.81, 14.47, 12.96, 14.19, 13.19, 15.19, 13.79, 11.86, and 14.85 per thousand respectively. (On Nov. 21, 1945, the Japanese Board of Information, in a Tokyo dispatch, stated that a census of Japan proper, taken November 1, had shown a loss of 297,359 persons since February 1944. Of these, some 240,000 died in air raids, the agency said. Total population was listed as 71,996,477, of which 38,101,834 were women.)

Losses Through Capitulation.—By the act of unconditional surrender, Japan lost the officially incorporated territories of Korea, 85,147 square miles and 21,058,305 inhabitants; Formosa, 13,803 square miles and 4,592,537 inhabitants; the southern part of Sakhalin, 13,934 square miles and 295,196 inhabitants; and mandated islands, statistically listed as "Oceania," with 829 square miles and 69,626 inhabitants (1936 census figures in all cases).

Korea and Formosa, as well as the Kwantung area, leased under pressure from the Nanking government of China, contributed substantially to the metropolitan area's food supplies in exchange for metropolitan industrial goods. Their foreign trade reached a figure of about one third of the metropolitan volume and their exports of grains, cereals, sugar, and other foodstuffs were valued at 908,419,000 yen in 1937. In the same year, the value of metropolitan crops was given as 3,209,297,000 yen. There were 2,262 mines in operation in Korea, 199 in Formosa, and 21 in Sakhalin, against a total of 1,617 in the metropolitan area. Their total output, however, represented only a minor contribution to Japan's needs. Korea produced 58,146 tons of gold and silver ore and 44,698 tons of graphite; Formosa 104,384 tons of gold and copper ore (in 1935). Korea is rich in timber, but there is no timber shortage in metropolitan Japan. Industries established within the severed regions mostly served the armed forces. Under present conditions, they are of importance chiefly for payment of reparations.

In northern Sakhalin—on Soviet territory—the Japanese lost industrial concessions through their defeat which were obtained under pressure during the period of Russian weakness. The resultant loss of industrial equipment is substantial, but the loss of output is only moderate. Northern Sakhalin's oilfields, which produced about 300,000 tons a year in 1931, yielded only a little more than 50,000 tons in 1941. Coal production, too, was never high in that territory and decreased steadily as Soviet authorities hindered Japanese exploitation of the mines.

The loss of fishing concessions is more serious. Japan has had fishing rights in Russian waters ever since the end of the first Russo-Japanese War in 1905. These concessions, vastly enlarged during the revolutionary period in Russia, were gradually curtailed until 1944. Even so, they were an important factor in the urgently needed food supply of the metropolitan area.

Japanese-controlled Manchukuo (Manchuria), furnished few consumer goods to Japan proper before August 1945. Japanese experts did not expect the economic development of Manchukuo to progress far enough to contribute much to Japan's economy before 1950. Huge Japanese factories on Manchurian territory, chiefly in the region of Mukden, produced exclusively for the benefit of the invading armies on the Asiatic mainland.

The Kurile Islands—taken over by Russia—have only military value.

The greatest and almost inestimable loss which the Japanese suffered is the dissolution of their "Greater East Asia Co-Prosperity Sphere," the most ambitious imperialistic project in history. This "co-prosperity sphere," at the high tide of Japanese conquest, embraced—beside Japan proper in its pre-surrender borders—a large part of China, Manchukuo, the Netherlands Indies, the Philippines, Burma, Malaya, Indo-China, Thailand (Siam), and countless Pacific islands. It covered a territory of roughly 3 million square miles (about the size of the United States), inhabited by almost 500,000,000 people (about as many as the British Commonwealth of Nations). Conquest of the rest of China, India, and Australia—the immediate aim of the Japanese war planners—would have enlarged this sphere to include more than 50 per cent of the earth's population and an almost boundless wealth of materials. The Japanese Empire, after organizing its conquests, would have become the unlimited master of the globe.

This grandiose scheme appealed to the lust for conquest and domination of the Japanese militarists and the religious desires of the worshippers of the Japanese emperor, who believed in his mission to rule mankind. More than that, it was viewed very realistically by Japan's economic planners. They wanted the conquered territories to supply the metropolitan area with food and raw materials at incredibly low cost in exchange for metropolitan industrial goods. Although the substandard level of colonial wages would have kept individual industrial consumption very low, the Japanese planners expected that even primitive demands would keep their industries extremely busy and their profits superlatively high.

With the surrender of Japan, these hopes are dashed. Although the co-prosperity sphere had not materialized, important economic infiltrations had already been achieved. It might prove disastrous for Japanese peace production if Allied industries regain the markets previously under Japanese control.

Restrictions on Japanese shipping and the losses sustained during the war are a death blow to the rapidly growing Japanese whaling industry. Japan never adhered to international rules of whale-hunting. Its boats indiscriminately hunted small animals and other specimens protected by international conventions. The elimination of Japanese whaling will benefit other nations, especially Norway.

Political Conditions.—According to the constitution which was promulgated by Emperor Meiji on Feb. 11, 1889, Japan is a constitutional monarchy. Japanese constitutionalism, however, grants very few of the popular rights secured by the constitutions of the United States or Great Britain. The Japanese constitution states that Japan "shall be reigned over by a line of emperors unbroken for ages eternal. The emperor is sacred and inviolable and combines in himself the rights of sovereignty and the power to exercise them." The emperor is identical with the state, and his oath, upon ascending the throne, is not made to his people or his government, but to his ancestors. The emperor is not responsible to any person or agency. By acquiring the "divine treasures of the imperial ancestors" when he ascends the throne, the emperor becomes a deity. These treasures consist of a mirror, a sword, and a jewel. According to the Japanese

tradition, these were bequeathed by the first imperial ancestor, the Sungoddess Amaterasu Omikami, to her descendants in perpetuity.

No law can become valid without the emperor's sanction and only the emperor can order a law to be executed. The members of the government, appointed by the emperor, act as his advisers. As such, they are responsible only to him and not to Parliament. The emperor has the right to dissolve the Diet and to rule by decree. He is not only the supreme commander of the armed forces, but he is also exclusively entitled to determine their size and equipment. Judges are appointed by the emperor and are responsible to him alone. The institution of a regency is provided for in the imperial House Law, with the regent exercising the emperor's powers in his name. The Japanese term for emperor is "Tenno" (not "Mikado"), which means "Son of Heaven."

The Diet consists of a House of popularly elected Representatives and a House of Peers. In 1938, the upper house consisted of 413 members. Of the total, 16 belonged to the imperial family, 17 were dukes, 37 marquis, 18 counts, 66 viscounts, and 66 barons (all the foregoing held their seats by right of inheritance); 123 were appointed by the emperor; 4 were members of the Imperial Academy; and 66 were selected from among individuals who paid the highest taxes.

The House of Representatives had 466 members, a large majority of whom were all-out supporters of the government and its policy. The thought of opposition to the emperor's person or his prerogatives never arose. The members of the House of Representatives were elected by 14,401,173 voters, whereas 3,757,097 qualified voters did not cast their ballots. The right to vote, according to the latest laws, is granted to all men above 25 years of age who have paid at least 3 yen per annum in direct taxes and have resided in the same place for more than one year. Women cannot vote. The economic destitution of a considerable part of the Japanese population and active migration to the big industrial cities account for the fact that only 20.21 per cent of the population were voters in 1937. The corresponding figures for 1928, 1924, and 1912 were 19.97, 5.56, and 2.92 per cent respectively. The Japanese people have thus played only a very minor role in shaping national policy and lack basic democratic experience.

No popular revolution has ever been recorded in Japan's history, although many bloody feuds were fought by feudal clans. It remains to be seen how far the encouragement of occupational authorities will promote popular revolutions and to what extent political education can be developed among the masses.

The Diet's rights—although described at some length in the constitution—are well defined in the following Japanese comment on the constitution: "The Diet has not the right to make laws (Horitsu) but merely the right of consent." The drafting of laws is a prerogative of the government, although the Diet is allowed to make recommendations to the government as to the laws it promulgates. Every law is supposed to require the consent of the Diet, but sessions of parliament are usually convoked by the emperor only once a year for three months. Imperial decrees can be issued while the Diet is not in session and take legal effect immediately. The ordinary budget requires the Diet's approval,

but this does not give the Japanese Parliament any power comparable to that of the United States Congress. Expenditures for the Imperial House do not need this approval and the same is true of "expenses in the interest of normal exercise of governmental powers." Besides, the constitution provides for a basic budget for each branch of the government service which the Diet cannot curtail. Extraordinary expenditures can also be ordered by the government without consulting the Diet. As no executive or judicial powers are vested in the Diet, its authority is meager indeed. This might account for the poorly developed political party system in Japan and the lack of political leaders with a large popular following.

Other bodies of popular representation in Japan are 47 general councils with a total of 1,902 members (elected by 12,871,122 voters); 148 municipal councils with 5,412 members (4,613,045 voters); and 10,826 commercial councils with 149,427 members (8,883,886 voters). These councils have very limited powers and deal only with minor matters.

The ministers of state appointed by the emperor, according to the constitution, "have to give advice to the emperor and are responsible to him." A Privy Council, composed of all ministers, discusses important matters of state if the emperor asks for advice. Only the prime minister, the minister of war, and the minister of navy have direct access to the emperor. The two latter have to be high ranking officers of the army and navy respectively. This explains the overwhelming military influence in Japanese governments. If the militarists did not approve of a statesman appointed to select a new Cabinet, they declined to name any of their men for the posts of war and navy ministers and thus prevented the formation of a government. They have frequently refused to make such nominations for a Cabinet not headed by a prime minister from their own ranks. But even when a civilian became prime minister, he had to face the counterbalance of two military men in his contacts with the emperor and the militarist influence on every emperor therefore remained dominant.

The dissolution of the army and navy staff by Gen. Douglas MacArthur and the abolition of all Japanese armed forces is a most important step toward a political change in Japan. The road is now open to a government without militaristic ties and far greater civilian influence on the emperor.

The Japanese people are granted freedom of religion, of speech, of assembly, and of writing—within the limits of the law. These limits are narrowly drawn. Censorship in peace and war prevented freedom of the press until it was abolished by General MacArthur. Other civic rights were often voided by the government's proclamation of a state of siege, for which the Diet's consent was not necessary. The right to petition the government did not contribute much to the personal freedom of the Japanese subjects.

The agreement of the Allied governments to let Emperor Hirohito retain his throne was widely criticized at the time of the surrender. Experience showed that the imperial order of surrender was fully carried out without disturbances. The occupation met no resistance even from the most fanatical nationalists. It remains to be seen how far the basic Japanese political system can be revised without abolishing monarchic institutions.

These institutions are worshipped by the Shintoists—numbering about 20 millions and accepted as divine by the Buddhists, the religious majority of Japan. The Christian faith, to which idolatry of the emperor should be outrageous, has only 270,000 adherents in Japan. This small minority, tightly controlled by the government, has never raised any objections to the emperor's status.

On Oct. 6, 1945, John Carter Vincent, director of Far Eastern Affairs of the United States State Department, announced the decision of the occupation authorities to abolish Shintoism as a state religion, thus ending the identification of religion with the state. On December 22, General MacArthur's order carried out this decision. This move is likely to have far-reaching effects, but they will be eventual rather than immediate.

Social and Economic Structure of Japan.—Until the modernization of the country, Japan was a self-sufficient agrarian feudal state with some highly specialized trades and a population unchanged in number (30,000,000) for the previous 200 years. A small number of feudal lords owned large properties. Part of the nobility, too, was poor. The state is the largest landowner, with the imperial household next in wealth. Japanese industrialization did not grow organically out of smaller trades and was not rooted in popular wealth. The ruling groups established industries in order to make the nation powerful for future conquests. Japanese industry has always served armaments and transportation more than public consumption. A great aid to Japan's industrialization was the rapid growth of the population following the modernization of the country—and the difficulty of supporting a large number of people in an agricultural economy. Deterioration of living conditions in rural regions caused a steady influx of job-seekers to the cities and kept the industrial wage level extremely low. This accounts for the small buying power of the Japanese. Their industrialists have been interested primarily in export markets and raw material bases to be won by force of arms. Low Japanese wages facilitated dumping methods which other industrial countries tried to combat, thus giving Japanese industrialists another reason for hostility.

The backbone of Japan's economic structure is a small number of supercorporations, each of them controlling banking, industrial, commercial, and transportation companies. The greatest of these are Mitsubishi, Mitsui, Yasuda, and Sumimoto. Big banks, affiliated with the giant corporations, operated in Japan and in conquered territory to control economic life.

On October 1, in a surprise move, Allied occupational authorities seized 21 of the largest Japanese banks, among them the banks of Taiwan (Formosa) and Chosen (Korea), the Bank of Japan, the Hypothec Bank, and the Yokohama Specie Bank, and ousted their leading officials. These banks are supposed to be the custodians of concealed Japanese holdings and also of government and imperial funds. Their seizure, which does not affect the small deposits of private Japanese citizens, is a bold step toward the destruction of an economic structure infested with the germs of aggression and dumping. On November 6, complying with directives issued by General MacArthur, the Japanese government decreed the dissolution of Mitsui, Mitsubishi, Yasuda, and Sumimoto. These firms had extensive American connections.

The fundamental condition for an industrial reorganization of Japan on peaceful lines, with a healthy domestic market, is a complete reform of the wage system. According to Japanese official statistics, the wage earner in 1935 was paid an average of 1.87 yen per day (men—2.43; women—0.72). At the average rate of exchange for the year (100 yen equalled \$28.50), these wages amount to 58, 69, and 20 cents respectively. The textile industry, employing mostly women, paid an average wage of a little less than 22 cents (U. S. currency) a day. Male miners earned less than 50 cents, women miners a little more than 20 cents daily. The best-paid metal workers made 90 cents a day. Most wage earners had to support families. In 1938, wages had risen by about 8 per cent compared with a general price increase of 35 per cent, which was, however, kept down to 13 per cent for rice, the staple Japanese food.

This wage level accounts for the fact that only 63 per cent of Japan's factories used mechanical power. Human power was so cheap that investments in machinery were not worth while. Except for armament plants, which are now to be dismantled, and artificial silk factories, the technical equipment of Japanese industry is generally inferior to that of other industrialized countries for the same reason.

Even these meager wages attracted destitute farmers. Migration to the cities began when the overpopulation of Japan made itself felt. Between 1920 and 1935, the number of Japanese living in villages of less than 500 inhabitants was reduced by half. It also declined in places of less than 5,000, but it rose from 6,753,598 to 17,518,069 in cities of more than 100,000 inhabitants. It can safely be presumed that, during the war, at least 25,000,000 Japanese lived in the empire's great cities, most of them as industrial workers. The total population of big cities heavily damaged by B-29 incendiaries was estimated at 20,696,977 in 1945.

Of the 64,450,005 persons statistically listed in metropolitan Japan in 1930, 29,619,640 were employed (19,030,237 of them men)—14,140,107 worked in agriculture; 504,624 in fishing; 251,220 were miners; 4,269,151 worked in manufacturing industries; 3,013,903 in commerce; 1,028,595 in transportation; 1,691,803 were in free professions; 84,203 in domestic service. Five and a half per cent of the employed were less than 14 years of age. The percentage of people engaged in agriculture has declined ever since. No exact recent figures are available. With almost 10,000,000 made homeless by the bombing of Japanese cities, industrial difficulties will increase even more. Only a few of the homeless, however, could return to the land.

Emigration will not solve the problem, even if foreign countries were willing to accept Japanese immigrants. In general the Japanese do not like to leave their country. In 1935, only 684,818 Japanese citizens lived abroad (173,420 of them in Brazil, 144,451 in Manchukuo, 110,040 in Hawaii, 98,357 in the United States, 88,325 in China, 21,524 in the Philippines, and 20,827 in Peru). In the same year, the number of emigrants from Japan totaled 10,813, of whom 5,745 went to Brazil and 1,802 to the Philippines. The Japanese in Manchukuo and China were mostly officials and railroad workers. Modern Japan, unlike such other densely populated Asiatic countries as China and India, has so far been spared catastrophic famines. But it is quite possible that, with mounting conversion difficul-

ties, starvation might become a fatal regulator of the Japanese population figure.

Agriculture.—The total surface of metropolitan Japan is 38,245,000 hectares (1 hectare = 2.471 acres), but only 6,008,708 hectares were used for agricultural purposes in 1935 and this figure has not changed substantially since. It actually represents the maximum of arable land, as 84 per cent of the country is wooded, rugged, or barren. Of this farm land, 3,193,864 hectares are cultivated by landowners, 2,814,844 by tenants. More than half of the arable land (3,192,735 hectares) grew rice. The total crop value in 1935 amounted to 3,209,297,000 yen (roughly \$900,000,000 at a rate of exchange of \$28.50 for 100 yen), of which rice accounted for 2,071,889,000 yen. With almost half of the employed persons in Japan then working in agriculture, at least 30 million people—including dependents—shared this amount. This means that the rural population lived on an average of \$30 annually per person. That fact accounts for the trend toward even the poorly paid jobs in industry and the constant migration from rural to urban areas. Better fertilizer and mechanical equipment cannot contribute much to an increase of Japan's agricultural production, as they cannot be used by rice growers. Besides, the destitution of Japanese farmers would never permit them to make substantial investments.

Statistics for years later than 1935 showed higher crop value figures, but this was exclusively due to higher prices. It can safely be assumed that 10,000,000 long tons of rice, 1,500,000 long tons of wheat, 800,000 long tons of barley, and 700,000 long tons of rye are about the maximum yield obtainable in Japan.

An undisclosed but considerable part of the rice crop is used for the production of the national beverage "sake," which has been an important export item. The Japanese trade balance of food includes beverages and tobacco in its figures, thus showing imports about equal to exports. The official trade balance did not cover imports of grains and cereals from Korea, Formosa, and Kwantung. With these territories severed from Japan and the export of sake and tobacco products (the latter of poor quality) curtailed, the agricultural deficit of present-day Japan can be estimated at about 35 per cent of the country's needs, based upon the prewar population figure, and substantially higher if the later population growth is taken into account. On December 10, Supreme Allied Headquarters ordered the Japanese government to take measures to end the system of land-tenure through sweeping rural reforms to be drafted before March 15, 1946.

Livestock.—In 1936, metropolitan Japan had 1,684,462 head of horned cattle, 1,448,481 horses, 277,884 goats, and 1,063,138 hogs. The cattle quota per capita in Japan is about 5 per cent of that in the United States. Little meat is consumed in Japan, due to national habits and the low standard of living. About 8,401,000 yen worth of beef was imported from China in 1936.

Fishing.—Fish plays an important role in Japan's food supply. The value of the catch in 1935 amounted to 181,801,507 yen. Only about 7 per cent of the fish used to be sold fresh; the rest was salted, smoked, and canned, partly for export. Lack of fuel and the cancellation of fishery concessions in Russian waters will reduce the catch hereafter.

Raw Materials.—Japan is extremely short of

mineral products. The mining production of metropolitan Japan in 1935 amounted to 70,914 long tons of copper, 34,191 long tons of zinc, 610,000 tons of iron, and 41,803,000 tons of low grade coal. The substantial silver production is of little use to industry. There is no oil.

Timber is abundant. The metropolitan area has 20,575,913 hectares of woods, of which 7,417,963 belong to the state and 1,243,194 to the crown; 16,200,984 hectares of wood in Korea are lost. Wood production in 1935 was valued at 113,968,000 yen. The large wood and paper industry in Japan can carry on despite the reduction of territory, although some special materials were imported from the United States. The same is true of the artificial silk industry and the natural silk industry. Cocoons are produced in Japan proper. The wool and cotton industries depend entirely on the importation of basic raw materials and so does the fabrication of rubber goods. Japan's heavy industry, mostly to be dismantled according to occupation policy, was always in dire need of foreign raw material imports. Scrap iron from the United States was especially important.

Foreign Trade.—In 1936, Japanese exports were valued at 2,692,970,000 yen, imports at 2,763,681,000. The increase to 3,576,000,000 and 3,972,400,000 yen respectively in 1940 was due partly to inflation and partly to war.

The efforts of the Japanese economic imperialists to develop Asia as their principal export market were successful. In 1936, 509.1 per mil (thousandths) of Japan's exports went to Asia, while only 383 per mil of the imports came from the continent. British India took 96.2 per mil of the exports and contributed 134.6 per mil to the imports. Equivalent figures for Manchukuo were 56 per mil and 74.4 per mil, Kwantung 128.9 and 13.1 per mil. The Soviet Union participated only to the extent of 8.5 and 2.5 per mil respectively.

According to official statistics, the United States took 220.7 per mil of Japan's exports and contributed 306.7 per mil of its imports in 1935. The official reports covered up the trade in essential war materials, so that the real figure of imports from the United States should be higher. Argentina absorbed 8.4 per mil of Japan's exports and accounted for 10.9 per mil of the imports. The figures for Australia were 25.5 per mil and 65.8 per mil respectively. Europe had a comparatively small share of Japanese trade: 114.3 per mil of the exports, about half of which went to Great Britain, and 119.5 per mil of the imports, about four tenths of which came from Germany.

The United States ranked first as a source of iron (50 per cent), cotton, oil (80 per cent), copper, automobiles (95 per cent), machines (40 per cent), paper and paper pulp, timber and planks (the latter was only a small fraction of Japanese domestic production). It ranked second in leather, phosphates, and gasoline (after the Netherlands Indies). The United States was the principal customer for Japanese camphor, menthol, tea, silk, vegetable oils, potteries, brushes, lamps, hats, and hat straw, and the second largest purchaser of Japanese canned goods.

Japanese imports consisted chiefly of raw materials, most of which were used for war production. A part of them, as well as imports of semifinished goods, were manufactured into finished products by underpaid Japanese labor to serve Japan's program of dumping exports. Japanese statistics list the value of raw material im-

ports in 1936 at 1,737,716,000 yen and exports at 684,338,000. Corresponding figures for semifinished goods were 716,366,000 and 438,650,000. Exports of finished goods were valued at 1,563,439,000 yen, imports at only 294,358,000.

Industrial Production.—The number of plants and the value of their output in the most important branches of Japanese civilian industry in 1937 were as follows:

	No. of plants	Value in yen
Textile fabrics	19,041	1,617,575,000
Textile fibers (except silk)	534	1,467,762,000
Beverages	6,401	548,582,000
Silk	5,160	519,131,000
Fertilizer	2,494	379,883,000
Wood products	12,188	373,432,000
Paper	1,097	335,647,000
Artificial silk	46	332,358,000
Printing	3,544	258,519,000
Knitted goods	1,939	107,757,500
Vegetable oils	441	100,314,000
Glassware	969	96,375,000
Mill products	687	70,027,000

No figures are available for Japanese heavy industrial and armament production, but this output was certainly of greater aggregate value than total civilian production.

Manpower.—No unemployment was reported from Japan before the Second World War. The elimination of the country's war potential, however, will inevitably result in catastrophic industrial unemployment. The reconstruction of destroyed cities could absorb most of the idle, but it would be an undertaking of dubious value. The size of these cities was determined by the size of their industries. With war plants eliminated, fewer dwellings will be required.

Finances.—Late in 1941, the exchange rate was \$23.50 for 100 yen. Since then, the yen has greatly depreciated, and a temporary rate of 15 yen per dollar was decreed by occupational authorities. The gold cover, as far as it had been discovered by Oct. 1, 1945, amounted to \$125,000,000 for 8,600,000,000 yen banknotes in circulation in the homeland and an undisclosed but extremely large volume of paper currency in severed and formerly occupied territories. Far-reaching inflation is a serious threat despite counter measures inaugurated by the occupation authorities.

Japanese budgets, as published, hardly ever gave a clear picture of the nation's receipts and expenditures. For the fiscal year 1936-37, they were given as 2,372,099,000 and 2,282,176,000 yen respectively. The real expenses undoubtedly ran much higher. The budget of 1939-40 merely stated that receipts and expenditures were equal at 4,804,544,000 yen and listed extraordinary expenditures 35 per cent higher than ordinary ones. Since 1942, expenditures have risen sharply and continuously, reaching the 50 billion yen mark (according to reliable estimates) in 1944-45. Not more than 25 per cent of war expenditures were covered by taxation. War loans were issued. Inflation will reduce the value of the bonds and accelerate Japan's pauperization.

In peacetime, a substantial part of the public receipts (19 to 35 per cent) came from state property. State assets outside metropolitan Japan included most of the land in Formosa and a substantial part of Sakhalin. State domains were assessed at 8,593,047,000 yen in 1934, and at 11,935,390,000 yen in 1938, after the Japanese conquests in China. This amount equaled about 80 per cent of the total investments in Japanese corporations. State domains covered 14,765,976 hectares of land and a built-up urban area of 41,077,253 square meters (1 square meter =

1.196 square yards). The real estate holdings of the imperial house are assessed at 2,500,000,000 yen. Although state and imperial possessions are supposed to be used for reparations, a large part of them are located in severed or liberated territory and are therefore classed as loot. These assets will be restored to their former owners or taken over by the Allies without credit on the reparations bill. No exact figure for Japanese foreign holdings is yet available. A thorough checkup of the accounts of seized banks and corporations should produce this information.

Transportation.—Japanese railroads in the reduced empire totaled 14,984 miles in 1936, of which 10,576 were state-owned. Of the total, 12,511 miles were single-tracked. In 1936, railroad traffic amounted to 1,634,233,578 passenger rides and 68,598,177 long-ton miles of freight. The road network consists chiefly of 5,534 miles of well-kept state highways and 62,386 miles of rather poor secondary roads.

The Japanese relied heavily on water transportation. The real tonnage of Japan's merchant marine probably ran as high as 10 to 11 million tons at the outbreak of the Second World War. Official statistics, seeking to conceal Japan's naval potentialities, give the 1937 figure as 4,469,326 tons of steamships and 1,478,312 tons of sailing vessels.

No rolling stock statistics are published, but bombing and lack of adequate repairs and replacements have undoubtedly reduced it below the subsistence minimum. Lack of fuel also hampers road transport. The drastic reduction of Japan's merchant marine will add to transportation difficulties.

Education.—Metropolitan Japan had 48,215 schools with 15,242,333 pupils in 1937. Only 119 of the schools, with 74,933 students, were owned by the state; 44,691 schools with 14,328,062 pupils were listed as "public," i.e., municipal and institutional. The education level of Japan is high. Illiteracy in the metropolitan area is less than 1 per cent. Not much was done about education in the conquered territories.

Prosecution of War Criminals.—It was decided to use Japanese civilian authorities to arrest criminals pursuant to the requests of Allied authorities. The lists of war criminals are not yet completed. Many of the leaders chiefly responsible for Japanese aggression and the mistreatment of prisoners of war, such as former Prime Minister Hideki Tojo, Gen. Masaharu Homma, Vice Admiral Godo, Shigoe Odate, Viscount Okochi, Lieut. Gen. Oshima, and Count Sakai have already been placed under arrest. Prince Konoye escaped arrest through suicide.

The first war-criminal trial started Oct. 8, 1945, against General Tomoyuki Yamashita, conqueror of Singapore and the Philippines in 1941. He was charged with "unlawfully disregarding and failing to discharge his duties as commander to control the operations of members of his command, permitting them to commit brutal atrocities and other high crimes." Sentenced to death, General Yamashita appealed. Field Marshal Count Juichi Terauchi, commander in chief of the Japanese armies in Burma and Malaya, was also arrested as a war criminal.

Evidence found after the occupation of Japan and the rescue of prisoners in formerly Japanese-controlled territory confirms previous reports of physical mistreatment and starvation of prisoners, murders, and constant violations of the Geneva Convention. American authorities and public opinion are unanimous in demanding severe pun-

ishment of the culprits. There is reason to believe that the prosecution of Japanese war criminals will be vigorously carried out.

The Occupation in Practice.—Energetic steps have already been taken to put the occupation program outlined into full effect, and by the end of the year, the program was actually carried out to a very large extent.

On September 26, Japanese Army and Navy authorities were ordered to turn over to Allied occupation authorities not only all arms and military equipment, but supplies of food, clothing, and motor transportation that can be used for civilian relief. Such supplies will be distributed through the Japanese home ministry under Allied control.

On September 24, general disassociation of the press from the government was ordered. On September 29, General MacArthur directed the Japanese government to remove all censorship restrictions from freedom of the press. He also ordered the dissolution of the Kempei (Japanese Secret Police) by October 10. The Kempei, counterpart of the German Gestapo, frequently imprisoned, detained, or otherwise oppressed persons suspected of liberal tendencies. General MacArthur's directive included the immediate liberation of persons imprisoned or interned for any reason connected with freedom of speech, thought, religion, or assembly. The supreme commander likewise ended Japanese governmental control of Christian religious institutions.

The Japanese Army and Navy General Staff were abolished by order of the Allied commander in chief on September 29. This leads to the abolition of the ministries of Army and Navy, thus paving the way for the establishment of a truly civilian government and the elimination of the predominant military influence upon the emperor. It also eliminates the foremost pillar of imperial power. Emperor Hirohito's unexpected call on Gen. Douglas MacArthur at the General's Headquarters was widely interpreted as a token of the emperor's desire to co-operate faithfully in fulfillment of the surrender terms.

Rumors of the emperor's intention to abdicate had not been confirmed at the time of writing. Such an abdication could take place in favor of the emperor's 12-year-old son and could lead to the establishment of a regency if the Allies wish to accept the provisions of Japan's constitution.

According to the blueprint of Allied policy, occupation authorities are not supposed to repair war damage nor to reform Japanese economy and find employment for Japanese labor. This responsibility falls upon the Japanese themselves. It will be extremely difficult for Japan to cope with the resultant problems.

Japanese public reaction to the foreign occupation of their country, the first in its history, is not yet conclusive. Accepting the emperor's orders with their customary obedience, they did not resort to violence. But there is no sign as yet of any trend toward democratic reforms, political progress, or an understanding of democratic ways of life. Neither the Japanese nor the occupation forces show much interest in fraternization.

General MacArthur has voiced his personal opinion that the occupation of Japan, although it will last for a considerable but indefinite period, may be carried out by comparatively small forces. It was emphasized that the possible reduction in the number of occupation troops will not relax their control over all of Japan's potentialities.

Events in 1945.—(See *WORLD WAR SECOND—1945*.) Little news came out of Japan early in 1945. It was evident that the people submissively and stubbornly carried on the task imposed upon them by their emperor and government. Allied bombings, although increasing in frequency and effectiveness, had not decisively weakened the war effort. Although all hope of final victory had vanished, the Japanese war-lords still clung to the belief that the Allies would finally become too exhausted to refuse a negotiated peace. Russia's hands were still tied by the nonaggression pact of 1941.

With the progress of the occupation of the Philippines, the conquest of Iwo Jima, and the sharp rise in the bombardment of the home islands early in March, the situation of Japan deteriorated rapidly. It was a tremendous moral blow when, on March 25, Russia declared her intention of discontinuing the nonaggression pact. The cancellation of Japanese fishing rights in Soviet waters and industrial concessions in northern Sakhalin followed. It became obvious that the Soviet Union would eventually enter the war against Japan to recover Russian losses sustained since 1904 and to obtain access to warm water ports in the Pacific.

On April 5, the Cabinet of Gen. Kuniaki Koiso was replaced by a new government headed by Kantaro Suzuki, with Gen. Rukuzo Sugiyama as War Minister and Admiral Mitsumasa Yonai as Navy Minister. The Suzuki Cabinet seemed prepared to accept "face saving" terms but not to surrender unconditionally.

As Japanese setbacks increased in all the widespread Pacific theaters of war, Japanese tactics became increasing desperate. (See *WORLD WAR SECOND—1945*.) The Japanese air force, short of fuel, reduced in numbers, and partly husbanded for defense against the invasion of the home islands, offered little opposition to United States raids. Fire and explosives rained from B-29s. Carrier plane attacks and other bomber missions from conquered Okinawa created frightful devastation. Japanese suicide planes—kamikazes (See *WORLD WAR SECOND—1945*)—caused substantial losses to United States and British naval forces, but could neither stop nor delay the Allied advance.

Germany's capitulation on May 7 and 9 produced no immediate reaction by Japan. It was later learned that the Big Three had agreed at Yalta that Russia should join the Pacific war within three months after victory in Europe was won. Japanese attempts to secure Russian mediation between her and the Western Allies to obtain terms short of unconditional surrender evoked no response. On July 21, the Allies—not then including the Soviet Union—issued a declaration at Potsdam which warned Japan to give up soon or face total destruction. The Potsdam Declaration—leaving no doubt that by "giving up soon" unconditional surrender was meant—did not go into details and failed to mention the person of the emperor and his eventual status. Five days before the declaration, the test of the new atomic bomb had been carried out secretly and successfully in New Mexico.

There was no immediate Japanese reaction to the Potsdam Declaration. Damage to Japan by bombs and shells was already tremendous. About 170,000 persons were killed, 240,000 wounded, and more than 9,000,000 made homeless. The Japanese Navy had ceased to exist as an effective force. The potentialities of the Japanese air force were negligible and the position of the Japanese

expeditionary forces in the distant theaters of operation had become critical. But, a huge Japanese army—almost 2 millions strong—had assembled to defend the home islands against Allied invasion and had not seen action. The invasion of Japan—although its success was hardly in doubt—was expected to be extremely costly and protracted.

On August 5, the first atomic bomb, dropped on Hiroshima, shook the Japanese Empire to its foundations. The imperial Cabinet met. On August 8, Russia declared war on Japan and another atomic bomb hit Nagasaki. (See *ATOMIC BOMB and WORLD WAR SECOND—1945*.)

Through Swedish and Swiss intermediaries, Japan sued for a peace based upon the Potsdam Declaration, provided it did not involve the prerogatives and the person of the emperor. In their answer, the Allies made it known that the emperor might retain his throne for the time being with the understanding that his power would be limited to the execution of orders to be issued by the Allied command. This does not commit the Allies to retain the emperor as their agent. It is neither a guarantee for the continuance of Hirohito's rule nor for the maintenance of the monarchy as an institution. After some stalling, the Japanese accepted on August 14, 1945.

Gen. Douglas MacArthur, in charge of accepting the Japanese surrender, which took place formally on the United States battleship *Missouri* on Sept. 1, 1945 (September 2, Tokyo time), granted the Japanese request to let the far-flung imperial armies capitulate individually after receiving formal imperial orders, which took some time. The capitulations were carried out one by one: in the Philippines, in Burma, in China, in Manchukuo, in Singapore and Hongkong. The Japanese commanders and their troops gave evidence of remarkable discipline in accepting the emperor's orders. The Japanese main islands and the city of Tokyo were occupied by the United States forces without firing a shot, beginning on September 8. No cases of die-hard resistance were encountered.

A Japanese "surrender Cabinet," headed by Prime Minister Prince Naruhiko Higashi-Kuni (among the candidates for prosecution as war criminals) was temporarily established. The power of this or any other Japanese government is extremely limited and the Allies can change or even abolish the government whenever they choose.

On October 5, Premier Higashi-Kuni handed his Cabinets' resignation to Emperor Hirohito. The ostensible reason was that the first phase of occupation and demobilization had been concluded. The true reason was rather General MacArthur's order that Home Minister Iwao Yamazaki, who had played a leading role in the suppression of personal liberties, must be removed from his post. The resignation was accepted immediately and Baron Kijuro Shidehara was charged with the formation of a new government. Baron Shidehara was ambassador to the United States in 1922 and Foreign Minister of Japan in 1924 and 1929. His reputation is that of a liberal by Japanese standards.

On October 15 General MacArthur announced that complete demobilization of both the Japanese Army and Navy had been effected.

After half a century of constantly growing and successful aggression, modern Japan has suffered its first defeat, destroying the fruits of

JAPAN

Major, Austrian Army; Author of *Phantom Victory*; *Blitzkrieg* and *Bluff*.

JAPANESE SOUTH SEA ISLANDS. By the Treaty of Versailles, Japan was given a mandate over the former German islands in the South Sea north of the Equator, in Micronesia. Together these Pacific islands—the Marianas, Carolines, and Marshalls—comprise an area of about 800 square miles, with a total population of approximately 110,000.

On Jan. 1, 1944, the *Army and Navy Journal* announced that it had been agreed at the Cairo and Teheran conferences, held in 1943, that the United States should be awarded the Japanese mandated islands, which became targets of intensified aerial bombardment early in 1944. The Marshalls were invaded by United States forces February 1. American forces landed in Saipan, in the Marianas, on June 15, and on September 15, Peleiu, on Palau Island, in the Carolinas, was invaded. Guam, (q.v.) in the Marianas, was invaded on July 21, and United States rule was re-established on the island on July 27, the first United States possession to be recovered since the beginning of the war. From Saipan, on November 24, was launched the first of a series of air raids on Tokyo designed, according to Gen. Henry H. Arnold, commander of the Army Air Forces, "to soften up the Japanese heart for the ultimate invasion."

Marianas (Ladrone) Islands.—A group of 14 islands (exclusive of Guam, ceded to the United States in 1898), purchased by Germany from Spain in 1899. They are situated east of the Philippines and approximately 1,200 miles south-southeast of Japan. The area is 246 square miles, and the population (1935) 44,025, including 39,728 Japanese. Saipan is the seat of government. On Feb. 13, 1945, Japanese garrisons on the islands of Pagan, Rota and Agrigan were estimated at 5,000. On June 28 Guam headquarters announced that six more of the group had been brought under control by Negro troops who landed and removed Japanese civilians. Enemy forces still remained on Pagan and Rota.

Caroline Islands.—This group comprises some 560 coral and volcanic islands situated north of New Guinea with a total area of about 390 square miles and a population (1935) of 48,048. The group is divided for administrative purposes into the Eastern Carolines, with Truk (pop. in 1935, 17,133, including 1,980 Japanese) and Ponapé (11,467, including 2,486 Japanese) as the centers of administration, and the Western Carolinas, with Yap (6,650, including 633 Japanese), and Palau (12,798, including 6,553 Japanese) as the centers of administration. Ponapé is the largest mandated island, having an area of 130 square miles. Truk, about 800 miles north of Rabaul, New Britain, was a key Japanese naval base. It was heavily bombed throughout 1944, but remained in Japanese hands at the close of the year when the Allied line of advance from Australia, New Guinea and Melanesia had bypassed it and swept as far north as Saipan in the Marianas. Fais, 60 miles east of Ulithi, was captured by American troops on Jan. 2, 1945. On February 13 a United States Navy spokesman estimated that of 83,000 Japanese troops in the Carolines, 50,000 garrisoned Truk. The re-

mainder were divided as follows: Ponapé, 10,000; Yap, 10,000; Woleai, 6,000; Kusaie, 4,000; Puluwat, 3,000. The islands were under almost continuous bombardment by American ships during 1945. On June 14-15 a British naval task force made a powerful attack on Truk. The population of the Carolines is mainly of Malay origin, with some Chinese in addition to the Japanese. Copra and phosphates are the chief exports. Palau is an important source of bauxite. The United States normally has cable rights in Yap.

Marshall Islands.—Two chains of lagoon islands, of which many are uninhabited, known respectively as Ratak (18 atolls) and Ralik (14 atolls). The area is approximately 160 square miles, and the population (1935) 10,446, including 481 Japanese. The administrative center is Jaluit, 725 miles east of Ponapé in the Carolines. Coco-palm and sugarcane plantations are cultivated, and the principal export is copra. There are primary schools for Japanese and for natives. On Feb. 13, 1945, the number of the Japanese garrison was estimated at from 12,000 to 14,000. An American naval force rescued 494 natives from Jaluit Atoll on May 6, under Japanese fire. On June 30 natives of Majuro, Arne and Aur atolls petitioned the United States "to be our guardian and protector" when the war is over. See also under WORLD WAR, SECOND.

JARVIS. A small isolated island in the Pacific Ocean, about 1,300 miles south of the Hawaiian group, with an area of somewhat more than 1,000 acres. It was claimed independently for both the United States and Great Britain by ship commanders. The priority of the former was established in 1936, and in the same year the island was placed under the jurisdiction of the United States Department of the Interior. Apart from its limited guano deposits, Jarvis is important mainly on account of its strategic position on the supply line between San Francisco and New Zealand. It has a small air station.

JELLIFFE, Smith Ely, American neurologist; b. New York, Oct. 27, 1866; d. Huletts Landing, Washington County, N.Y., Sept. 25, 1945. Dr. Smith Ely Jelliffe was a healer of mental and nervous diseases, in which he had a large practice, an editor of important medical journals, and the author of more than 400 papers on a wide variety of subjects, as well as several books. He also found time for many hospital activities and to appear as a mental expert in celebrated criminal trials.

Dr. Jelliffe received an M.D. degree from the College of Physicians and Surgeons, Columbia University, in 1889, and M.A. and Ph.D. degrees in 1900 and 1899 respectively. He received a B.A. degree from Brooklyn Polytechnic Institute in 1898, and studied in Vienna, Paris, Munich and Berlin. He served as visiting neurologist at New York City Hospital (1903-13); clinical professor of mental diseases at Fordham University (1907-12); and professor of pharmacognosy and technical microscopy (1897-1907) and instructor in materia medica and therapeutics (1903-07) at the College of Pharmacy at Columbia University. From 1911 to 1917 he was an adjunct professor of diseases of the mind and nervous system at the New York Post-Graduate Medical School and Hospital. He was editor of the *Medical News* (1900-05); asso-

ciate editor of the *New York Medical Journal* (1905-09); managing editor of the *Journal of Nervous and Mental Diseases* (1902-45) and of the *Psychoanalytic Review* (1913-45). He contributed several articles to the *ENCYCLOPEDIA AMERICANA*.

JERSEY. See **CHANNEL ISLANDS**.

JEWISH WAR VETERANS OF THE UNITED STATES. Second oldest veterans organization in the United States, having been founded in 1895, its membership July 30, 1945, numbered 120,000 (40,000 active and associate members; 80,000 in the armed services). During 1945 the organization devoted its energies to servicing veterans, their families and dependents; participation in war bond drives; organizing mass blood donations; presenting rest rooms, recreation rooms, books and other necessities to camps; making available certain appliances to disabled veterans in veterans' hospitals such as exercycles, wheelchairs, games, etc.; and to promoting patriotic rallies. Up to August 1, the annual encampment of the organization had been postponed because of the ban placed by the government on conventions. The organization publishes the *Jewish Veteran*, a monthly magazine of interest to veterans and their families, and the *J. W. V. Reporter*, a monthly newspaper devoted to the activities of the organization. Officers in 1945 included Archie H. Greenberg, national commander; Nathaniel Kaplan, national adjutant; and William Berman, executive secretary. National headquarters: 276 Fifth Avenue, New York City.

JEWISH WELFARE BOARD, National. See **NATIONAL JEWISH WELFARE BOARD**.

JIMENEZ OREAMUNO, Ricardo, Costa Rican lawyer, agriculturalist, and statesman: b. Cartago, Costa Rica, Feb. 6, 1859; d. San Jose, C.R., Jan. 4, 1945. One of Costa Rica's most distinguished citizens and an outstanding statesman, Señor Jiménez was the only president of that republic to serve three full terms: 1910-14; 1924-28; 1932-36. He began his diplomatic career as minister to Nicaragua and Salvador; and later filled the Cabinet posts of minister of foreign affairs, treasury and public instruction. He served as president of the Supreme Court of Justice in 1892, and later for three terms as deputy to the Constitutional Congress. While serving his second term as president, Señor Jiménez made efforts to end the Nicaraguan revolution by mediation. When he was elected for a third term in 1932, one of the defeated candidates, Manuel Castro Quesada, started a rebellion, which was eventually settled with a peace parley in the United States legation. That same year, President Jiménez signed a decree denouncing the Central American peace pacts in accordance with Article 18 of the Treaty of 1923, which restricted recognition of revolutionary governments.

JOHNSON, Hiram Warren, United States senator from California: b. Sacramento, Calif., Sept. 2, 1866; d. Bethesda, Md., Aug. 6, 1945. Always a staunch individualist and tenacious defender of his convictions, Senator Johnson began his career as a liberal champion of reform and died the last of the great isolationists. Unshaken in his stand on foreign policy, he opposed America's entry into the League of Nations, the Four-Power Pact, the London Naval Treaty, and more recently fought against the World Court Plan, revision of the Neutrality Act, reciprocal trade

agreements, peace-time selective service, and lend-lease.

Senator Johnson left the University of California during his junior year and in 1888 was admitted to the California bar and began practice in Sacramento with his father and brother. In 1902 he moved to San Francisco and soon built up a reputation as one of the best jury lawyers in the state. In 1906-07 his name came prominently before the public when he served on the staff of prosecuting attorneys in the graft cases involving leading city officials as well as almost all the public utilities in San Francisco. In 1908, he was selected to take the place of Francis J. Heney, after the latter had been shot down in court while prosecuting Abe Ruef for bribery, and secured Ruef's conviction. With a platform promising clean-reform government and a pledge to break the hold of the Southern Pacific Railroad on California politics, he was elected governor in 1911, and during his administration California took the lead in workmen's compensation, woman suffrage, a direct non-partisan primary, and prison reform. In 1912 he left the Republican Party to run for the vice presidency with Theodore Roosevelt on the Bull Moose ticket. During the 1916 presidential campaign, he was supposed to have caused the defeat of Charles Evans Hughes, who, when he came to California, neglected to visit Johnson, and "thus lost Johnson, California, and the election." Senator Johnson resigned as governor on March 15, 1917, to take his place in the Senate, to which he had been elected in the fall of 1916. He was re-elected to the Senate in 1922, 1928, 1934, and 1940. He lost his chance at the presidency in 1920 by refusing to become vice presidential candidate on the Republican ticket with Warren G. Harding, who died after serving little more than two years of his term. Senator Johnson bitterly opposed all of Hoover's policies and again broke from his party to support Franklin D. Roosevelt for the presidency in 1932. Later he took issue with Roosevelt on the World Court Plan, the Supreme Court reorganization, neutrality legislation, and the third term. Shortly before his death, Senator Johnson cast a lone vote in the Foreign Relations Committee, of which he was the ranking minority member, against reporting the new World Charter to the Senate without change.

JOHNSON, William Eugene, American prohibitionist: b. Coventry, N.Y., March 25, 1862; d. Binghamton, N.Y., Feb. 2, 1945. Nicknamed "Pussyfoot" because of his catlike policies in pursuing lawbreakers, Mr. Johnson crusaded for prohibition first in the United States and later all over the world. He was probably the most successful individual worker in this field, although he frankly admitted that he lied, bribed and drank to put over prohibition in America.

Educated at the University of Nebraska, Mr. Johnson worked on the staff of the Lincoln (Nebr.) *Daily News* from 1884 to 1886, and then became manager of the Nebraska News Bureau. It was during this period that he began to crusade on behalf of temperance. His exceptional zeal for this cause was recognized by the government, and in 1906 he was appointed special agent of the Department of the Interior to enforce laws in Indian Territory and Oklahoma. From 1908 to 1911, he was chief special officer of the United States Indian Service, and during that time he secured more than 4,400 convictions.

Not content with his work in the United States, Mr. Johnson set out to fight alcoholism in Europe, Asia, Africa, Australia, and the South Sea Islands. He accidentally lost his right eye when a stone was thrown at him during a prohibition meeting in London in 1919. He was a delegate to the 14th International Anti-Alcoholic Congress at Milan in 1913, and at Tartu, Estonia, in 1926. He was also a member of the International Temperance Committee of Fifty, Paris, 1919, and a director of the Scientific Temperance Federation of Boston. In addition, he was managing editor of 35 publications of the Anti-Saloon League (1912-16), and publicity manager and later director of the London office of the World League Against Alcoholism.

JOHNSTON, Eric Allen, film industry executive: b. Washington, D.C., Dec. 21, 1896. Mr. Johnston succeeded Will H. Hays as president of the Motion Picture Producers and Distributors of America, Inc., on Sept. 19, 1945, becoming titular head of a \$2,000,000,000 industry. President of the United States Chamber of Commerce at the time of his appointment, he stated he would retain his leadership of that organization until expiration of his term of office in May 1948.

Mr. Johnston took his LL.B. degree at the University of Washington in 1917. In the First World War, he served as a captain in the United States Marine Corps, 1917-22; was honorably discharged as the result of a head injury received while he was serving as assistant naval attaché, Peking, China. In 1923, he and a friend purchased an electrical manufacturing company in Spokane, Wash., and 10 years later, expanded it into two separate organizations—Columbia Electrical and Manufacturing Company and Brown-Johnston Company, reportedly the largest manufacturers of electrical equipment in the northwest. He is still president of both these concerns. From 1931-32, he was president of the Spokane Chamber of Commerce; director of the United States Chamber of Commerce, 1934-41, and president since 1942. The youngest man ever to have headed the United States Chamber of Commerce, his candidacy for the post was sponsored by a group which stood for more co-operation between private industry, government, and labor. In June 1944, Mr. Johnston visited Russia; there he addressed Soviet trade and government officials in Moscow, toured Soviet factories and the Finnish war front, and discussed postwar trade problems with Foreign Trade Commissar Anastas Mikoyan. In October 1944, he received the Capt. Robert Dollar Award for his contributions to the promotion of foreign trade. On March 28, 1945, with William Green, AFL president, and Philip Murray, head of the CIO, he signed the labor-management charter of principles for postwar industrial relations. (The charter calls for mutual recognition of collective bargaining and of each other's rights and responsibilities; social security measures; an internal security organization; and the establishment of a national business-labor committee to help carry out these principles.) In July 1945, Mr. Johnston was named chairman of a subcommittee set up by the War Mobilization Advisory Board to study the guaranteed wage from the standpoint of the voluntary system.

JOHORE. See **BRITISH MALAYA.**

JOURNALISM. In a year crammed with front page news stories the leads went easily to the accounts of the cessation of fighting in Europe

May 8, and the coming of peace in the Pacific area when Japan accepted the Potsdam declarations August 14. Extras poured forth with editors using their largest type and strongest banners.

The sudden death of President Franklin D. Roosevelt at 5:40 P.M. EWT on April 12, at Warm Springs, Georgia, brought extras from nearly every daily newspaper in the country. Only reporters from the three wire services were with him on his trip South.

Two premature peace stories touched off some extras and demonstrations. On April 28, the AP carried a story of German surrender from San Francisco based on statements by Senator Tom Connally. On August 13, the United Press flashed that Japan had surrendered. The flash was killed two minutes later but not before radio announcement started celebrations.

Jumping of the release date on the German surrender at Reims, France, by a full day, by Edward Kennedy of the Associated Press touched off a heated controversy on the ethics involved. Kennedy took full responsibility for not abiding by what he termed political censorship on the part of SHAEF (Supreme Headquarters Allied Expeditionary Forces). Filing privileges of the AP were revoked in Europe for a few hours. Kennedy was recalled to this country.

The epochal story of the atomic bombing of Japan August 5, announced the next day, with its tremendous possibilities both for war and for peace was given full play by all newspapers. Science editors were granted full rein in explaining the processes involved in the splitting of the atom and the unleashing of undreamed of power. Other outstanding stories were the entrance of Russia into the Pacific war on Japan August 8, the occupation of Japan by Gen. Douglas MacArthur's forces following the signing of the formal surrender document on the battleship *Missouri* in Tokyo Bay.

Voluntary wartime censorship of the press, directed by Byron Price, terminated August 15. Mr. Price paid tribute to editors who had made it a success. He termed the atomic bomb experimentation, much of it known to some editors, the best kept secret of the war.

Rationing of newsprint stopped Dec. 31, 1945, in its third year. But a world-wide shortage of the commodity gave no prospect of unrestricted use. Newspapers, despite record circulations, used 13.6 per cent less newsprint in 1944 than in the previous year. Many large dailies were forced to omit large amounts of advertising to conserve paper. Rationing of paper for magazines and books ceased August 15.

Circulations were at the peak for the fifth consecutive year. Figures in *Editor and Publisher International Yearbook* dated Jan. 31, 1945 show circulation of 18,059,252 for 338 morning papers, an increase of 5.7 per cent over the year before and circulation of 27,895,586 for the 1,406 evening papers, a gain of 2.1 per cent.

The government suit against the Associated Press on the ground that it violated provisions of the Sherman Antitrust Act was decided in favor of the government in a 5 to 3 decision by the United States Supreme Court June 18. The AP was ordered to rewrite its by-laws so that it could serve competitors of present members whose applications are otherwise acceptable. Enforcement of the verdict was left to the 3-man appointed federal court which originally tried the case. The AP on September 7 filed a petition for rehearing, contending that the court order harms the small newspapers by hindering,

rather than fostering, competition. On October 8, the Supreme Court, without comment, denied the petition for a rehearing.

Ernie Pyle, popular war correspondent and hero of the doughboy soldier, was killed by a Japanese sniper on the tiny isle of Ie near Okinawa on April 18. His column, filled with names and human interest, was syndicated in more than 400 papers. Pyle was caught in an ambush en route to the front.

The toll of American war correspondents and photographers rose to 38. The roll of those killed by enemy action included: Jack Frankish, United Press, from bombs in Belgium during the battle of the bulge in late December, and Joseph Morton, Associated Press reporter, shot to death by the Germans in Slovakia on Jan. 24, 1945. Only correspondent known to have met such a fate in this conflict, Morton had left Italy with a military mission which went into enemy territory to rescue American airmen.

Recipients of the Purple Heart for being wounded in line of duty included Keith Wheeler, Chicago *Times* correspondent, and Charles H. McMurty, Associated Press. Joseph McDonald, United Press, captured on Wake Island, was liberated from a Japanese prison camp in Manila.

A heart attack April 18 ended the career of Joseph V. Connolly, president of International News Service and King Features Syndicates. Other publishers of note who died included: Victor H. Hanson, Birmingham *News Age-Herald*, a founder of the Southern Newspaper Publishers Association, March 8; Maj. J. E. Crown, crusading editor of the *New Orleans States*, January 13 and Silas Bent, author and reporter, July 30.

Moses Koenigsberg, organizer of King Features Syndicate, named for himself in Anglicization of Koenig, died September 21, of a heart attack. He resigned as head of Hearst newspaper organizations in 1928. He championed a plan for a free press throughout the world which was presented to the League of Nations experts in 1927.

Robert T. Bellaire, first Allied correspondent killed in the Pacific area since the Japanese surrender, died September 30, in Japan of injuries received in a jeep accident. Bellaire represented the United Press in Tokyo before the war, was interned, and returned to the United States on the *Gripsholm* in the summer of 1944.

Ace reporter of the Associated Press, Kirke Simpson, who wrote the story on the burial of the Unknown Soldier at Arlington Cemetery in 1921, retired in July as did John L. Meyer, Chicago, manager and secretary of the Inland Daily Press Association.

Three representatives of the American Society of Newspaper Editors, Wilbur S. Forrest, assistant editor of the New York *Herald-Tribune*, Ralph E. McGill, editor of the Atlanta, Ga., *Constitution*, and Dean Carl Ackerman of Columbia University School of Journalism, completed in June a 40,000 mile global trip visiting 11 Allied and neutral countries and 22 major world capitals to spread the message of worldwide press freedom as a requisite of world peace. They reported that almost all governments were in favor of incorporating free press clauses in the peace treaty.

Carrier strikes deprived most of the millions of New York City and all of the St. Louisans of their newspapers for three weeks in mid-summer. Papers continued to be printed in New York but could not be delivered. Lines blocks

long formed daily at all newspaper offices except *PM*, which was not affected. In St. Louis the carriers struck for a lower contract price and the Printers' Union refused to cross picket lines. The strike ended when the publishers bought the routes and the carriers became employees and thus entitled to collective bargaining. The 1945 union laws of the International Typographical Union, reserving the right to the executive council to strike if blanket endorsement was not in the contract to union rules of employment, caused long strikes on the Jersey City *Journal* and the Bayonne (N.J.) *Times*, and shorter ones on the San Antonio *News* and the Uniontown (Pa.) *Standard*. The St. Louis C.I.O. Guild published six issues of the St. Louis *Daily News* during the strike.

Pulitzer Prize winners were: for distinguished service by a newspaper, the Detroit *Free Press* for an exposé of legislative graft in the state capital; editorial writing, George W. Potter, Providence (R.I.) *Journal-Bulletin*; war correspondence, Harold V. Boyle, Associated Press; best cartoonist, Sgt. Bill Mauldin, United Feature Syndicate; distinguished reporting on international affairs, Mark S. Watson, Baltimore *Sun*; telegraphic reporting on national affairs, John B. Reston, the New York *Times*; general reporting, Jack S. McDowell, San Francisco *Call-Bulletin*. For his memorable picture of the marines raising the flag on Mt. Suribachi, Iwo Jima, Joe Rosenthal, AP still-pool photographer, was cited.

Steady and continuous support was given to war loan campaigns and salvage drives of all types. The Office of War Information, headed by Elmer Davis, formally closed September 15. *Yank*, colorful news-magazine of the armed services, ceased publication Dec. 28, 1945.

While total advertising for the first eight months was down .9 per cent from the corresponding time in 1944, continued increases since V-E Day, especially in the retail field, had overcome earlier losses. ANPA (American Newspaper Publishers' Association) membership reached an all-time high of 740.

The American Society of Journalism School Administrators was organized with Dr. P. I. Reed, West Virginia University journalism director, as president. A plan for the accreditation of the United States journalism-training institutions by an authority representing the press and the American Association of Schools of Journalism was announced early in May.

Heads of leading organizations in journalism are: American Newspaper Publishers' Association, William G. Chandler, Scripps-Howard papers; Inland Daily Press Association, Don Anderson, Madison, (Wis.) *State Journal*; American Association of Schools and Departments of Journalism, Max R. Grossman, Boston University; Sigma Delta Chi, Willard R. Smith, Chicago, Ill.; and National Editorial Association, C. L. Ryder.

EUGENE W. SHARP,
School of Journalism, University of Missouri.

JOYCE, William, war criminal: b. Brooklyn, N.Y., April 24, 1906. William Joyce, alias Lord Haw Haw, broadcast throughout the Second World War for German Propaganda Minister Joseph Goebbels, his object, the undermining of British morale. Far from achieving his purpose, he was highly valued by his British and American radio audiences as an entertainer. Joyce was educated in Ireland and at the University of London. In 1933, he was a member of Sir Oswald Mosley's British Fascist organization; in

1937, he broke with Mosley, and established his own National Socialist League. He went to Germany on Aug. 25, 1939. On May 29, 1945, he was captured by British soldiers at Lüneburg, Germany, and on June 18, went before London's chief metropolitan magistrate, charged with high treason. Despite the fact that he proved his American citizenship in an effort to escape the penalties of British law, Joyce was sentenced on

Sept. 19, 1945, to be hanged for treason. (He was executed Jan. 3, 1946.) He was convicted on the charge of "adhering to the King's enemies by broadcasting propaganda between Sept. 18, 1939, and July 2, 1940, while owing allegiance to the King." The court ruled that he was subject to British justice because, in times past, he had claimed the privileges and protection of a British passport.

K

KAISER, Georg, German playwright: b. Magdeburg, Germany, Nov. 25, 1878; d. Ascona, Switzerland, June 5, 1945. A dramatist of social vision who employed an advanced modern technique that secured him recognition as one of the leaders of the expressionist school, Kaiser wrote plays that were almost uniformly successful, both artistically and commercially. His first drama, a satiric comedy, *Rektor Kleist*, was written when he was 25 years old, but his plays did not reach the stage for another 10 years. His best known works include *Die Jüdische Witwe* (1911); *König Hahnrei* (1913); the pseudo-historical drama, *Die Bürger von Calais* (1914); *Von Morgens bis Mitternachts* (1916), a moving drama of the futility of modern civilization, which was produced by the Theater Guild in New York in 1922 under the title *From Morn to Midnight*; *Die Sorina* (1917); *Die Versuchung* (1917); *Gas* (in 2 parts, 1918; 1920), which bitterly denounced the industrial system and pleaded for man's emancipation from the tyranny of the machine; *Die Koralle* (1918); *Der Brand im Opernhaus* (1918); *Hölle, Weg, Erde* (1919); *Die Flucht nach Venedig* (1923); *Nebeneinander* (1923); *Kolportage* (1924); *Zweimal Oliver* (1926); *Gats* (1928); *Zwei Krawatten* (1929); and *Mississippi* (1931).

KALISH, Max, American sculptor: b. Poland, March 1, 1891; d. New York City, March 18, 1945. Kalish first won fame with his statues of American working men; more recently he had given much of his time to making statuette portraits and small bronze figures. Among his subjects have been Lily Pons, John Charles Thomas, Jonas Lie, Joseph P. Day, Dr. John F. Erdmann, and others. His statuettes of "Fifty Great Men of 1944," including that of the late President Roosevelt, were on exhibition at the Smithsonian Institution in Washington at the time of his death.

Brought to the United States in childhood, Kalish was educated in the Cleveland public schools. He studied sculpture at the Cleveland School of Art (1906-10); the National Academy of Design in New York (1910-12); and at the Académie Colorossi and the École des Beaux-Arts, Paris, (1912-14). He held the position of associate sculptor at the Panama-Pacific International Exposition in San Francisco (1913-15), and lectured at Western Reserve University from 1929 to 1932.

Among Kalish's important works are a bronze figure of Christ (1926), and a heroic figure of Lincoln which he made for the city of Cleveland in 1927. His works are included in the National

Gallery of Arts, the Cleveland Museum of Art, the Newark Museum of Art, and other collections. Kalish was an associate National Academician and a member of the National Sculpture Society.

KAMEROON. See CAMEROONS; CAMEROUN.

KAMIKAZE. Japanese suicide plane, loaded with high explosives, designed to destroy floating targets by crash-diving into them. "Kamikaze" in Japanese means "divine wind," as the typhoon was called which allegedly destroyed the Mongolian invasion fleet of Kublai Khan off Japan. According to the not always reliable reports of Marco Polo, who presented the Mongolian version of the story, a Mongol fleet of between 4,000 and 6,000 barges, manned by about 35 soldiers each, set out to subdue Japan in 1281, following the conquest of China and Korea. It was dispersed and mostly destroyed by the storm before reaching the Japanese coast. According to the Japanese tradition, no more reliable than Marco Polo, Kublai Khan's amphibious forces tried to invade Japan twice, in 1274 and 1281, but were repulsed at the beaches by Japanese warriors led by Shik-ken (Regent) Hōjō Tokimune. Their fleets were supposed to have been destroyed by raging typhoons on their inglorious homeward voyage. The first Japanese airplane to fly around the world, on a trip sponsored by the Tokyo newspaper *Asahi Shimbun*, was christened *Kamikaze*. Its exploits aroused a chauvinistic frenzy in Japan and made the name a symbol of a flier's heroism.

There were two widely different kinds of Kamikaze. The older type used comparatively early in the Pacific theater of the Second World War, was either a medium bomber or a fighter plane, stripped of guns, armor, et cetera, and loaded to the maneuverable limit with explosives to be ignited by bomb fuses when hitting the target. The pilot was not locked into the cockpit, but he had no parachute, and was certain to be killed by the explosion. He could hardly attempt to save his life by returning without having crash-dived, for even a normal landing would almost certainly lead to an explosion. The first type of plane to be converted into a Kamikaze was the Mitsubishi O-1 bomber, nicknamed Betty 22 by the Americans; the second, a low-winged modern fighter plane, referred to as the Frank I by American airmen. The size of the planes and their lack of armor made them highly vulnerable to antiaircraft fire. This fact and the relatively high cost of production led to the development of another type of Kamikaze used for the first time in the battle for Okinawa. Americans referred to it as the "Baka" bomb—Baka in Japanese mean-

ing "stupid." The Japanese called it "Jinray" (Pearl of Thunder).

The Jinray was a maneuverable and manned version of the German V-1 flying bomb. It was carried by a Mitsubishi bomber of the Betty 22 (O-1) type, suspended under the latter's fuselage. When in sight of the target, the Jinray was released as the bomber turned away to escape AA (ack-ack) fire. After an initial glide, the pilot switched on rockets that gave the missile a speed of about 500 miles an hour. Although the pilot was not locked into this type of Kamikaze either, he had no parachute and the bomb had no landing gear. Maneuvering to avoid anti-aircraft fire, the pilot, in his last dive, aimed at his target through a sight resembling that of an AA machine gun. He was supposed to select only big ships as targets, aircraft carriers if possible, and to attempt to crash at the most vulnerable part of the vessel. If the pilot missed the target, he was doomed to dive into the sea, as the Jinray could not pull out of a power dive.

The Jinray had a fuselage length of 19 feet 10 inches and a wingspan of 16 feet 5 inches. The fuselage was of metal construction, with wings, rudders, and elevators of plywood. The warhead contained 2,645 pounds of tri-nitro-anisol, a very powerful explosive, ignited by a fuse in the nose of the bomb. The sight, on the rear of the warhead, faced a cockpit protected by $\frac{5}{16}$ of an inch of armor. Behind the cockpit were a small oxygen tank and three rocket motors equipped with three rockets each. Rudder and elevators were the same as on a normal airplane. The range of the Jinray was short and it was bound to crash dive soon after its release. The power of penetration of the flying bomb, speeding at 500 miles an hour, came close to that of the heaviest naval artillery shell. Despite its armor, however, the Jinray proved highly vulnerable to AA fire.

A special corps of Kamikaze fliers was given thorough training in Japan. At times the Japanese boasted of scores of thousands of young men eager to join the suicide squads. Exact figures remained undisclosed. A large number of Kamikaze fliers were supposed to have been husbanded for the defense of the Japanese home islands against the final Allied invasion.

Despite considerable damage done to the Allied fleet off Okinawa and some losses suffered in other zones through Kamikaze fliers, the effect of the weapon did not come up to exaggerated Japanese expectations. Relatively few capital ships were hit by the Kamikazes and most of them survived and could be repaired. The moral effect desired by the Japanese did not materialize either, since the Allies were not intimidated by suicidal tactics. The Kamikaze can hardly be considered a practical "weapon of the future." See also under WORLD WAR, SECOND—*Conquest of Okinawa*.

ERWIN CH. LESSNER,

Author of Phantom Victory; Blitzkrieg and Bluff.

KANSAS. West North Central state, United States; admitted to the Union Jan. 29, 1861. Population (1940): rural, 1,047,087; urban, 753,941; total, 1,801,028. Land area, 82,113 square miles, divided into 105 counties. Chief cities, with 1940 populations: Kansas City, 121,458; Wichita, 114,966; Topeka, the capital, 67,833; Hutchinson, 30,013; Salina, 21,073; Leavenworth, 19,220.

Chief State Officers, 1945.—Governor, Andrew F. Schoepel; lieutenant governor, Jess C. Denious; secretary of state, Frank J. Ryan; treasurer,

Elmer T. Beck; auditor, George Robb; attorney general, A. B. Mitchell.

Judiciary.—Chief justice of the state supreme court, W. W. Harvey; associate justices, William A. Smith, Walter G. Thiele, Hugo T. Wedell, Homer Hock, Jay S. Parker, Allan B. Burch.

Legislature.—The state legislature (Senate, 40 members; House of Representatives, 125) convenes biennially in odd years on the second Tuesday in January.

Education.—Public elementary schools (at last report), 6,414; teachers, 10,149; pupils, 251,929. Public junior high schools, 98; teachers, 981; public senior high schools, 696; teachers, 4,485; total number of junior and senior high school students, 99,441. Teacher training schools, 3; teachers, 300; students, 2,240. The University of Kansas, Lawrence, and Kansas State College, Manhattan, receive financial aid from the state. Education is compulsory for all children between the ages of 6 and 16, inclusive.

Finances.—Following is a statement of Kansas' finances for the fiscal year 1944-45, supplied by the state treasurer's office:

Balance in treasury, beginning of fiscal year 1944-45	\$ 84,288,694.81
Receipts, 1944-45	90,731,887.78
Total	\$175,020,582.59
Disbursements, 1944-45	75,821,352.15
Balance, beginning of fiscal year 1945-46	\$ 99,199,230.44

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.)	45,090	114,793	69,828
Oats (1,000 bu.)	37,770	28,098	21,090
Wheat (1,000 bu.)	133,791	191,669	214,679
Barley (1,000 bu.)	10,294	14,348	6,948
Rye (1,000 bu.)	809	987	880
Sorghums for grain (1,000 bu.)	11,406	49,468	15,600
Flaxseed (1,000 bu.) ..	855	452	522
Hay:			
Alfalfa (1,000 tons) ..	1,000	1,661	1,562
Tame (1,000 tons) ..	1,274	1,955	1,809
Wild (1,000 tons) ..	600	780	742
Soybeans for beans (1,000 bu.)	605	3,315	2,612
Sweet potatoes (1,000 bu.) ..	327	406	418
Tobacco (1,000 lb.)	277	300	270
Potatoes (1,000 bu.)	2,279	1,144	1,580
Apples (1,000 bu.)	735	279	279
Peaches (1,000 bu.)	87	15	63
Pears (1,000 bu.)	131	63	112
Grapes (tons)	2,640	3,300	4,300

KEANE, Doris, American actress: b. Michigan, Dec. 12, 1881; d. New York City, Nov. 25, 1945. Miss Keane scored one of the greatest of modern theatrical triumphs in New York and London as Margherita Cavallini in Edward Sheldon's *Romance*, which opened at the Maxine Elliott Theater, New York City, on Feb. 10, 1913. Privately educated in Chicago, New York, and Paris, Miss Keane then studied at the American Academy of Dramatic Art in New York. She made her debut on the stage as Rose in *White-washing Julia* at the Garrick Theater, New York, on Dec. 2, 1903. In 1904 she supported John Drew in *Delancy* and three years later she made

her first London appearance in *The Hypocrites*. Save for two brief absences because of illness, Miss Keane played 1,049 consecutive performances in *Romance* in London, where the play opened in 1915. After a time, Basil Sydney, an English actor, took the leading male role in the play and toward the close of the London run, in 1918, they were married. This marriage ended in divorce in 1925. Miss Keane was seen in a revival of *Romance* at the Playhouse, New York, in 1921, and at the Playhouse, London, in 1926. She toured England the next year and also appeared in a silent motion picture version of the play. Although she later starred in *Roxana* (1918), *Romeo and Juliet* (1919), *The Czarina* (1922), and *Starlight* (1925), she never had another success like *Romance*. Her last appearance was in 1929 at the Belasco Theater, Los Angeles, in *The Pirate*.

KEMMERER, Edwin Walter, American economist: b. Scranton, Pa., June 29, 1875; d. Princeton, N.J., Dec. 16, 1945. One of the world's greatest exponents of monetary theory and a strong defender of the gold standard, Dr. Kemmerer had been called upon by 14 governments for advice in reorganizing their monetary systems. Starting in 1903 with a visit to the Philippine Islands, he subsequently served as financial adviser to the Straits Settlements, Egypt, Mexico (1917), Guatemala (1919), Colombia (1923; 1930), the Union of South Africa (1924-25), Chile (1925), Poland (1926), Ecuador (1926-27), Bolivia (1927), China (1929), Peru (1931), and Turkey (1934).

Working his way through Wesleyan University, he was graduated in 1899 and won a fellowship for graduate study in economics and finance at Cornell University, where he took his doctorate of philosophy in 1903. He was instructor in economics and history at Purdue University (1901-03); assistant professor of political economy at Cornell University (1906-09); and a professor at Cornell from 1909 to 1912. In 1912 he went to Princeton as professor of economics and finance, a post he held until 1928 when he was elevated to the Walker chair in international finance and to the post of director of the international finance section of the university. He retired in June 1943. Dr. Kemmerer served as a currency and banking expert to the Dawes Committee when it drew up the so-called Dawes plan for handling German reparation payments in 1925. He had been managing editor of the *Economic Bulletin* (1907-10); president of the American Economic Association (1926); and president of the Economists' National Committee on Monetary Policy (since 1937). Dr. Kemmerer was the author of many books, the best known being *The ABC of the Federal Reserve System* (1918).

KENNEY, George Churchill, United States Army Air Force officer: b. Yarmouth, Nova Scotia, Aug. 6, 1889. From June 1944, General Kenney commanded the Far East Air Force, under the overall command of Gen. Douglas MacArthur. Kenney's air force lent support to MacArthur's invasion of Leyte in the Philippines on Oct. 20, 1944, and the landings on Luzon in early January 1945.

General Kenney was sent to the Pacific theater in July 1942, when he replaced Gen. George H.

Brett as MacArthur's air commander. An able and ingenious leader, his first achievement in the Pacific was the sending of an airborne United States regiment to the relief of the Allies in New Guinea, making possible the Australian drive across the Owen Stanley Mountains. He devised and perfected several unusual and effective methods of aerial warfare, among them the deadly art of skip-bombing, which in March 1943 cost the Japanese 10 warships and 12 troop transports in the battle of the Bismarck Sea. In September of the previous year, he directed the employment for the first time of a co-ordinated aerial attack on an enemy-occupied airfield near Buna, New Guinea, using instantaneous fuze parachute bombs dropped from extremely low altitudes.

General Kenney became an army flier in June 1917 when he enlisted in the aviation section of the Signal Corps Reserve. He was commissioned first lieutenant November 1917, and sailed for France where he began advanced flight training at the 3d Aviation Instruction Center at Issoudun. Thereafter, he served first with the French Eighth Army; later with the American First and Third. He was awarded the Distinguished Service Cross for heroism in action near Jametz, France, on Oct. 9, 1918, and was also awarded the Silver Star for bravery. In June 1926, he graduated from the Air Corps Tactical School; in June 1927, from the Command and General Staff School; and from the Army War College in June 1933. From February to April 1939, General Kenney was air corps observer with the navy during fleet and marine exercises in the Caribbean; during this period, he made a complete survey of possible airdrome locations in Puerto Rico and the Virgin Islands, selecting sites now being used as military airbases. From February to May 1940, he was assistant attaché for air in Paris, observing tactical operations on the Franco-German front and studying technical developments made in military aircraft and equipment by both sides. As a result of his studies, a number of improvements were made in American military aircraft fully a year prior to America's entry into the Second World War.

General Kenney holds the Distinguished Flying Cross, the oak leaf cluster to his Distinguished Service Cross, the Purple Heart, and the Distinguished Service Medal. He is an honorary knight commander of the military division of the Order of the British Empire. He was promoted full general (temporary) in March 1945.

KENTUCKY. East South Central state, United States; admitted to the Union June 1, 1792. Population (1940): rural, 1,996,300; urban, 849,327; total 2,845,627. Land area, 40,109 square miles, divided into 120 counties. Chief cities, with 1940 populations: Louisville, 319,077; Covington, 62,018; Lexington, 49,304; Paducah, 33,765; Newport, 30,631; Owensboro, 30,245; Ashland, 29,537; Bowling Green, 14,585; Frankfort, the capital, 11,492.

Chief State Officers, 1945.—Governor, Simeon S. Willis; lieutenant governor, Kenneth H. Tuggle; secretary of state, Charles K. O'Connell; treasurer, Thomas W. Vinson; commissioner of finance, Clarence Miller; attorney general, Eldon S. Dummitt.

Judiciary.—Chief justice of Kentucky's Court of Appeals, Henry Johnson Tilford; associate judges, Porter Sims, William H. Rees, James W. Cam-

mack, Jr., William Augustus Thomas, Clyde B. Latimer, E. Poe Harris.

Legislature.—The state's General Assembly (Senate, 38 members; House of Representatives, 100) convenes biennially in even years on the first Tuesday after the first Monday in January.

Education.—Public elementary schools (1944-45), 5,785; teachers, 12,813; pupils, 451,742; average yearly salary of elementary school teachers, \$984. Public junior and senior high schools, 907; teachers, 4,897; students, 79,343; average yearly salary of junior and senior high school teachers, \$1,456. Education in Kentucky is compulsory for children between the ages of 7 and 16, inclusive. Total state appropriation for common school education (1944-45), \$15,000,000; appropriation by cities and counties (1944-45), \$20,000,000. Superintendent of public instruction, John Fred Williams.

Finances.—The following figures concerning state finances for the fiscal year 1942-43 are the latest available:

Balance in treasury, beginning of fiscal year 1942-43	\$ 9,350,650.59
Receipts, all sources, 1942-43	32,767,943.66
Total	\$42,118,594.25
Disbursements, 1942-43	28,615,693.68
Balance, beginning of fiscal year 1943-44	\$13,502,900.57

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.)	66,321	67,080	77,130
Oats (1,000 bu.)	1,434	1,538	1,909
Wheat (1,000 bu.)	5,975	7,902	5,872
Barley (1,000 bu.)	1,250	1,932	1,462
Rye (1,000 bu.)	183	616	858
Hay:			
Alfalfa (1,000 tons)	297	346	499
Clover and timothy (1,000 tons)	317	313	547
Tame (1,000 tons)	1,688	1,601	2,336
Soybeans for beans (1,000 bu.)	375	780	975
Sweet potatoes (1,000 bu.)	1,503	1,440	1,440
Tobacco (1,000 lb.)	296,820	477,020	445,379
Potatoes (1,000 bu.)	3,605	2,494	4,257
Apples (1,000 bu.)	285	185	262
Peaches (1,000 bu.)	619	878	1,273
Pears (1,000 bu.)	223	135	256
Grapes (tons)	2,030	1,900	1,000

KENYA COLONY AND PROTECTORATE. See BRITISH EAST AFRICA.

KERN, Jerome David, American composer: b. New York, Jan. 27, 1885; d. there, Nov. 11, 1945. Dean of America's show music composers, Jerome Kern was rated by critics with Victor Herbert in the field of musical theater, and his *Show Boat* (1927) was often described as the best operetta written by an American. During a period of 40 years he was credited with a total of 104 stage and screen vehicles containing his melodies. Fifteen of these were reported to have passed the 2,000,000 mark in record sales. Among his best known songs are *Ol' Man River*, *Look for the Silver Lining*, *Smoke Gets in Your Eyes*, *Why Do I Love You?*, *They Didn't Believe Me*, *The Way You Look Tonight*, and *The Last Time I Saw Paris*.

Mr. Kern's first association with music came through his mother, who taught him to play the piano. After graduating from Newark (New Jersey) High School, where he regularly played the organ at assembly and directed a students' musical show, Kern took courses at the New York College of Music with Alexander Lambert

and Paolo Gallico. He had additional lessons in theory and harmony with Dr. Austin Pierce and Albert von Doenhoff, and studied privately with tutors in Germany in 1904-05. His first New York job was with the Lyceum Music Publishing Company, as a pianist and song-plugger at \$7 a week. Later he took a job with T. B. Harms and Company, music publishers, and eventually became vice president of the firm. He began as a composer in England in 1903, but it was not until seven years later that *Mr. Wix of Wickham*, his first musical show, was given its première in New York. In 1911 he did music for *The Red Petticoat*, and later wrote musical scores for *Very Good Eddie* (1915); *Ziegfeld Follies* (1916); *Have a Heart* (1917); *Oh Boy* (1917); *Rock-a-Bye Baby* (1918); *Sally* (1920); *Stepping Stones* (1923); *Sunny* (1925); and numerous other shows. In 1927 he collaborated with Oscar Hammerstein, 2d on an operetta derived from Edna Ferber's novel, *Show Boat*. Later musical shows for which he composed songs were *Sweet Adeline* (1929), *The Cat and the Fiddle* (1931), *Music in the Air* (1932), *Roberta* (1933), and *Very Warm for May* (1939). In 1930 he went to Hollywood where he wrote the music for the films, *Men of the Sky* (1930); *I Dream Too Much* (1935); *Swing Time* (1936); *When You're in Love* (1937); *The Joy of Living* (1938); *One Night in the Tropics* (1940); *You Were Never Lovelier* (1942); and *Can't Help Singing* (1945). In 1941 Artur Rodzinski conducted the Cleveland Symphony Orchestra in the world première of Kern's *Show Boat: A Scenario for Orchestra*, and the next year Andre Kostelanetz led the Cincinnati Symphony in the first performance of his *Mark Twain: A Portrait for Orchestra*.

KESSELRING, Albert, German Army officer: b. 1887. Field Marshal Kesselring was the last supreme commander of German armies in the west. In April 1945, one month after he replaced Field Marshal Karl von Rundstedt in that post, his command was divided, and he directed operations south of the Leipzig area. On May 9, announcement was made of his capture by the American Seventh Army. Kesselring had previously commanded Nazi forces in Italy, and is generally credited with the extraordinary stand made there in 1944 and the early weeks of 1945. Son of a government inspector of schools, he began his military career as a pilot in the First World War. His rise to prominence was speeded materially by his friendship with Hermann Göring, and by 1936, he was first chief of the Luftwaffe's general staff. He later relinquished this post in protest against opposition to his plans for air operations, and it was not until February 1939 that he returned to favor as commander of Air Fleet I. In September 1939, he directed air force operations between Danzig and Brest-Litovsk during the Polish campaign, and in May 1940, sent German bombers over the Netherlands, Belgium, and France as commander of Air Fleet II in the northern sector of the western front. He was promoted general field marshal in June, and thereafter, took part in the Battle of Britain. His presence as Nazi commander in Italy in 1944 was revealed in Italian dispatches in mid-August, reporting he had been "grievously wounded by his own officers," and again in November Bern reports stated he had suffered serious injuries.

KINDERGARTEN ASSOCIATION, National. This association, in the year ended July 30, 1945, secured the establishment of 67 new kindergartens

under properly qualified teachers; continued its attempts to arouse interest among the leaders of many state organizations to obtain enactment of better kindergarten laws with the result that in several instances improved legislation resulted; and assisted parents in solving child behavior problems through its home education articles, which are being sent to 922 publications that agreed to print them. The articles are used also by 773 home demonstration agents, and have been requested by 32 countries. They are sent free of charge. The association is supported by voluntary contributions and bequests. There are four types of membership: honorary (\$1,000); life (\$100); sustaining (\$25); and just plain memberships (\$10). Publications include weekly home education articles, and various leaflets. Officers as of July 30, 1945, included Maj. Bradley Martin, president; Eversley Childs, Jr., treasurer; and Miss Bessie Locke, executive secretary. Miss Florence Jane Owens is editor. Headquarters: 8 West 40th Street, New York 18, N.Y.

KING, Ernest Joseph, United States naval officer: b. Lorain, Ohio, Nov. 23, 1878. Admiral King was named commander in chief of the United States Fleet in December 1941, when the Pearl Harbor attack made it imperative to consolidate all United States naval forces under one commander, and in March 1942, he assumed additional duties as chief of naval operations. He played a prominent role in military and naval conferences on American-British war strategy in 1943 and 1944. His planning is credited with having reduced Japanese naval power to a negligible factor in the Pacific war in the latter year. He attended the Potsdam Conference, July 17-Aug. 2, 1945. In October, the executive orders establishing the office of commander in chief, United States Fleet, (COMINCH) and combining it with the office of chief of naval operations were revoked by President Truman. Admiral King, however, continued to serve as chief of naval operations until his successor, Fleet Admiral Chester W. Nimitz, took over. Admiral Nimitz was designated for the post on November 20, but did not assume office until December. (Admiral King, past the statutory retirement age of 64, had expressed a desire to step down as operations chief, and had submitted his resignation after V-J Day.)

Admiral King was graduated from the United States Naval Academy (1901), fourth in his class. In the First World War, he was a member of the staff of the commander in chief of the U. S. Atlantic Fleet, eventually the fleet's assistant chief of staff. From September 1923 to July 1926, he commanded the Submarine Base at New London, Conn., and while on this duty, was in charge of raising the U.S.S. S-51, sunk off Block Island, Sept. 25, 1925. He handled this undertaking with such success that he was detailed in December 1927 to command the force which raised the U.S.S. S-4, rammed and sunk off Provincetown, Mass. For the first of these achievements, he was awarded the Distinguished Service Medal, to which was added a gold star in lieu of a second DSM for his work in salvaging the S-4. In June 1927, Admiral King qualified as a naval aviator, after flight training at Pensacola, Fla., and from August 1928 to August 1929, was assistant chief of the Bureau of Aeronautics. There followed tours of duty as commander of the Naval Air Station, Norfolk, Va.; commanding officer of the U.S.S. *Lexington*; and chief of the Bureau of Aeronautics, April 1933-June 1936,

with the rank of rear admiral. From 1938-39, as vice admiral, he commanded the Aircraft Battle Force, United States Fleet; was a member of the general board of the Navy Department, 1939-40; and commander in chief, U. S. Atlantic Fleet, February-December 1941. His navy rank, admiral of the fleet, was authorized in December 1944.

KINKAID, Thomas Cassin, United States naval officer: b. Hanover, N.H., April 3, 1888. Admiral Kinkaid commanded the United States Seventh Fleet for the final months of the Pacific War, and lent naval support to all Gen. Douglas MacArthur's major operational landings—in the Admiralties, Hollandia, the Philippines, and Borneo. On Oct. 24, 1944, his Seventh Fleet, with Admiral Halsey's Third Fleet, dealt the Japanese Navy its death blow in the battle of Leyte Gulf, definitely sinking 24 enemy ships and scoring hits on an additional 58. In mid-November, 1945, the Pacific war at an end, announcement was made of Admiral Kinkaid's appointment to succeed Admiral Royall Ingersoll as commander of the Western Sea Frontier, with headquarters at San Francisco, Calif. Admiral Kinkaid is a veteran of the battles of the Coral Sea, May 4-8, 1942, and of the Solomon Islands, Aug. 24, 1942. In August 1943, as commander of United States naval forces in the North Pacific and chief of combined military operations in that area, he scored a third victory over the Japanese with an unopposed landing on Kiska, one-time Japanese-held island in the Aleutians. He was transferred from the North Pacific in October 1943, and ordered to General MacArthur's Southwest Pacific Command; in late November, he assumed command of Allied naval forces in that theater. A graduate of the United States Naval Academy (1908), he was gunnery officer aboard the U.S.S. *Arizona* in the latter months of the First World War. From November 1938 until March 1941, he was naval attaché and naval attaché for air at the American embassy in Rome, with additional duty from March 1939 as naval attaché at Belgrade, Yugoslavia. With Italy's declaration of war on France, he returned to the Navy Department, and from March to December 1941, was attached to the Office of the Chief of Naval Operations. After the Pearl Harbor attack, he went immediately to the Pacific theater where he assumed command of a cruiser division. In October 1942, he became commander, Cruisers, Pacific Fleet. Admiral Kinkaid's service medals include the Distinguished Service Medal; two gold stars in lieu of second and third DSM's; the Presidential Unit Citation ribbon awarded personnel of the U.S.S. *Enterprise*, his flagship during part of the Pacific operations; the Victory Medal, Atlantic Fleet Clasp; and the American Defense Service Medal.

KIRGHIZ SOVIET SOCIALIST REPUBLIC. See UNION OF SOVIET SOCIALIST REPUBLICS.

KLAIPEDA (MEMEL). Port on the Baltic Sea, and strip of territory extending from the port up the right bank of the River Nemunas (Niemen, Memel), the port constituting Lithuania's only natural sea outlet. Area of the territory (1940), 1,081 square miles; population, mainly Lithuanians, 153,000. Population of the port of Klaipeda, approximately 50,000. Detached from Germany by the Treaty of Versailles, the territory of Memel became in May 1924 (under an Allied convention), a unit within the sovereignty of Lithuania. In March 1939, under threat of

force by Hitler, it was surrendered by Lithuania to Germany. The Germans agreed to permit Lithuania a free port zone in Memel harbor. Overrun by the Germans in their drive to the east in June 1941, on Oct. 23, 1944, the territory of Memel was reported recaptured by the Red Armies, although the Germans still retained the port. On Jan. 28, 1945, Soviet forces recaptured the port, which with its territory, now became part of the Lithuanian Soviet Socialist Republic, under the name of Klaipeda.

KNIGHTS OF COLUMBUS. This fraternal benefit society was incorporated by the State of Connecticut March 29, 1882. Its purposes include the rendering of aid to members and beneficiaries of members, the promotion and rendering of educational, charitable, religious, social welfare and public relief services. Benefits totaling over \$65,000,000 have been paid to members and beneficiaries. There are two types of membership—insurance and associate. On June 30, 1945, insurance members numbered 224,142; associate members numbered 312,782, making the total membership 536,924. Over 80,000 members of the organization are serving or have served in the Second World War and approximately \$25,000,000 of its funds are invested in the bonds of the United States and Canadian governments. It publishes *Columbia*, a monthly magazine. The 1945 annual meeting was held August 21-23 at Montreal, Canada. Officers include Francis P. Matthews, supreme knight, and Joseph F. Lamb, supreme secretary. Headquarters: 45 Wall Street, New Haven, Conn.

KNIGHTS OF PYTHIAS. A fraternal organization of white males with lodges in the United States, Canada, and the Hawaiian Islands; founded in Washington, D.C., Feb. 19, 1864, and chartered by special act of Congress. Its cardinal principles are friendship, charity, and benevolence. Its influences are for morality, education, and obedience to law, but it seeks to shape no creed. The order has a military department and three other recognized auxiliaries: the Pythian Sisters, Dramatic Order Knights of Khorassan, and Princes of Syracuse. The order is a great mutual relief corporation. It maintains 16 Pythian homes for aged members and their wives, widows, and children. During the year ended Dec. 31, 1944, \$438,000 was expended for relief. The total membership is now a quarter of a million. The 1946 Supreme Lodge convention will be held in Tulsa, Okla. Officers for the present biennial term are: Charles J. Schuck, supreme chancellor, Wheeling, W.Va.; Willard M. Kent, supreme vice chancellor, Ithaca, N.Y.; Dr. Archie B. Jackson, supreme prelate, Jefferson City, Mo.; Mel M. Ewen, supreme keeper of records and seal, 1054 Midland Bank Building, Minneapolis, Minn.; Richard L. Meares, supreme master of exchequer, Indianapolis, Ind.; F. Duncan Meade, supreme master at arms, Calgary, Alberta, Canada; Fred L. Sylvester, supreme inner guard, South Portland, Me.; Oscar G. Brenneman, Harrisburg, Pa.

KNOBLOCK, Edward, Anglo-American playwright, scenarist, and novelist: b. New York City, April 7, 1874; d. London, England, July 19, 1945. One of the leading playwrights in Great Britain, Edward Knoblock achieved his first great success with *Kismet* in 1911. Graduating from Harvard University in 1896, Mr. Knoblock gained his first experience as an actor in London and became a British subject. During

the First World War, he served as an intelligence officer in Greece. He wrote his first play, *The Club Baby*, with Lawrence Sterner in 1895, and turned out new plays and adaptations at the rate almost one a year from then until 1935. Among his plays are *The Faun* (1911); *My Lady's Dress* (1914); *Marie-Odile* (1915); *Tiger, Tiger* (1918); *The Lullaby* (1923); *The Mulberry Bush* (1930); *Grand Hotel* (1931; from the novel by Vicki Baum); *Rolling Stone* (1936); and *Bird of Passage* (1943). He collaborated with Arnold Bennett on the plays, *Milestones* (1912), *London Life* (1924), and *Mr. Prohack* (1927); with J. B. Priestley on the dramatization of *The Good Companions* (1931); with A. J. Cronin on *Hatter's Castle* (1932); with Beverley Nichols on *Evensong* (1932); and with V. Sackville West on *The Edwardians* (1934). He wrote the movie scenarios for the Douglas Fairbanks pictures, *The Three Musketeers* (1921), and *The Thief of Bagdad* (1923), and other films. His autobiography, *Round the Room*, was published in 1939.

KNUBEL, Frederick Hermann, American clergyman: b. New York City, May 22, 1870; d. New Rochelle, N.Y., Oct. 16, 1945. Under the leadership of Rev. Dr. Knubel, president of the United Lutheran Church in America from its formation in 1918 until January 1945, this organization grew from a membership of some 800,000, when it was formed by the merger of the General Synod, the General Council, and the United Synod of the Lutheran Church in the South, to a present membership of 1,400,000 confirmed members.

KONEV, Ivan S., Soviet Army officer: b. 1897. Marshal Konev, 49-year-old commander of the First Ukrainian Army for the 1945 Russian offensive against Germany from the east, was born in Ladeino (Podosinovskii District, the Archangel Region) of a peasant family. For a time he attended the village school, then at the age of 12 went to work as a lumberjack. He was called to service with the Imperial Army in the spring of 1916, and was ordered to the Tarnopol front the next year. In the February Revolution, he sided with the Bolsheviks; helped effect the confiscation of church and landowners' property in his native district in late November 1917; and organized the district's first Congress of Soviets. In May and June of 1918, he was delegate to the 5th All-Union Congress of Soviets. Konev entered the Red Army in 1919, and subsequently saw action against Semenov bands and the Japanese in the Soviet's Far Eastern Republic. In 1922, he became military commissar of the People's Revolutionary Army Staff, and two years later, was a corps commissar. In 1925, he began studies in Moscow, and with their completion in 1926, he was named commander and commissar of a rifle regiment. He was a member of the highest branch of the Communist Party, the All-Union Central Executive Committee, from 1931-34. In the latter year, he was graduated from Frunze Military Academy with highest honors, and given a rifle division command. He was appointed commander of the Second Far Eastern Army stationed at Khabarovsk in September 1938, and in June 1940, was promoted lieutenant general. Shortly after the German attack on Russia in 1941, Konev became one of Timoshenko's most valued assistants, and directed tank force operations against the German general, Heinz Guderian, on the Moscow front. In August 1942, while the bitter struggle for Stalingrad was at its height, Konev and Zhukov

launched the Soviet drive on the front west of Moscow. Twelve months later, Konev was one of the generals chosen to command the Soviet push on Orel and Belgorod, and his troops helped stifle the brief flareup of the German offensive, the last attempted on Russian soil. His army later took part in the liberation of Kharkov, second Ukrainian capital. In February 1944, the German Eighth Army (the remnants of 10 divisions) was annihilated on the bank of the Dnepr (Dnepr) River in the Ukraine, west of Cherkassy; this was the work of Konev and the late Gen. Nikolai Vatutin. After this operation, Konev was given Russia's highest military title, marshal of the Soviet Union. On March 19 troops of his Second Ukrainian Army crossed into Bessarabia, and by March 26, had driven the Germans back to the southern line from which they started their invasion in 1941. For the Soviet offensive of January 1945, Marshal Konev commanded troops of the First Ukrainian Army; on May 2, his forces, with those of Marshal Zhukov's First White Russian Army, completed the occupation of the German capital of Berlin, fourth largest city in the world. Marshal Konev's military decorations include the orders of the Red Star, the Red Banner, Lenin, Suvorov (1st degree), and Kutuzov (1st degree); in April 1945, he received the Red Army's highest award, the Order of Victory.

KONOYE, PRINCE Fumimaro, Japanese statesman: b. Tokyo, October 1891; committed suicide there, Dec. 15, 1945. Three times premier of Japan, Prince Konoye has been named a war criminal in the list issued by General MacArthur on December 6. Taking poison on the eve of his surrender to Allied authorities, he left a note in which he confessed: "I have been most gravely concerned with the fact I have committed certain errors in the handling of state affairs since the outbreak of the China incident. I cannot, however, stand the humiliation of being apprehended and tried by an American court."

Born of one of Japan's oldest and most distinguished families, Prince Konoye was educated at Tokyo College and Kyoto Imperial University, where he was graduated with a law degree in 1917. He then became a member of the non-regular home ministry, and attended the Paris Peace Conference in 1919 as one of Prince Saionji's secretaries. Back in Japan, he took his hereditary seat in the House of Peers, and from 1933 to 1937 served as president of that body. In 1934, after the Manchurian incident had disrupted Japanese-American relations, he was sent to the United States on a goodwill tour, and two years later he refused the offer of the premiership. However, as an independent nonparty aristocrat, he became premier on June 3, 1937, and formed a national union Cabinet. A month later the undeclared Sino-Japanese War broke out near Peiping (Peking). On Jan. 4, 1939, he resigned as a result of the army's demand for greater control of the Japanese economic system. Subsequently, he served as minister of state without portfolio and as president of the Privy Council. On July 23, 1940, he was named premier for a second time and commanded by the emperor to form a new government. He effected a drastic Cabinet shake-up and organized his new "national party" along fascist lines. On August 1, his government announced that it would pursue a totalitarian policy which would include Japanese domination over Asia. During his tenure, the Burma Road was closed by the British, French

Indo-China was invaded, the Rome-Berlin-Tokyo pact was signed, and relations with the United States over control of the Pacific became strained. On July 16, 1941, his Cabinet resigned, and two days later he returned to his post as premier and reshuffled his Cabinet. The third Konoye government lasted only until Oct. 16, 1941, when he resigned because of disagreement among ministers "concerning the manner of executing national policy." Lieut. Gen. Hideki Tojo, war minister in the Konoye Cabinet and admitted representative of Japanese militarists, then became premier. After the American occupation of Japan, Prince Konoye came briefly to the fore because of his undertaking to write a new democratic Japanese constitution. Early in November, however, Allied headquarters made it known indirectly that he and his commission no longer figured in moves being made to set up a new fundamental law for the country.

KOREA. A country of eastern Asia, independent until annexed in 1910 by the Japanese, to whom it was known as **CHOSŌN**. Restoration of independence "in due course" was pledged by leaders of the United Nations in the Cairo Declaration of Dec. 1, 1943. The area is 85,246 square miles, and the population (1940 census) 24,326,327; Japanese constitute less than 3 per cent of the people. Seoul (Keijo) is the capital (pop. 706,396), and other large cities are Pusan (Fusan), 249,734; Pyeng-Yang (Heijo), 185,419; Taegu (Taikyū), 110,866; and Chemulpho (Jinsen), 102,473. Estimated ordinary revenue for 1941-42 was 732,544,000 yen, and expenditure 551,787,000 yen; public debt as of March 1938 was 593,646,215 yen. Primary schools (1939) were 9,695 (6,029 privately established), with 1,107,954 pupils (203,086 in those privately established). Teaching of the Korean language was abolished in 1940; instruction in Japanese is compulsory. Half of secondary school pupils (70,000) were Japanese; at Seoul University were 350 Japanese and 206 Korean students. American and British missionary colleges educated 4,000 students. Korea, primarily agricultural, has 3,000,000 farms on 11,000,000 acres. Much of the rice produced (106,775,869 bushels in 1940) goes to Japan; other crops are millet, beans, barley, potatoes, and vegetables. Cotton is cultivated (157,752,637 pounds in 1940), and silkworms reared (22,713,000 kilos of cocoons in 1940). Livestock included (1939) cattle, 1,705,000; hogs, 1,400,000; horses, 51,000; and sheep, 20,000. Fishing (catch in 1939 valued at 151,090,000 yen) increases in importance. Principal minerals are gold, iron, coal and graphite; others include lead, mica, molybdenum, wolfram and zinc. Manufactured products (in 1942 valued at 2,700,000,000 yen) comprise chemicals (31 per cent of the total value), foods and beverages (24 per cent), textiles (14 per cent) and metals (8 per cent). Principal chemical product was sulphate of ammonia; foods and beverages included wines and liquors, soy, *misŏ* (bean paste), flour, candy, starch, and refined sugar; textiles comprised cotton goods and woven silk, rayon and fiber; and metal industries were chiefly the production of steel, aluminum and magnesium, shipbuilding, and electrical apparatus. In 1941 there were 3,524 miles of railroads and 19,000 miles of highways. The Korean provisional government at Chungking, though not recognized by any government, declared war against Germany on Feb. 28, 1945. The Tokyo radio reported on April 1 that Korea had been granted

representation in the Japanese Diet. On June 8, Acting Secretary of State Joseph C. Grew declared that the United States government policy, "that in due course Korea shall become free and independent," was still in force.

KORNGOLD, Julius K., Austrian music critic: b. Brno (Brünn), Moravia (now part of Czechoslovakia), Dec. 24, 1860; d. Hollywood, Calif., Sept. 25, 1945. Dr. Korngold studied law before making music his profession. From 1902 to 1934 he served as music critic of the Vienna *Neue Freie Presse* and was credited with the discovery of several noted musicians, among them Artur Schnabel, Erica Morini, and Nathan Milstein. When Hitler invaded Austria, Korngold came to the United States in 1938 to join his son, Erich Wolfgang Korngold, who has been active in Hollywood as a composer for the films. Dr. Korngold published several volumes of essays on contemporary opera.

KROFTA, Kamil, Czech diplomat and statesman: b. 1876; d. Vraz Sanatorium, Czechoslovakia, Aug. 18, 1945. Czechoslovak minister of foreign affairs from March 1936 to October 1938, Dr. Krofta carried on the democratic anti-Nazi policy of President Beneš, whom he succeeded as foreign minister and whose right-hand man he was, until after the Munich agreement, when he was ousted in an effort to improve relations with Germany and Italy and to please dissident Slovaks. Educated at the universities of Prague and Vienna, Dr. Krofta served first as professor of history and later as professor of the history of religion at the University of Prague until 1920, when he entered the diplomatic service. In 1921, he was appointed minister to the Holy See, then minister to Austria (1922-25); and minister to Germany (1925-27). From 1927 to 1936 he was undersecretary of state for foreign affairs. As minister of foreign affairs, Dr. Krofta strengthened the Little Entente, opposed the demands of the Sudeten Germans for autonomy, and insisted on the validity of Czechoslovakia's alliance with France and her pact with Russia. Distinguished as a scholar, he was the author of many books, notably *A Short History of Czechoslovakia* (1934), written in English. Shortly before his death, Dr. Krofta had been released from a Nazi concentration camp.

KRUEGER, Walter, United States Army officer: b. Flatow, West Prussia, Jan. 26, 1881. General Krueger commanded the American Sixth Army for General MacArthur's return to the Philippines by way of Leyte, Oct. 20, 1944, and for the later invasion of Luzon, largest of the Philippine islands, Jan. 9, 1945. He was assigned to the Sixth Army command in February 1943 at the request of General MacArthur.

One of the most thoroughly educated men in the United States Army, General Krueger has explored almost the entire military training system, either as student or instructor, and is a graduate of the Infantry-Cavalry School (1906); the Command and General Staff School (1907); General Staff College, Langres, France (1918); Army War College (1921); Naval War College (1926); and the Air Corps Primary Flying School (1927).

Walter Krueger was brought to the United States at the age of eight years. A student in the Technical High School, Cincinnati, at the outbreak of the Spanish American War, he left school to enlist in June 1898. He served in Cuba as a noncommissioned officer until mustered out of the volunteer service in February 1899. He

re-enlisted in the Regular Army four months later, and in 1901, was commissioned second lieutenant in the infantry, after service on Luzon during the Philippine Insurrection. There followed, after 1903, a period of service in the states before he returned to the Philippines as a topographical inspector in charge of mapping the islands. Few men are more familiar with the military features of the Philippines than General Krueger. In the First World War, he saw action in France with the 26th Division, later with the Tank Corps, AEF. After the war, he held a variety of posts, administrative and otherwise, at army camps and schools throughout the country. In October 1940, he assumed command of the 8th Army Corps at Fort Sam Houston, Texas; in May 1941, of the Third Army, with headquarters at San Antonio, Texas, a post he held until ordered overseas with the Sixth in early 1943.

General Krueger holds the Distinguished Service Medal, the Order of the Aztec Eagle, (Mexico), and the Legion of Merit, awarded him in 1943 for his service as chief of the American Third. He was promoted a full general (temporary) in March 1945.

KURIA MURIA ISLANDS. See ARABIA.

KURILE ISLANDS. A chain of 32 islands and many rocks, (ceded by Russia to Japan in 1875), and stretching for a distance of nearly 750 miles, between the Kamchatka Peninsula, and Hokkaido, northernmost island of Japan proper; total area, 3,994 square miles. They are known to the Japanese as the Chishima Islands and are relatively unimportant economically.

Bombing raids on the Kuriles by United States planes, begun in July 1943, were frequent and intense throughout 1944, reaching Paramushiro, main northern stronghold of the Kurile group, Shimushu, Onnekotan, Matsuwa, and Shashikotan also in the northern Kuriles, and Shimushiri and Ketoi, only about 400 miles from Japan proper. On Sept. 1, 1945 it was announced that Russia's Far Eastern armies had completed occupation of the Kuriles.

KUWAIT. See ARABIA.

KWANGCHOWAN. See FRENCH INDO-CHINA.

KWANTUNG. The southern portion of the Liaotung Peninsula in Manchuria (with Port Arthur, which the Japanese called Ryojun, near its southernmost tip), which before the Russo-Japanese War (1904-05) had been leased by China to Russia, and was subsequently leased to Japan. Under the Sino-Soviet agreement of Aug. 14, 1945, it is to be restored, as part of Manchuria, to China; but Dairen, as terminus of the South Manchurian Railway, is to be under joint control of the two powers signing the agreement, and Port Arthur is to be used by both powers as a naval base. (See MANCHURIA for further details.) The Kwantung area is about 1,438 square miles in extent, and according to Japanese estimates had in 1935 a population of 1,656,726, including 1,009,970 Chinese and 174,587 Japanese. Until the Japanese surrender, in August-September 1945, Kwantung was administered by a governor general, whose headquarters was Dairen. For the Japanese, representing less than 11 per cent of the population, school facilities were reported (at the end of 1936) for 63,214, or 36 per cent. Of the other 89 per cent of the population, including over 1,000,000 Chinese, only 57,516, or less than 4 per cent were at school. The estimated budget for 1938-39, in which revenues balanced expenditures, was 23,021,204 yen. Ag-

ricultural products include Indian corn, millet, beans, wheat, buckwheat, rice, tobacco, hemp, and vegetables. Fishing is important. Salt is the leading manufactured product. Dairen has an excellent harbor, ice-free throughout the year, and

under the Sino-Soviet agreement is to be free to the shipping of all nations.

Kwantung, as here described, is not to be confused with the province of Kwantung in southern China.

L

LABOR CONDITIONS IN THE UNITED STATES.

The last year of the war was in many respects the peak year of labor's participation in the war. Total employment in July 1945 was smaller than in July 1944, but because of increases in military personnel and reductions in the civilian labor force, unemployment remained approximately the same. Few important changes occurred in wages, in consumers' prices, or in wartime controls of manpower, wages, and prices. The surrender of Japan, however, was followed by a sharp decline and rapid shifting of employment, the curtailment of hours and of average earnings, the removal of manpower controls, modifications of the controls of wages and prices, the ending of the pledge against strikes and lockouts, and an outburst of industrial disputes centering largely about demands for wage increases.

Reconversion plans were dislocated by the unexpectedly short interval between the defeat of Germany and the surrender of Japan. An important reconversion plan affecting labor was the proposed extension, by means of federal aid, of unemployment benefits to war workers not covered or covered inadequately by state systems, together with the granting of travel aid to war workers in their return to their homes or their transportation to other places where jobs could be obtained. The major long-term plan affecting labor was embodied in the Full Employment Bill. On these measures no final action had been taken by Congress up to November 9.

In spite of the wartime subordination of normal collective bargaining to emergency controls, unions continued to extend the area of collective agreements. Labor's interest in problems of an international nature was reflected in demands for a voice in the peace settlements and in a movement (supported by the CIO and opposed by the AFL) to reorganize international trade unionism on a more comprehensive basis that would include, in particular, the CIO and the labor organizations of the Soviet Union.

Various proposals were made for the strengthening of the Department of Labor and the unification under the department of various labor functions performed by other agencies. Special emphasis was given to the strengthening of the Conciliation Service for aiding in the settlement of industrial disputes on a voluntary basis under collective bargaining after the war. Initial steps included the transfer, on September 19, of the War Manpower Commission and the National War Labor Board to the Department of Labor. A labor-management conference was called to meet in November to consider industrial relations after the lapse of the wartime pledge against strikes and lockouts.

Employment and Unemployment.—The passing of the peak of war production, combined with

improved techniques of production, caused a continued decline in factory employment. The number of wage earners and salaried employees combined in manufacturing establishments was smaller by 1,559,000 in June 1945 than in June 1944. The tentative beginning of reconversion was reflected in a rise of 154,000 in the number of construction employees. The number of employees in all nonagricultural establishments fell from 38,846,000 to 37,549,000, a decline of 1,297,000.

The employment of production workers (substantially equivalent to wage earners) fell off sharply, especially in war industries, the number in aircraft, aircraft engines, and shipbuilding alone being reduced by almost 700,000 between June 1944 and June 1945. The number in bituminous-coal mining fell from 356,000 to 331,000, following earlier declines, the average for 1939 being 371,000. The number of hired farm workers underwent little change during the year, although the June 1945 employment of 2,357,000 was significantly smaller than the 3,099,000 employed in June 1939. The effects of contract cancellations after V-J Day were reflected at once in a decline of 1,600,000 (11 per cent) in the number of factory workers between July 31 and August 31. The largest reductions were in aircraft (51 per cent) and shipbuilding (20 per cent).

Labor turnover figures for manufacturing industries also indicate the downward trend of employment. The accessions rate in June 1945 was 59 per 1,000, as compared with 76 per 1,000 in June, 1944, a reduction of 22 per cent. The discharge rate and the quit rate underwent little change but the lay-off rate rose from 50 to 170 per 1,000.

The unprecedented shift of workers from industry to industry and from region to region, as indicated earlier in the war by percentages of increase in employment, was reflected during the current year in varying rates of decrease. Figures of factory employment in metropolitan areas show that between June 1944 and June 1945 only 2 of these areas (Des Moines, Iowa, and El Paso, Texas) experienced increases in employment. The reductions in employment ranged as high as 37.9 per cent, in the Jacksonville, Fla., area, and several other metropolitan areas also experienced declines of 25 per cent or more. Shifts in the industrial composition of employment may be illustrated by the declines of 36 per cent in shipbuilding, 31 per cent in aircraft engines, and 29 per cent in aircraft, small increases in various manufacturing industries, including fertilizers and petroleum refining, and a rise of 36 per cent in new non-federal construction projects.

Estimates of the total civilian labor force (including both the employed and the unemployed) throw light on the immediate effects

of the ending of the war. Between the week ending August 11 and the week ending September 8, the decrease in employment was about 2,270,000. The increase in unemployment was about 820,000, the civilian labor force declining, during the same period, by about 1,450,000 because of withdrawals of students and others from the labor market.

Reconversion Employment Problems and Policies.—Reductions in employment up to June 1945 caused little net unemployment because of the continued shortage of workers in many industries and areas. The situation changed suddenly, however, with the surrender of Japan, and plans made for gradual reconversion were either abandoned or adapted as far as possible to meet the new conditions. Main reliance was placed on a program of removing unnecessary restrictions on production and employment and the flow of materials for the purpose of speeding the transition to production for civilian use, but the removal of restrictions was combined with a policy of retaining control of the flow of certain scarce materials and of continuing basic controls of prices, wages, and rationing to an extent deemed essential for preventing inflation.

The easing of manpower controls had begun before the end of the war, largely on the basis of adjustments by area manpower officials to facilitate the transfer of workers to meet reconversion needs whenever this would not interfere with war production. On August 14 a reconversion program was announced for a general removal of war manpower controls, including the compulsory 48-hour workweek, and for adapting the facilities of the organization to the re-employment of displaced workers in civilian industries.

The declines in employment resulting from the completion or cancellation of war contracts did not necessarily mean equivalent increases in unemployment, because it was expected that many workers would no longer seek employment after the end of the emergency wartime demand for workers. It was estimated, for example, by the War Manpower Commission, that between 4 million and 5 million boys and girls of high-school age had been employed in stores and factories and on farms. The commission, together with the Children's Bureau and the Office of Education, sponsored a nationwide back-to-school drive primarily in the interest of education but incidentally for the purpose of employing displaced adult workers and returning veterans.

One of the problems of reconversion employment rose from the different interpretations of the re-employment rights of veterans. The director of Selective Service interpreted the Selective Training and Service Act as giving to a returning veteran who meets the re-employment conditions prescribed by law an absolute right to be restored to his former position or a position of like seniority, status, and pay. This interpretation was held by the unions to be a "superseniority" that would tend to destroy the long-established systems of seniority prevailing in numerous industries, systems which, it was held, returning veterans as workers were interested in maintaining. A somewhat similar view was held by many employers. The board of directors of the Chamber of Commerce of the United States asserted that the requirement of absolute reinstatement would result in great inequity and "the complete disruption of employ-

ment relations as contained in collective bargaining contracts."

The president, in messages to Congress on May 28 and September 26, urged the immediate enactment of a bill providing for supplemental employment benefits in the form of compensation payments up to \$25 per week for a period as long as 26 weeks. Special unemployment assistance had already been granted to demobilized veterans for as long a period as 52 weeks. More than 15 million workers were unprotected by existing unemployment insurance laws, and many of those covered were given inadequate protection. The unprotected workers included war workers employed by the federal government in navy yards, arsenals, and government offices. Proposals were also made in Congress for providing financial assistance in the form of travel expenses to displaced workers who had left their homes to engage in war work.

The movement of workers into war industries and the beginnings of the reverse movement gave special significance to detailed state and regional statistics of employment, hours, and earnings. A program for supplying such information was developed by the Bureau of Labor Statistics in co-operation with other agencies.

Planning for Full Employment.—The unexpectedly short interval between the end of the war in Europe and the defeat of Japan prevented the carrying into effect of some of the plans for dealing with employment during the reconversion period. It became apparent that serious reconversion unemployment would be unavoidable.

Full employment beyond the reconversion period became the chief long-run objective of domestic policy. This goal was reflected in the emphasis given to the problem and the commitments made by party leaders in the 1944 election campaign. It also found expression in the reports of the director of the Office of War Mobilization and Reconversion, as well as in other official reports; in the formation of a Commerce-Labor Interdepartmental Committee on Full Employment; in studies issued and programs formulated by private organizations, including labor unions, the Committee for Economic Development, and the National Planning Association; and in widespread discussion by the general public. The effects of different types of domestic full employment programs on the foreign trade of the United States were explored by the Interdepartmental Executive Committee on Economic Foreign Policy. In adopting the charter of the United Nations Organization at San Francisco the United States and other nations accepted an obligation "to take joint and separate action in co-operation with the organization to achieve . . . full employment."

The chief center of public interest in this problem, however, was the Full Employment Bill of 1945, introduced in the Senate on Jan. 22, 1945, and later in the House. This bill proposed that the president submit annually to Congress a national production and employment budget. This budget would contain estimates of the total volume of expenditures by major types required to maintain full employment and the extent to which, if at all, actual expenditures might be expected to fall short of that amount. Whenever a "prospective deficiency in the national budget" is to be expected, the president, under the bill, would formulate broad programs for stimulating private and other non-federal expenditures; and if these were viewed as insufficient, he would submit further programs

of federal expenditures such as might be viewed as necessary to assure full employment. If the estimated normal expenditures should exceed the amount deemed necessary to maintain full employment, the president would propose taxation or other measures designed to restrain spending and thereby to prevent inflation. A congressional joint committee on the national budget was proposed, to receive and study the national budget message of the president and to make findings and recommendations designed to serve as a guide in the formulation of full employment policies. The bill was significant primarily not in providing actual assurance of full employment but rather in its acceptance of the principle of public responsibility, combined with its attempt to establish a tentative procedure for handling the problem.

Occupational Readjustments.—The war profoundly changed the occupational structure of the American economy. Industrial skills and experiences were diversified and enriched by the war; but because these changes arose from the special demands of a war-centered economy, a lack of occupational balance is to be expected after the war between the skills required by postwar jobs and the trained labor supply. To many individuals this means a difficult readjustment; to society, a major problem of educational planning.

The war accentuated prewar trends towards an increasing proportion of operatives (semi-skilled workers), clerical workers, and managerial occupations. It accentuated prewar trends toward decreasing proportions of farmers, farm laborers, and unskilled workers in industry. It reversed prewar trends toward a proportionate increase in the numbers of professional, sales, and personal service workers. It boosted sharply the ratio of skilled workers—a group which had constituted a fairly constant proportion of the labor force for the preceding three decades. From the point of view of peacetime needs, disproportionate numbers of the 15 million men and women who served in the armed forces received training in technical skills, such as the aviation and radio occupations.

Equally significant with these net changes in the numbers employed at different types of jobs were the changes experienced by individuals in particular occupations. The labor demands of a strained economy gave people a better chance to find work at their highest levels of skill. Hiring standards were generally lowered and advancement was more rapid, resulting in a general advance in the occupational status of individuals. Large numbers of women learned semi-skilled occupations in factories, clerical, and managerial work. Negroes made significant gains in fields in which their numbers had previously been relatively small, such as semi-skilled occupations in industry.

The postwar return to the long-term trends of peacetime occupational demands was expected to intensify competition not only for jobs at those higher levels of skill for which the war created an oversupply of trained workers but for many other jobs as well. Thus, it was apparent that thousands of welders, metal-working machine operators, aircraft pilots and mechanics, radio and electronic equipment technicians, and persons with similar skills would have to seek other types of jobs. At the same time, relative shortages were expected in such occupations as those of physicians, civil engineers, teachers, skilled construction workers,

sales personnel, and personal service workers. Studies of these conditions and trends, undertaken by the Department of Labor, were designed to facilitate educational planning and individual readjustments.

Hours of Work.—One of the noteworthy differences in trends during the First and Second World wars was in hours of work. The average factory workweek declined from 49.4 hours in 1914 to 46.3 in 1919, but rose sharply after 1939, from 37.7 hours in that year to 45.2 in 1944. In hours of work as well as in number of workers, employment in war production passed its peak in 1944. In manufacturing the average fell slightly from 45.4 hours per week in June 1944 to 44.6 hours in June 1945. The reductions were predominantly in the durable-goods industries and were particularly noteworthy in some of the industries connected with war production. In the durable-goods industries there were decreases in 52 of the 65 industries reporting to the Bureau of Labor Statistics, in contrast to increases in almost one half of the nondurable-goods industries. Reductions occurred in only 2 of the 14 nonmanufacturing industries reporting to the Bureau of Labor Statistics and these two (retail trade and the telegraph industry) showed only slight declines. Estimates of hours worked by all nonagricultural employees (including the self-employed) indicate a decline similar to the reduction of hours in manufacturing industries, the estimated general average falling from 45.7 hours in June 1944 to 44.6 hours in June 1945.

The concept of working time in mining underwent a significant change during 1944 and 1945. The union agreement in the bituminous-coal industry, adopted late in 1943 and approved by the National War Labor Board in May 1944, provided for the inclusion of travel time in the mine as compensable time. Following this precedent, and conforming to the Supreme Court decisions of March 1944 relating to iron mining and of May 1945 relating to coal, the 1945 anthracite agreement contained a similar provision.

The slight declines in average hours up to June 1945 were primarily a result of cutbacks in war production, accompanied by increases in labor turnover and part time. The ending of the compulsory 48-hour week after the defeat of Japan, the rapid cancellation of war contracts, and the desire of employers to reduce the amount of premium payments for overtime were factors which became effective for the most part after June. The normal work schedule in most employments before the war was 40 hours, and the end of the war was expected to cause a widespread reversion to the 40-hour scheduled workweek. The sharp curtailment of the earnings of industrial workers resulting from the cutting down of the workweek and the elimination of premium payments for overtime was a major factor in the efforts of unions to obtain adjustments of wage rates.

The hours of federal employees, with few exceptions, were reduced in July to 44 per week, and after the defeat of Japan, the basic 40-hour week (in place of the prewar 39-hour week) was adopted in most agencies, in accord with the Federal Employees Pay Act of 1945. The addition of an hour to the normal workweek of federal employees was accompanied by the 5-day week.

Average Weekly Earnings.—The average weekly earnings of factory workers continued the war-

time advance during 1944, rising from \$46.24 in June 1944 to \$47.50 in January 1945. A decline followed, the June 1945 average being \$46.32. The reductions were largely, as in the case of weekly hours, in the durable-goods industries. Increases occurred in all of the non-manufacturing industries reporting to the Bureau of Labor Statistics, and also in railroad transportation. The average for railroad employees rose from \$44.98 in May 1944 to \$45.91 in May 1945.

The large increases in earnings during the war came about in considerable part as a result of temporary factors such as increased hours, premium payments for overtime, shifts of workers to high-wage employments, and upgrading. The cutting down of earnings by the reversion to prewar hours (normally the scheduled 40-hour week), the decline of employment in such high-wage industries as shipbuilding, and the reclassification and downgrading of workers created serious problems of reduced earnings, problems which became increasingly acute after the defeat of Japan. A considerable part of the earlier increases in weekly earnings had been counterbalanced by increases in prices and by such conditions as the disappearance of low-priced goods, deterioration of quality, and difficulties of marketing conditions, especially in war production centers.

The problem of declining weekly earnings was the more serious because the weekly wage was no longer a measure of "take-home" pay. It was estimated by the Bureau of Labor Statistics that as a result of pay-roll deductions for taxes and bonds a factory worker earning the average gross weekly wage of \$46.32 in June 1945, before any considerable reductions in earnings occurred, received only \$39.64 if he had three dependents, and if without dependents, only \$33.87.

Average Hourly Earnings.—The average hourly earnings of factory workers rose from \$1.017 in June 1944 to \$1.046 in January 1945 but fell thereafter to \$1.038 in June 1945. The increases occurred mainly in the nondurable-goods industries, which as a whole showed a rise of 5.2 per cent in hourly earnings during the year, as compared with an increase of only 1.5 per cent in the durable-goods industries. Hourly earnings declined in a few of the durable-goods industries but in none of the nondurable-goods industries. Similarly, all of the nonmanufacturing industries reporting to the Bureau of Labor Statistics underwent some increases in hourly earnings. The relatively large increases in nondurable-goods industries and nonmanufacturing industries followed a wartime lag of wages in many of these industries.

Premium payments for overtime, the shift of workers from low-wage to high-wage industries, and other factors in addition to changes in basic rates of wages continued to find reflection in average hourly earnings. The estimated straight time hourly earnings of factory workers in June 1945 averaged \$0.969, in contrast to the gross average of \$1.038. When the effects of the interindustry shifts of workers during the war as well as the effects of premium payments for overtime are eliminated, factory hourly earnings in June 1945 averaged \$0.905. Premium overtime payments had undergone little decline as a proportion of gross hourly earnings, but the effect of the wartime shift of workers to high-wage industries was receding with the reductions of employment in war industries.

Wage Rates.—The wartime increases in basic wage rates were much smaller than were the increases in average earnings. The gross average hourly earnings of factory workers rose 53 per cent from January 1941 to April 1945. Factory hourly earnings adjusted for eliminating the effects of premium payments for overtime and of interindustry shifts in employment advanced 39 per cent. The estimated rise of urban wage rates in manufacturing during the same period was 32 per cent. A relatively small part of the increase in rates occurred after October 1942, and the rise from October 1944 to April 1945 was only 1.6 per cent.

Basic wage-rate increases in most of the non-manufacturing industries were larger than in manufacturing, as is indicated by the following tabulation:

	Per cent of increase in wage rates from—	
	April 1944 to Oct. 1944	Oct. 1944 to April 1945
Manufacturing	2.2	1.6
Wholesale trade	2.9	1.5
Retail trade	5.7	4.6
Finance, insurance, and real estate	1.6	4.5
Local utilities3	1.5
Service trades	5.4	3.2

The relatively large increases in nonmanufacturing industries and in ordinary civilian-goods industries in the manufacturing group were contrary to trends in these industries during the earlier period of the war. The reversal of the trend is significant as indicating the passing of the peak of the demand for workers in war industries and as reflecting an effort on the part of workers to overcome the lag in wages in many fields not connected directly with war production. In addition, the National War Labor Board's policy of approving increases in substandard wages beyond the limits of the Little Steel formula benefited relatively large proportions of workers in these industries.

Farm wages, which had lagged behind non-farm wages before the war, continued a relatively rapid wartime advance. The weighted average farm wage rate was 10 per cent higher in July 1945 than in the same month of the previous year.

The Federal Employees Pay Act of 1945, effective July 1, increased the base pay according to a graduated scale ranging up to 20 per cent in the lower brackets for employees in the classified Civil Service. This was the first increase in basic rates for federal employees during the war. The act also provided for the payment of time and one half when hours worked are more than 40 per week, approved a night-shift differential of 10 per cent of base pay, and shortened the waiting periods for automatic within-grade salary advancements from 18 to 12 months in the lower salaried groups and from 30 to 18 months in the higher salaried groups. The act also provided for bi-weekly instead of semi-monthly pay periods. In July, overtime was generally reduced to 4 hours per week, and after the defeat of Japan it was entirely eliminated for most of the employees of the federal government.

Policies and Proposals Relating to Wages.—Few significant changes occurred in national wage policy before the defeat of Japan. The National War Labor Board continued its program of wage stabilization in general conformity to the Little Steel formula but with minor adaptations, notably in the form of "fringe" adjustments. These were described as changes other

than in basic rates, such as premiums for extra shifts, allowances for vacations, and compensation during sick leave. Increasing attention was paid also by the board to job evaluation and reclassification plans as a means of encouraging balanced wage-rate structures.

A noteworthy change in policy occurred in connection with the stabilization of agricultural wages by the Department of Agriculture and State War Food Administration wage boards. A large increase occurred in the number of orders establishing wage ceilings in particular localities for specified types of farm labor, especially in the Western states. The policy was continued after the defeat of Japan, as for example, by an order of September 14 establishing wage ceilings for cotton picking and pulling in the Delta Area of Mississippi. No wage "floors" had been established by minimum wage laws for farm workers.

The National War Labor Board, in accord with an executive order of August 18, extended the scope of collective bargaining and permitted voluntary wage increases without its approval when not used to obtain permission to raise price ceilings. The president, in his message to Congress on September 6, recommended the amendment of the Fair Labor Standards Act for raising the 40-cent minimum, which he considered "inadequate when established" and which "has now become obsolete." He recommended also the extension of the act to include additional types of workers such as those engaged in agricultural processing industries. Estimates by the Bureau of Labor Statistics for the summer of 1945 indicated that 20 per cent of factory workers were receiving a straight time hourly wage of less than 65 cents, the proportion in the major industry groups in manufacturing running as high as 58 per cent.

The early stages of reconversion to peacetime production indicated sharp reductions in weekly hours and in the number of workers on extra shifts, with accompanying declines in hourly earnings and especially in weekly earnings. In addition, the earnings of many workers and the average earnings of large groups were being reduced by declines in shipbuilding and other industries paying comparatively high wages. Estimates by the Bureau of Labor Statistics of the effects of these changes indicated that if employment and wage rates remained at 1944 levels, the return to prewar hours would reduce wages and salaries by about \$13,000,000,000. On the assumption of the continuance of 1944 wage rates, the shifting of employment away from high-wage industries would cause an estimated reduction of about \$5,600,000,000 in total wages and salaries. Even the reduction of extra-shift premium payments would bring about a decline, it was estimated, of about \$500,000,000.

Labor organizations were substantially in agreement in demanding increases in basic rates of wages to offset the reductions in weekly earnings resulting from such changes as those just mentioned. The arguments advanced by the unions in support of these proposals included the view that technological changes and advances in labor productivity, combined with the elimination of premium payments for overtime, would make possible substantial increases in basic rates without increases in unit labor cost. Wage-rate increases were also demanded on the ground that the volume of national production and income is vitally affected by the

distribution and flow of income, and that wages should be maintained at high levels as a basis of avoiding an accumulation of unused savings and of maintaining adequate demand for the national product.

The director of War Mobilization and Reconversion, in his second report, April 1, 1945, urged a continuance of the policy of wage and price stabilization but indicated the need for ultimate wage increases. He stated that postwar declines in hours of work without compensating increases in wage rates would reduce earnings and standards of living. Referring to improvements in technology and increases in labor productivity as a basis for postwar advances in rates of wages, he stated: "I feel sure that ultimately, after the war, total take-home pay in the United States will reach the present level."

Technology, Labor Productivity, and Labor Cost.—Wage increases in nonwar industries during the war were limited not only by the wage stabilization program but also by the checking of cost reduction through technological change. The end of the war brought about the prospect of accelerated cost reduction by means of technological changes for economizing the use of both capital and labor.

Productivity in manufacturing industries as measured by average output per man-hour had increased before the war at a rate of more than 3 per cent per year. After 1941, however, war production requirements restricted any extensive installation of new equipment or development of new production techniques to war industries. Moreover, operations in nonwar production were handicapped by the loss of experienced workers to the armed forces and to war industries and by restrictions on production, shortages of materials, and the use of substitute materials. These difficulties were less pronounced during 1944 and early 1945, but they persisted until the close of the war, and man-hour output in these industries remained at approximately the 1941 level.

The war industries, in contrast, made tremendous gains in productivity as volume of output expanded and mass-production methods were adopted. Thus, in the aircraft industry, output per man-hour tripled during the years 1942-44. In the construction of Liberty ships, the number of man-hours required per vessel was cut in half over the same period. The large gains in man-hour output in the war industries resulted both from the adaptation of mass production methods which had been employed in civilian industries before the war and from the development of new techniques. The latter will be of continuing importance for peacetime production. Outstanding technical progress was made in fields most closely associated with war needs, particularly metals, chemicals, and rubber, but a few examples will indicate the postwar significance of wartime changes. Methods of fabricating aluminum and magnesium were greatly improved. New welding techniques were developed which are more nearly automatic, and welding replaced riveting in many types of work, with great savings in labor. Inspection operations were speeded by the use of electronic devices, improved X-ray equipment, and magnetic materials. Marked progress was made in heat treatment of metals and in continuous casting techniques. High quality synthetic rubber was produced in quantity and the difficulties of fabricating the synthetics were overcome. New

methods were developed for the production of high-octane gasoline. Many additional types of plastics were produced.

The close of the war brought the prospect of extremely rapid increases in output per man-hour in civilian manufacturing industries. Manufacturers' plans call for a large amount of new equipment, to meet their accumulated replacement needs and to provide for anticipated expansion of production. In some industries, new production techniques which were on the threshold of application before the war will be introduced. Manufacturing methods which originated in war production will find a variety of applications for peacetime use. Thus, it is likely that productivity will increase rapidly for several years.

Prices and Price Controls.—The consumers' price index for moderate-income families in large cities (formerly called the index of cost of living) increased almost 3 per cent during the year ended June 30, 1945, to reach the highest level since the spring of 1921. Living costs for the average city family were 30.8 per cent higher than in August 1939, the month before the outbreak of war in Europe. In a comparable period during the First World War, consumer prices rose 106 per cent.

Prices of all principal groups in the family budget rose between June 1944 and June 1945. Over the year, food prices increased 4 per cent; clothing, 5.4 per cent; housefurnishings, 5.3 per cent; rent, and fuel, electricity and ice were also slightly higher; and miscellaneous goods and services were almost 2 per cent above June 1944 levels.

Food prices, relatively stable from June 1944 to April 1945, rose sharply during May and June as prices of fresh fruits and vegetables moved upward. Prices paid in June 1945 for eggs and fresh fruits and vegetables were more than 12 per cent higher than in June 1944; prices for meats, particularly fish and chicken, were also somewhat above those of 1944. Meat became practically unobtainable during the spring months of 1945 as shortages that had prevailed since fall became more acute and widespread. However, with the end of the war in Europe, the prospects for larger supplies of meats improved appreciably. By June 1945, the average cost of all food at retail was 51 per cent above August 1939, and only 1.3 per cent lower than in May 1943, the highest level for food prices during the war.

The costs of clothing and housefurnishings purchased by urban families continued to rise as lower and medium-priced items disappeared and stocks of inexpensive apparel were reported at their lowest point. June 1945 marked the 24th consecutive month of advances in clothing costs and the 30th successive month of increases in costs of housefurnishings. Cotton clothing prices increased more than 8 per cent over the year, and wool clothing moved up almost 6 per cent over the same period. Prices for cooking stoves, living room, dining room, and bedroom suites, glassware, and sheets rose from 4 to 8 per cent on the average.

The average family was also paying more for many miscellaneous goods and services in June 1945 than in June 1944. Beauty-shop services and men's haircuts were higher, and costs of medical care and household operation were up, and recreation costs increased 3 per cent, reflecting advances in the prices of newspapers, motion pictures, and tobacco.

Throughout the year, rents remained relatively stable, but the housing shortage was still acute in many areas. By June 1945, rent costs for the city worker had increased less than 4 per cent above their level at the beginning of the war in Europe. Prices for fuel, electricity and ice rose about one half of one per cent over the year, as increases for anthracite and bituminous coal more than offset decreases in the prices of kerosene and ice and lower gas rates in some cities.

The Bureau of Labor Statistics index of wholesale prices, after slight fluctuations in 1943 and 1944, began an upturn in September 1944. The increase from June 1944 to June 1945 was 1.7 per cent. The largest rise in 10 major commodity groups was 4.3 per cent in farm products. A slight downturn of 0.3 per cent occurred in the chemicals group. The increase in the all-commodities index from August 1939 to June 1945 was 41.5 per cent, as compared with a doubling of prices from 1914 to the end of 1918.

Pricing problems and rationing in the reconversion period engaged much of the attention of officials as the end of the war approached. Policies announced on July 24 by the Office of Price Administration and the Office of Economic Stabilization called for removal of price controls if the commodity or service does not enter significantly into cost of living or business costs, if continued control involves administrative difficulties out of proportion to the expected results, and if suspension or exemption does not threaten reconversion or the impairment of effective price control of other items. The policy adopted, it was stated, would so simplify pricing problems as to enable the OPA (Office of Price Administration) to concentrate on crucial items and especially on the setting of prices for civilian goods coming back into production.

The president, in his message to Congress on September 6, gave strong support to the policy of price stabilization during the reconversion period. Prices must be held firmly, he stated, on reconversion items as well as on cost-of-living items. The president pointed to the long-range effects of high output and low unit costs, and urged that this basis of price stabilization be maintained in opposition to a short-range policy designed to insure prices high enough to provide immediate profits over and above the temporarily high costs of production due to initial low volume during reconversion.

Labor Organizations.—Few major changes occurred in labor organizations. The International Chemical Workers Union (AFL) and the Office Employees' International Union (AFL), which had been councils of federal labor unions, were given charters as international unions. The Utility Workers' Union of America (CIO) was formed as a combination of the earlier Utility Workers' Organizing Committee (CIO), the Brotherhood of Consolidated Edison Workers, and other former affiliates of the Independent Utility Workers' Union. The United Railroad Workers of America (CIO) was formed as an organizing committee. The International Typographical Union was reaffiliated with the AFL. Locals of the United Textile Workers (AFL) in the knitted goods industry were transferred to the International Ladies' Garment Workers Union (AFL). The International Air Line Mechanics' Association, formerly unaffiliated, became a part of the United Automobile Workers (CIO). The Aluminum Workers of America

was amalgamated with the United Steel Workers of America (CIO).

Outstanding developments during the war occurred in workers' education under trade union auspices and in the facilities for handling the public relations of labor organizations. An impetus to educational work was the continued growth of union membership, with accentuated problems of assimilating new workers and of developing union leadership. New educational and research departments were created and existing facilities were expanded. Increasing numbers of labor institutes and educational conferences were held. Special training courses were offered and a number of new labor schools came into being. The movement not only for educating union members and other workers but also for handling more effectively the public relations of unions made increasing use of such educational devices as radio broadcasts, films and other visual aids, pamphlets, leaflets, posters, comic strips, art, music, and dramatics. Another phase of the movement was an increasing degree of collaboration with colleges and universities. The political interests of labor organizations found noteworthy expression in the work of the CIO Political Action Committee in the 1944 campaign.

An interesting series of events centered around the proposed reshuffling of international trade union organizations. During the early months of 1945, various unions belonging to the International Federation of Trade Unions took steps to organize a more comprehensive international association that would, in particular, include as members both the trade unions of the Soviet Union and the American CIO. The AFL did not associate itself with these activities. The preliminary organization, established at a conference in London in February 1945, was known as the World Trade Union Congress or the World Federation of Trade Unions. Delegates from constituent unions were chosen for a meeting in Paris in September 1945, to consider a draft constitution, to seek agreement on the nature and functions of the proposed federation, and to explore its role in relation to the network of international organizations and agencies foreshadowed in the Charter of the United Nations Organization.

The international organizations and their constituent members, and also the AFL, acting independently, displayed keen interest in the Security Conference at San Francisco and in the formulation of the United Nations Charter adopted in June. The influence of labor organizations was reflected in some degree in the plan for the establishment of the Economic and Social Council of the United Nations and the provision for bringing into relationships with the United Nations such international agencies as were already in existence, notably the International Labor Organization (ILO). The influence of labor organizations was also apparent in the principles and policies incorporated in the United Nations Charter. These included the promotion of "higher standards of living, full employment, and conditions of economic and social progress and development."

The ILO and the United Nations Organization.—During the year, the activities of the International Labor Organization (ILO) moved at an accelerated tempo. There was no annual conference in this 12-month period, but the stage was set for a series of four international conferences between October 1945 and April 1946.

Plans were also laid for the meeting of international tripartite committees, representing workers, employers, and governments, in certain important industries. The purpose of these committees is to provide additional machinery by means of which the organization can give special attention to the problems of particular industries.

An important part of the work of the governing body of the International Labor Office, of its staff, and of United States Department of Labor officials charged with the responsibility for maintaining liaison, was devoted to consideration of the role to be played by the ILO in the United Nations Organization. In May 1944, the governing body appointed a Committee on Constitutional Questions to deal with this and related matters. At a governing body meeting in January 1945, a statement was adopted affirming the desire of the ILO for association with the contemplated United Nations Organization on terms that would permit it, as a tripartite organization, to do its work most effectively. Members of this committee, and other representatives of the ILO and its secretariat, attended the San Francisco Conference of April-June 1945. Progress was made in clarifying the future place and status of the organization, but definite steps could not be taken until the United Nations Organization itself was actually established. In the meantime, the ILO turned to its peacetime activities with redoubled energy.

In June 1945, Miss Frances Perkins, then Secretary of Labor, made a statement to the governing body, meeting in Quebec, concerning the policy of the United States Government towards the ILO. In part, her statement was as follows:

"And now, I have the opportunity to tell you on this occasion and to assure you of the continuation of the United States policy with regard to the International Labor Organization. President Truman has asked me to come here and to give that assurance on his behalf. He has asked me to say to you that the Government of the United States will continue to take full part in the work of the International Labor Organization and will continue to look to the ILO for leadership, information and guidance on the international plane in the improvement of labor standards and the development of measures to combat poverty everywhere. The President also hopes that the ILO will be able to pursue its activities in co-operative relationship with the proposed general organization of the United Nations, under arrangements providing sufficient autonomy to permit of its putting forth its greatest effort. He noted with pleasure that this same hope had been expressed by the Governing Body at its last meeting in London. It is the settled policy of the United States Government to seek for the ILO a proper place within the framework of the co-ordinated effort of the United Nations; under such arrangements, the President noted, the voices of industry and of labor as expressed through the ILO would continue to be real voices in the determination of world policy in all these matters of life and work."

Collective Bargaining.—Continued progress was made by labor organizations in the extension of collective agreements. As late as January 1942, less than one third of those workers in private industry who were potential members of unions were covered by union agreements. By January 1943 the proportion had risen to more than 40 per cent. Thereafter, progress was less rapid but by the beginning of 1944, approximately 13,750,000 workers, or about 45 per cent of potential union members, were employed under the terms of collective agreements. Most of these were in transportation, mining, construction, and manufacturing.

By January 1945, the number of workers employed under union agreements had risen to more than 14,300,000, comprising approximately 47 per cent of potential union membership. In

manufacturing, about 65 per cent of all production workers were covered, but the proportion varied widely from industry to industry. Hardly more than 10 per cent of the workers in the dairy products industry were covered, in contrast to more than 90 per cent in the aluminum, automobile, basic steel, brewery, fur, glass, men's clothing, rubber, and shipbuilding industries.

Among nonmanufacturing industries, about one third of the workers were covered by union agreements at the beginning of 1945. The covered workers were highly concentrated in certain industries, more than 95 per cent being covered in coal mining, maritime and longshoring work, and railroad transportation, including clerical and supervisory personnel. More than 90 per cent of the employees in iron mining and the telegraph industry were covered by collective agreements. In service occupations, nearly 25 per cent were covered, and in clerical and professional work, not quite 20 per cent. In manufacturing, financial, and business service establishments, and in wholesale and retail trade, only about 13 per cent of the clerical and professional employees were under agreement, in contrast to a major portion in transportation, communications, and public utilities and nearly all professional actors and musicians.

Industrial Disputes.—Estimates for the first six months of 1945 indicate 2,310 strikes and lockouts, involving about 1,250,000 workers and about 6,580,000 man-days of idleness. The number of man-days of idleness was equivalent to 0.15 per cent of the estimated available working time. The percentage in the year 1944 was 0.9, and in the year 1943 the same as in the first 6 months of 1945. The number of stoppages in the first 6 months of 1945 showed a slight reduction from the number in the same period of 1944 and a slight increase over the number in the same period of 1943. Stoppages were somewhat longer during the first 6 months of 1945 (5.3 days of idleness per worker involved) than in the year 1944, when the man-days idle averaged 4.1 per worker, but shorter than in 1943, when the average was 6.8 days per worker.

Wage questions in both 1944 and the first half of 1945 were the major issues. These included demands for increased rates and disputes over such questions as the application or operation of incentive systems, overtime rates, and the adjustment of individual rates. Many groups of workers were confronted with a larger increase in consumers' prices than in the wage rates that had been permitted under the national stabilization program. Second only to wage issues were disputes over intraplant working conditions and policies. These included such questions as discipline, job security, work load, physical conditions and hazards, work schedules, shift arrangements, and the duties and organizational rights of supervisors. Problems connected with the status of workers during reconversion to civilian production became increasingly important.

The no-strike and no-lockout pledge made by leaders of labor and industry soon after Pearl Harbor continued in effect during the year. In general, this pledge was faithfully kept. Nearly all of the strikes were spontaneous and unauthorized stoppages and in most cases union leaders used their influence to terminate the stoppages with a minimum of loss of time while the issues in dispute were being settled by ne-

gotiations between the parties or were being handled by government agencies. The conclusion of the war brought to an end the pledge against strikes and lockouts, and the number and seriousness of disputes tended to increase. Major questions related to the reclassification and status of workers in civilian production and the reduction of earnings resulting from reclassifications, shortening of work schedules, and the shifting of workers to industries and occupations paying lower rates of wages. A new labor-management conference, somewhat resembling the conference at which the pledge against strikes and lockouts was adopted, was proposed in August, and arrangements were completed by the Secretaries of Labor and Commerce in August and early September for the holding of such a conference in November. One of the main objectives of the conference was described as the working out of voluntary arrangements for the peaceful adjustment of industrial disputes to minimize the interruption of production in the reconversion period.

Activities of Conciliation Service of Department of Labor.—From Pearl Harbor to Aug. 1, 1945, the Conciliation Service of the Department of Labor handled 75,653 dispute situations. Of this number, 57,537 cases, or 76.1 per cent, were settled by purely voluntary processes of conciliation and arbitration. Most of the other cases, numbering 17,566, or 23.2 per cent of the total, were referred to the National War Labor Board for further action. In most of the cases certified to the board, a large number of the issues involved were settled through conciliation before certification. In addition to its conciliation functions, the Conciliation Service also handles arbitration and technical cases. In 3,757 cases the parties voluntarily agreed to the appointment of an arbitrator by the Conciliation Service. The Technical Division made 591 surveys on the joint request of the parties.

During the year ended June 30, 1945, the Conciliation Service closed 25,907 situations, affecting about 14,500,000 workers. The varied and often informal nature of the services rendered is indicated by the types of "situations" or cases handled: strikes and lockouts, controversies threatening work stoppages, other controversies, and cases not directly involving controversies.

The number of cases involving strikes and lockouts handled during the 12 months was 3,207, involving almost 2,000,000 workers. The number of these cases handled successfully by the Conciliation Service was 2,827, and the number certified to the National War Labor Board was 380. In 219 of these cases, a commissioner of conciliation effected a return-to-work agreement prior to certification to the board. Records disclose that 2,183 situations were threatened work stoppages and 17,731 were controversies in which requests were made for the assignment of conciliators to assist in the adjustment of disputes. The remaining 2,786 cases included 1,151 arbitrations in cases referred voluntarily to the Conciliation Service, 166 technical services, 322 investigations, and 1,147 requests for information, consultations, and special services. About 80 per cent of all industrial disputes during the year were settled through conciliation. The commissioners prevented work stoppages in 95 per cent of the cases which they entered before a stoppage had occurred.

The end of the war gave renewed importance to voluntary procedures in labor relations. The

change was reflected in modifications of the work of the National War Labor Board. In a statement made Aug. 16, 1945, in regard to labor policy, the president declared that in the strengthening of the Department of Labor and the unification under it of labor functions, emphasis would be placed on the upbuilding of the Conciliation Service. An important step in that direction was the transfer, on September 19, of the National War Labor Board to the Department of Labor.

Changes in Labor Administration.—The work of the Department of Labor was reduced, under the Reorganization Act of 1939, by the transfer of the United States Employment Service to the Federal Security Agency. The Employment Service was transferred in April 1942 to the newly created War Manpower Commission, to which was also transferred the section in the Department of Labor dealing with apprenticeship. During the war, a number of agencies, in addition to the War Manpower Commission, were created and given extensive labor functions. The most important of these from the point of view of labor administration was the National War Labor Board, but other agencies, such as the War Production Board and the Office of Price Administration, exercised certain labor functions. Some of the older agencies, especially the War and Navy departments, developed administrative activities in the field of labor, particularly in connection with the expansion of public contracts. (See *Labor Agencies and Functions of the United States Government*, AMERICANA ANNUAL, 1945.)

Numerous proposals were made for the strengthening of the Department of Labor. Thus, the Eleventh National Conference on Labor Legislation, in December 1944, adopted resolutions urging that all labor functions be established in the state and federal labor departments. The Secretary of Labor made recommendations in successive annual reports, and in October 1944, presented a detailed plan to the Bureau of the Budget. The president, on Aug. 16, 1945, stated that the plans of the new secretary of the Department of Labor were going forward for the strengthening of the department and for the unification under it of functions properly belonging to it. Recommendations had been made by the president, in his message to Congress of May 24 (repeated in his message of September 6), for authority to reorganize executive agencies to meet reconversion and postwar needs. Pending action by Congress, an initial step was taken by the president, in an executive order of September 19, for the transfer to the Department of Labor of certain agencies established during the war. These were the War Manpower Commission (including the Employment Service), the National War Labor Board, and the Retraining and Re-employment Administration.

LALIQUE, René, French jeweler and glassmaker: b. Ay, Marne, France, April 6, 1860; d. Paris, France, May 9, 1945. The influence of René Lalique on French art, jewelry and glassware was paramount for many years. Educated in Paris, Lalique showed such skill in design that he was apprenticed to a jewelry firm. After working for several of the leading Paris jewelers, he became a free-lance designer at the age of 30. His work created a sensation at the Paris Universal Exposition in 1900, where he exhibited jewelry designs which introduced the idea that emphasis should be placed not only on the jewel itself, but also on the appropriate arrangement of the whole setting, with such materials as translucent enamels, ivory, and horn being used. Later he experimented with glass design and introduced a variety of colors and shapes in his products, which ranged widely in subject, from radiator caps to crucifixes. At the invitation of the French government, an exhibition of his work was given in the Pavillon de Marsan of the Louvre in 1933, and his glass decorations were used in the dining hall of the transatlantic liner, *Normandie*. Lalique was a commander of the Legion of Honor, and a member of the Superior Council of Beaux-Arts.

LAMBS. The Department of Agriculture estimated the 1945 lamb crop of the United States at 28,250,000 head. This figure compares with the 1944 crop of 29,248,000 head and the 1934-43 ten-year average crop of 30,589,000 head. Texas leads in production with 5,284,000 lambs in 1945, followed by Montana with 1,924,000, and Wyoming with 1,918,000.

LANDS, Public. See PUBLIC LANDS.

LANG, Cosmo Gordon (1ST BARON LANG OF LAMBETH), British ecclesiastic: b. Aberdeenshire, Scotland, Oct. 31, 1864; d. Richmond, Surrey, England, Dec. 5, 1945. Archbishop of York from 1908 to 1928, and then archbishop of Canterbury from 1928 to 1942, Lord Lang, together with the former British prime minister, Stanley Baldwin, was the leader of the forces that brought about the abdication in 1936 of King Edward VIII, now duke of Windsor, because of his wish to marry the American divorcee, Mrs. Wallis Warfield Simpson.

Lord Lang received his M.A. degree at the age of 18 from Glasgow University, after which he won a scholarship and went to Balliol College, Oxford. He was elected a fellow of All Souls College in 1889. Intending to enter a political career, he studied law at the Inner Temple, London, until 1889, when, according to one story, he was converted to the church the night before his bar examinations, telegraphed his excuses to his law examiners, and almost immediately departed for a theological seminary. Ordained a minister of the Church of England in 1890, he served for three years as curate of the parish church of Leeds, then in 1893 returned to Oxford to become a fellow and dean of divinity at Magdalen College. The next year he was appointed vicar of St. Mary's Church at Oxford, also known as University Church. He left Oxford in 1896 to become vicar of Portsea, the largest parish in

LABOR LAW. See LAW, Section 6.

England, where his preaching attracted the attention of Queen Victoria, who appointed him one of her honorary chaplains. In 1901 he became suffragan bishop of Stepney, London's East End diocese, and canon of St. Paul's Cathedral in London. Eight years later, after he had been made archbishop of York, he was appointed privy councillor and a member of the Royal Commission on Divorce. In the spring of 1918, he visited the United States and Canada for the first and only time.

Lord Lang succeeded Randall Thomas Davidson as archbishop of Canterbury and primate of all England in 1928, and took a leading part in support of the Prayer Book measure in Parliament. Five years later he was made lord high almoner to the king. Shortly after the abdication of King Edward, Lord Lang rebuked him publicly "for having sought his happiness in a manner inconsistent with the Christian principles of marriage and within a circle whose standards and ways of life are alien to all the best instincts and traditions of his people." It was also he who refused to allow any form of Church of England service at the duke's wedding. The high point of Lord Lang's career came when he presided at the coronation of King George VI and Queen Elizabeth at Westminster Abbey in May 1937. One of his last official duties was to confirm Princess Elizabeth in March 1942. That same month he retired as archbishop of Canterbury and shortly thereafter he received a barony.

LAOS. See **FRENCH INDO-CHINA**.

LARSON, Emery Ellsworth, United States Marine Corps officer: b. Monticello, Minn., 1899?; d. Atlanta, Ga., Nov. 7, 1945. Head football coach at the United States Naval Academy from 1938 until 1941, Colonel "Swede" Larson coached Navy teams that in three years defeated West Point 10-0, 14-0, and 14-6, and their record for the three seasons showed 16 victories against 8 losses and 3 ties.

Colonel Larson enlisted in the Marine Corps in 1917 and was discharged in June 1918 to become a midshipman. During the three years he played football at Annapolis, the Navy team never lost a game to Army. He was captain of the team in 1921, when he was chosen center on Walter Camp's second All-America team. Upon graduation in 1922, he received the Thompson Trophy as Navy's outstanding athlete. Commissioned second lieutenant in the marines, he played with the All-Marine team at Quantico, Va., for three years, and then coached and played with the Parris Island (S.C.) marines. In 1927 he coached the All-Navy team in Hawaii, and the following season, during his spare time, he was line coach at the University of Hawaii. After two years in Nicaragua, he returned to Parris Island as football coach in 1931. He led the U.S.S. *Pennsylvania* team to the fleet championships in 1935 and 1936, and coached the 6th Marines in Shanghai in 1937. During the Second World War, he was sent to the Aleutians to help meet the Japanese invasion threat, and then led his regiment into the South Pacific for action at Tarawa, Kwajalein, and in the Marshall Islands. In February 1944 he was ordered to Marine Corps headquarters in Washington, D.C.

LASKI, Harold Joseph. British political economist, historian, and author: b. Manchester, June 30, 1893. From Manchester Grammar School he went to New College, Oxford University, where

he took a first class in the Honour School of Modern History in 1914. Already attracted to the labour movement, he wrote editorials for the London *Daily Herald*, and, not accepted for military service in the First World War, he went to Canada in the fall of 1914 to become lecturer in history at McGill University. In 1916 he transferred to a like post at Harvard, and during the four years he was there he was also Henry Ward Beecher lecturer at Amherst College, 1917, and Harvard lecturer at Yale University, 1919-20. Returning to Britain in 1920, he joined the faculty of the School of Economics and Political Science, London University; was appointed professor of political science in 1926, and meanwhile, as an active figure in the Fabian Society, he had become one of Britain's leading interpreters of socialism. During 1922-25 he lectured on political science at Magdalene College, Cambridge University; he returned to Yale as visiting professor in 1931, and as Storrs Lecturer two years later; he went to Moscow in 1934 to lecture at the Institute of Soviet Law; and he was Donnellun Lecturer at Trinity College, Dublin, in 1936. In 1926 he was named a member of the Industrial Court, and subsequently he served on several other official and semi-official bodies. He had joined the Labour Party in 1920, and soon he became identified with its left wing. Believing that capitalism was doomed, he asserted that the peaceful acceptance of socialism was the only alternative to revolution. During the Second World War he was given no post in the coalition administration formed by Prime Minister Winston Churchill, but nevertheless he exerted great influence in the formulation of the Labour Party's policy and development of its legislative program. In January 1944 he was elected vice chairman of the party's national executive committee, and in May of the following year he succeeded Ellen Wilkinson as chairman. He sought no parliamentary seat in the general election of July 1945, but after the Labour Party had been returned to office he continued to be one of its most powerful figures. From 1920 he was a regular contributor to *The Nation*, a liberal weekly published in London, and he wrote a large number of works, which include: *The Problem of Sovereignty* (1917); *Authority in the Modern State* (1919); *Communism* (1927); *Democracy in Crisis* (1933); *Parliamentary Government in England* (1938); *The American Presidency* (1940); *The Danger of Being a Gentleman* (1940); *Where Do We Go From Here?* (1940); *The Strategy of Freedom* (1941); *Marx and Today* (1943); *London-Washington-Moscow: Partners in Peace?* (1943); *Faith, Reason, and Civilization* (1944); *Will Planning Restrict Freedom?* (1944).

LATIN AMERICAN AFFAIRS. See **INTER-AMERICAN AFFAIRS**; **PAN AMERICAN AFFAIRS**; **WORLD POLITICS**.

LATIN AMERICAN ART. The years 1944-45 were marked by an intensification of art activities in the Latin American countries, manifested by the creation of more than twelve new art salons and societies. An expanding program of exchange exhibitions between the various countries gave greatly enlarged audiences to national groups. A revival of interest in the 19th century masters was felt in retrospective shows held in several of the major art centers.

In 1944 Mexico showed a large exhibition of the work of Toulouse Lautrec, the French impressionist painter, at the Palace of Fine Arts. The collection had been sent to Mexico by the

Art Institute of Chicago in exchange for a group of prints by the 19th century Mexican engraver, José Guadalupe Posada. The Posada collection, after opening at the Art Institute, circulated among North American museums, as did an exhibition of the 19th century Mexican landscape painter, José María Velasco, brought to this country by the Philadelphia and Brooklyn museums.

The Palace of Fine Arts continued its interest in the 19th century by showing in 1945 an exhibition of the work of Joaquín Clausell, whose impressionist technique formed a marked contrast to the finely detailed work of his contemporary, Velasco.

José Clemente Orozco, his murals in the Hospital de Jesús completed, held exhibitions of his new work in 1944 and 1945 in the Colegio Nacional. Dr. Atl (Gerardo Murillo) held a retrospective one-man show in 1944 which re-established his importance in the history of modern Mexican art.

The Society of Modern Art, founded in 1944, opened its doors with a loan exhibition of the work of Pablo Picasso, assembled with the help of the Museum of Modern Art in New York. The gallery followed the showing in 1945 with an exhibition of Mexican masks, directed by Miguel Covarrubias; and with a showing of photographs by Manuel Álvarez Bravo, the sensitive interpreter of Mexico's inner spirit.

David Alfaro Siqueiros returned to Mexico from Cuba in 1944 and opened his Center of Realistic Modern Art, a workshop and school in which he painted a mural which combined the use of sculpture by Luis Arenal and of a circular stairway which formed an integral part of the composition. The artist painted a second mural in the Palace of Fine Arts in 1945, on the long wall situated between the murals of Diego Rivera and Orozco, thus reuniting in the Palace the three great spirits of the Mexican revolution in art.

Two important books on art were published in Mexico in 1945: the first, *No hay mas ruta que la nuestra*, by Siqueiros, brings together many of his articles and manifestoes which were published separately in 1944 and 1945 in various Mexican magazines. The new book, *Prometeo*, by Justino Fernández presents a survey of modern art movements with an attempt to evaluate the importance of the Mexican movement in relation to international contemporary art.

In Argentina the National Museum of Fine Arts celebrated its 50th anniversary in July 1945. The museum had been closed for some time in order to modernize and rearrange its collection of more than 4,000 works of art. The National Art Library was transferred to the museum building, bringing with it some 12,000 volumes. In November of 1944 the museum presented a large retrospective exhibition of the work of Cesáreo Bernaldo de Quirós, Argentina's painter of the 19th century gaucho.

The Association of Argentine Artists celebrated its 17th anniversary in 1945. The National Salon in Buenos Aires awarded in 1944 its Grand Painting Prize to Alfredo Guido; its Grand Sculpture Prize to Horacio Juárez. Juan C. Castagnino won the First Drawing Prize in the Salon of Watercolorists and Graphic Artists, as well as the Second National Prize in the National Salon of 1944.

Of international interest was the exhibition of Gothic and Renaissance art in 1944. Gathered together for the benefit of the Association for the Fight Against Infantile Paralysis, the collection

was unusual not only for its excellent quality, but also because all of the 180 pieces came from collections in Buenos Aires, some exhibited publicly for the first time. The Museum of Santa Fé presented a handsome exhibition of "100 Years of Painting in Santa Fé," followed in 1945 by an exhibition of the gaucho paintings of Bernaldo de Quirós.

The more than 250 exhibitions listed in Buenos Aires for the year 1944 included personal exhibitions by many of Argentina's leading artists, as well as works of art from Mexico, Uruguay, Brazil, Cuba, and the United States. Argentina's publishing houses continued their presentation of the best of the contemporary artists in monograph form. José León Pagano published in 1944 his *Historia del arte argentino* and Julio Payró presented 22 *Pintores*, with unusually fine color plates of the work of Argentina's modern artists.

Bolivia came forward with an intensification of her artistic life which included the creation of a Municipal Council of Culture in La Paz; the reorganization of the Department of Culture of the Ministry of Education and Fine Arts; the establishment of the First National Salon of Fine Arts and the organization of the Union of Plastic Artists. Four of her artists were given foreign scholarships for study in the United States, and nine artists held one-man shows in 1944.

Chile held the First Salon of the Association of Painters and Sculptors in 1944; and in 1945 inaugurated the Institute of Plastic Arts of the University of Chile, founded for the encouragement of Chilean artistic endeavor. Activities in 1944 included the Week of Art, in which Pablo Burchard was awarded the National Art Prize. An exhibition, "Homage to France," showed paintings done in that country by Chilean artists. Santiago had probably the greatest number of individual exhibitions in her history, more than forty being listed. Chilean artists exhibited their work in traveling shows in Uruguay and Brazil.

Uruguay inaugurated its First Municipal Salon for Foreign Artists with more than 150 works; the First Salon of National Graphic Artists was organized by a group founded under the title of Association of Uruguayan Graphic Artists; and 1945 saw the founding of the Syndicate of Plastic Artists of Uruguay, with Bernabé Michelena, the sculptor, as its president. An exhibition so large it had to be held in three parts showed the work of Pedro Figari, Uruguay's master of 19th century creole life. Joaquín Torres García won the Grand Painting Prize in the National Salon of 1944 and in the same year published his profusely illustrated magnum opus, *Universalismo constructivo*, in which he set forth the art philosophy which has been the storm center of Montevideo for the past few years.

Venezuela's prizes in the Official Salon of 1944 went to Pedro León Castro in painting and Germán Cabrera in sculpture. The Dominican Republic celebrated its first centenary with a National Exhibition of Plastic Arts in 1944, and in 1945 three of the younger Dominican artists held an exhibition of their work in Mexico City. Ecuador founded its First National Salon in Quito in May of 1945, awarding the Grand Painting Prize to Diógenes Paredes, the Grand Sculpture Prize to Jaime Andrade. The work of the Ecuadorian artists was shown in Venezuela. Haiti stepped into the international field with the foundation in 1944 of a Centre d'Art, organized by the young American artist, DeWitt Peters. The centre has undertaken an active program of exhibitions, classes, lectures and publications.

The Cubans held group exhibitions in Haiti, Argentina and Guatemala. The Museum of Modern Art in New York held a large exhibition of the younger artists in 1944, which was subsequently circulated throughout the United States. The national salons awarded prizes to Jorge Arche, Maria Capdevila, Rita Longa and Teodoro Ramos Blanco. A group of Cuba's more rebellious artists visited the United States and held one-man shows in New York and San Francisco, in protest against the over-academic tendencies of official Cuban art.

Brazilian painting was shown in Argentina at the Museum of La Plata. A second exhibition circulated in Chile and Peru. One hundred and twenty Brazilian paintings, after a showing in Rio in 1943, went to London where they were exhibited at the Royal Academy, for the benefit of the Royal Air Force. A group of ten of the pictures was withheld to form the nucleus of a future museum of Brazilian art in London. Count August Zamoyski, Polish sculptor for many years resident in Paris, became in 1944 the director of the University of Rio's Free Course in Sculpture, a workshop and co-operative atelier which earned more than \$1,000 in the first year of its existence. José Maria Dos Preis, Jr., published in 1944 his definitive *Historia da pintura no Brazil* with 312 illustrations, and Sergio Milliet presented *Pintura quase sempre*, an attempt at international art criticism.

Peru held a large exhibition of the work of Pancho Fierro, the delightful interpreter of 19th century Peruvian life. Cossio del Pomar, Peruvian artist and author, published in Mexico in 1945 his *La rebelion de los pintores*, which seeks to prove that social causes lie beneath all great artistic revolutions.

The publication within the last few years of books which treat Latin American art as an integral part of the international movement, the programs of exchange exhibitions between the various countries, and the emergence of new syndicates and unions of artists in rebellion against the *indigenista* or reactionary academies, seem to indicate a healthy tendency for Latin America today to take her place in the world of art, transcending a purely nationalist point of view in favor of a universal art language.

LESLIE JUDD SWITZER,
Art Specialist, Division of Intellectual Cooperation, Pan American Union, Washington, D.C.

LATIN AMERICAN LITERATURE. Perhaps the most appreciable literary contribution of 1945 belongs in the nonfiction category. From the astounding number of biographies and essays a few may be singled out for their intrinsic merit: the *Anatole France* of Luis Reissig, the *Introducción al teatro de Sófocles* of María Rosa Lida, the *Éça de Queiroz* of Vianna Moog, all published in Buenos Aires. The Argentines paid considerable attention to their national figures: there were a warm, well-balanced and inspired biography of *San Martín* by B. González Arrioli and a *Cronología de San Martín* by C. Galván Moreno; Carlos Alberto Leumann achieved a superb analysis of the second part of *Martín Fierro* by studying exhaustively six MS. notebooks left by its creator, José Hernández, and Martín Manso completed a very useful dictionary, *Las voces de Martín Fierro*. In celebration of the centenary of *Facundo* (1845) Sarmiento attracted many scholars and politically-minded writers: Alberto Palcos' *El Facundo* elucidated brilliantly the style and contents of that epoch-

making book and dealt with the corrections and modifications suggested by Valentín Alsina; Manuel Gálvez' *Vida de Sarmiento* was a Nazified attack upon Sarmiento's democratic activities: Gálvez claimed that Sarmiento was a second-rate writer, a wretched educator, an inept president. On the occasion of the 100th anniversary of the death of Bernardino Rivadavia (1780-1845), the poet Arturo Capdevila edited, with an introduction, passages from the writings of this great humanist and leader. Capdevila published also *Tiempos y poetas*, dealing with the publicist and educator Alfredo L. Palacios, and five poets: Carlos Guido Spano, Olegario V. Andrade, Rafael Obligado, Joaquín Castellanos and "Almafuerte" as well as the travelogue *Tierra mia*, describing in a most evocative manner the paths and bypaths of his native province of Buenos Aires. Félix Esteban Cichero studied several leading poets, including Hernández and Alfredo R. Bufano in his *Vida esencias*. Bold and especially timely for his own country was Arturo Orgaz' attack on dictatorships, *El espíritu autoritario*, published by the University of Córdoba. The well-documented *Los Capataces alemanes en la Argentina* by Luis V. Sommi, presented a disturbing picture of Nazi penetration in Argentina. Diodoro Roca's *Las obras y los días*, which contains magnificent passages from the writings of this distinguished writer, was unanimously acclaimed as one of the highlights of 1945. Finally, in *El compadrito*, Sylvia Bullrich Palenque and Jorge Luis Borges culled selections in prose and verse from Argentine literature describing a national type, as picturesque as the gaucho—the boastful, bad hombre of the small towns.

From Colombia Jorge Ricardo Vejarano presented a full-length portrait of Nariño in his biography by that title. The Bolivian Augusto Guzmán recounted in an exciting novel form, *Tupaj Katari*, the 18th century Indian uprising and siege of La Paz under the leadership of José Julián Apasa, "Tupaj Katari." Alfonso Crespo dealt with Santa Cruz in *Santa Cruz, el cóndor indio* and Leopoldo Benítez dramatized in his extremely readable *Argonautas de la selva* the jungle adventures of Francisco Orellana, the founder of Guayaquil. The works of Guzmán, Crespo and Benítez form part of the promising series "Tierra Firme" (Mexico City) which comprises also a synthetic study of Colombian literature, *Letras colombianas*, by the veteran B. Sanín Cano; a specialized history of 19th century Mexican literature, *Letras mexicanas en el siglo XIX*, by J. Jiménez Rueda; a panorama of Spanish American culture during the colonial period, *De la Conquista a la Independencia*, by the Venezuelan Mariano Picón-Salas; Arthur Ramos' *Las poblaciones del Brasil*, a keen summarization of Brazilian ethnography; the remarkable *Ruta cultural del Perú* by Luis E. Valcárcel; *Del ensayo americano*, a rather diffuse study of the essay and its content by the Cuban Medardo Vitier; and, finally, Gilberto Freyre's *Interpretación del Brasil*, the Spanish version of *Brazil: An Interpretation*, recently published in New York. The Colegio de Mexico came out with *Apogeo y decadencia del positivismo en México* in which the brilliant Leopoldo Zea rounds out his pithy study of Mexican Positivism. Brazilian contributions included a biographical sketch of Nina Rodrigues, pioneer of Afro-Brazilian studies, *A atualidade de Nina Rodrigues*, by Augusto Lins e Silva; two interesting monographs by Nelson Werneck Sodré: *Formação da sociedade*

brasileira, and *O que se debe ler para conhecer o Brasil*. Phocion Serpa's exhaustive biography of Dr. Oswaldo Cruz has been translated into Spanish as *Oswaldo Cruz el Pasteur de Brasil, vencedor de la fiebre amarilla*.

In the field of poetry the most exciting news of the year was the awarding of Chile's Premio Nacional to Pablo Neruda who, despite his difficult utterance and revolutionary content, has gradually been recognized as one of Latin America's greatest poets. The most important poem of the year was probably *Requiem*, by the Chilean Humberto Diaz Casanueva, an elegy at his mother's death, whose deeply felt sentiment voiced in sober and pristine language is to us what *Adonais* was to Shelley's contemporaries. Other outstanding achievements were: the beautiful sonnets of the veteran Pedro Prado, *Esta bella ciudad envenenada*; the fantasies of Jacobo Danke *La taberna del perro que llora*, so evocative of Lord Dunsany's misty world; and the very simple human, sweet poems of Rafael Coronel, *Con los Párpados cerrados*. Brazil discovered an original, realistic poet in Cid Silveira's *Poesias*, and Lucio Cardoso's *Novas Poesias* received warm praise. Among the anthologies: *Ternura*, containing all that Gabriela Mistral has written about children, and an *Antología* of the poetical works of Vicente Huidobro, edited by Eduardo Anguita. With the awarding of the Nobel Prize for Literature to Mistral, Latin American Literature is at long last officially recognized by the world.

Fiction as a whole fared badly: among the work of recognized writers Eduardo Barrios' *Tamarugal* was disappointing; *Donde nace el alba* did not add a cubit to Nicomedes Guzmán; and Francisco Rojas González' *La negra Angustias*, despite some moving and extraordinary episodes, was weak as a novel. Deserving special attention were Isidoro Sagüés' *Mal de ciudad*, dealing with urban life; Leonidas Barletta's melancholy stories of the underprivileged, *La felicidad gris*; some of the short stories in *Dios en la tierra* and *La sombra de las cumbres*, the former by the Mexican José Revueltas, the latter by the Chilean Oscar Castro. Promise was shown by María de Clarés in her first novel *Cuando el agua es clara* and by Nicasio Tangol in a novel dealing with his native Chiloé, *Huipampa, tierra de sonámbulos*. Also dealing with strange regions and characters and containing some distinguished writing were Dinka de Villaroel's *Norte adentro*, and Rafael Fernández Rodríguez' *Tierras de Pedro Ramirez*, reflecting the life of miners, fishermen, witches and peasants of Colchagua. The noisiest literary "sensation" of 1945 was *Avenida San Juan No. 124* by Gregorio Amunátegui, well-known politician and member of the Chilean Senate. His mediocre *roman à clef* brought to the forefront the more prominent members of the social elite of Santiago.

Outstanding United States writers appeared in Spanish translation (T. S. Eliot's *The Wasteland*, etc.) in the remarkable two-volume *Antología de Escritores Contemporáneos de los Estados Unidos*; also worth noticing are Argentine translations of Melville's *Moby Dick* (*La ballena blanca*) and Erskine Caldwell's *Jackpot*.

Latin American contributions recently made available in English include three "classics": the romantic novel *Inocencia* by the Brazilian Alfredo d'Escagnolle Taunay; stories by the Peruvian Ricardo Palma, *The Knights of the Cape*; and a biography of San Martín by the Argentine Ricardo Rojas; two contemporary novels: the

remarkable *Violent Land* of the Brazilian Jorge Amado and the unconvincing *Bewitched Lands* of the Bolivian Adolfo Costa du Rels; an anthology, *The Green Continent*, edited by the Colombian Germán Arciniegas, calculated to present Latin America as seen through the eyes of Latin American writers; two illuminating literary histories: Erico Verissimo's *Brazilian Literature* and Pedro Henríquez Ureña's *Literary Currents in Hispanic America*; and, finally, a brief but extremely searching *Brazil: An Interpretation* by the social anthropologist Gilberto Freyre.

Among the losses of the year perhaps the most regrettable was that of the poet, novelist and music critic Mario de Andrade, whose death on Feb. 25, 1945, at the age of 52, deprived Brazil of one of its most dynamic cultural figures.

ANGEL FLORES,
Queens College, New York.

LATIN AMERICAN MUSIC. Information upon concert music activity in Latin America is still relatively spotty. Except through sound-recordings of Zoque, Tzotzil, Chiapaneco and Tojolobal Indians made under the auspices of the Inter-American Indian Institute in Mexico City by Henrietta Yurchenco, little, apparently, was added during the year to our knowledge of the primitive music of those areas of the new world where romance languages are the official tongue.

Collection, study, utilization and organization have made notable progress in the field of folk music (which may be European in tradition, or European mixed with indigenous and/or African traditions). Nearly every country has recognized in this idiom certain elements suitable for use as nationalistic propaganda. Composers, critics, educators and even performers have either joined the band-wagon of "folclorismo," or started it rolling, although in most countries there is little basis for it in fact. Apart from Brazil, where the Portuguese language accounts for a music regionalism more or less coinciding with the national boundaries, and Mexico, where over 30 years of deliberate cultivation by the revolution have highlighted and, perhaps, influenced the mixture of native Indian and imported European music traditions in a manner peculiar to the country, Latin American folk music is almost as international as the Spanish language. Songs and dances characteristic of distinct localities, and of geographically defined regions such as the Andean highlands or Pacific coastal strip, show variations in the overall patterns that are often claimed as "national." But these spread beyond national boundaries, as a rule. Thus two music variants of a theme from two countries may differ less than two found within one and the same country or even city.

In the field of fine-art music (variously referred to as academic, erudite, serious or simply "art" music), activity has continued to increase, both in quantity and in quality. The controversy between nationalism and cosmopolitanism is still a draw in which the question "folklorism or anti-folklorism?" is the crucial factor. An emerging problem is found in the relative roles of government, individual creative power and collective organization. Governments control conservatories, orchestras and opera houses, and, through prizes and grants of funds, hold the whip hand in most countries. Where, as in Mexico, professional organization has assumed clear-cut leadership, in Brazil it is the dominating personality of Heitor Villa-Lobos—composer, conductor and music educator—which seems to do

so. Co-operation of the government has resulted in both countries. In Argentina, on the other hand, most of the brilliant musicians have held aloof from, or even been at odds with, the government. Juan José Castro, perhaps the outstanding musician of the country, was deprived of all his government positions—first conductor of the Colón Opera and professor in the national conservatory—because he signed in 1943 the famous manifesto "Effective Democracy and American Solidarity." In collaboration with the APO (Asociación del Profesorado Orquestal de Protección, Argentine counterpart of the Musicians' Union of the United States), he has been conducting a philharmonic orchestra, reportedly one of the best in the hemisphere.

Popular music has continued to be the most successful music activity in this part of the world. Hybridization of popular music of all four Americas—South, Central, North and Antilles—seems to be increasing rather than decreasing, in spite of the parades of the band wagon of nationalism. This results from, but in turn leads to, increased exchange of artistic talent through broadcasting, cinema, phonograph recording. Problems of copyright, performance right and concert management still hamper these international efforts. Owing to the intervening of several more basic international conferences, the proposed Inter-American Conference of Experts on the Protection of Intellectual Property was not held. FISAC (Inter-American Federation of Societies of Authors and Composers) held its first congress in Havana Jan. 16–20, 1945, attended by some of the societies which had threatened to form an opposition in Rio de Janeiro under the leadership of SADAIC (Argentine Society of Authors and Composers). United States ASCAP (American Society of Composers, Authors and Publishers) joined FISAC, whose constitution did not allow adherence of BMI (Broadcast Music, Incorporated) or UBC (Brazilian Union of Composers). SADAIC remained aloof. New societies have been formed during the year in Bolivia (SOBODAIKOM), Peru (SPAC) and Uruguay. Efforts are being made to unify the four Cuban societies. Several countries contain no fee-collection agency or one in name only.

The hemisphere difficulty is that Latin American societies are societies of authors, whereas United States societies (excepting ACA—American Composers' Alliance) include publishers or are company owned.

Inter-American exchange of artists continued upon about the same level in 1945 as during the preceding year, with about the same names. Carlos Chávez resigned from the Mexican Symphony Orchestra but remained as artistic director. Heitor Villa-Lobos spent about four months in Los Angeles and New York, conducting a number of orchestras. Other Latin American composers visiting the United States were Ary Barroso of Brazil, José Velasco Maidana of Bolivia and Ernesto Lecuona of Cuba. Camargo Guarnieri visited Argentina and Chile—Hector Tosar Errecart of Uruguay spent some time in Brazil. On the whole, exchange of visits of musicians was unusually active in the southernmost countries of South America, including Brazil, Chile and Peru. Columbia Concerts, Inc., has embarked upon promotion of its community concerts project upon an inter-American scale, employing Latin American as well as United States artists. The field representative is Myron Schaeffer, formerly of the University of Panama.

Since V-E and V-J Days, publication prospects

have brightened. Outstanding new works of the year were Carlos Vega's *Panorama de la música popular argentina* (Losada); Gilbert Chase's *A Guide to Latin American Music* (Library of Congress, Washington, D.C.); Nicolas Slonimsky's *Music of Latin America* (Crowell); José Ignacio Perdomo Escobar's *Historia de la música en Colombia* (Biblioteca Popular de Cultura Colombiana); Vanett Lawler's *Music Education in 14 American Republics* (Pan American Union). Francisco Curt Lange has continued, in Rio de Janeiro, publication of Volume VI of the *Boletín Latino-Americano de Música*. He has unearthed a lot of new material on Louis Moreau Gottschalk and a large quantity of colonial music in the state of Minas Gerais, Brazil. Alejo Carpentier has done the same in Santiago de Cuba.

New music magazines appeared as follows: *Brasil Musical* (Rio de Janeiro, March); *Revista Musical Chilena* (Santiago, May), *Vida Musical* also of Chile (Santiago, July).

Interest in the Reichhold Music Award of \$25,000 has overshadowed the numerous prizes customarily offered for musical compositions. Owing to protests received by Karl Krueger, United States conductor, during his tour of South America, the rules were drastically altered and the date advanced from July 1945 to March 1946. Announcement was made by the Pan American Union that entries for the international phase of the American Student Song Contest for 1945 would be received as of September 30 until December 31.

Necrology.—Mario de Andrade (b. 1893), Brazilian philosopher, poet, folklorist and musicologist; Francisco Braga (b. 1868), the grand old man of Brazilian music; José Rolón, Mexican composer (b. 1883); Moises Simons, Cuban composer of light opera (b. 1890).

CHARLES SEEGER,

Chief, Music Division, Pan American Union.

LATTER DAY SAINTS. See MORMONS; REORGANIZED CHURCH OF JESUS CHRIST.

LATVIA. A state on the eastern side of the Baltic Sea, extending south and east of the Gulf of Riga, bounded on the north by Estonia, on the south by Lithuania, and on the east by the Russian and White Russian Soviet Republics. Latvia, which had been under an authoritarian regime since 1934, and increasingly subject to German influence, signed in October 1939 a ten-year mutual assistance pact with the Soviet Union, the provisions of which included Soviet military occupation of certain strategic points. In May 1940, following a sharp Soviet warning, the authoritarian and anti-Soviet government of Latvia was ousted by a democratic-left opposition, and Soviet forces occupied the country. A revived Latvian *Saeima* (parliament), reportedly based on universal, direct, secret balloting, asked for Latvia's admission to the USSR, and on Aug. 5, 1940, Latvia became the Soviet Union's 15th constituent republic. In the summer of 1945, however, its status as such was still not recognized by the United States or Great Britain. Occupied by the Germans in June 1941, most of the territory of Latvia was freed from the German occupation by the Red armies in July and August 1944.

Latvia has an area of 25,395 square miles and in 1940 had a population of 1,950,000. In 1935, 77 per cent of the citizens of Latvia were Letts and 11.91 per cent were Russians. Riga (pop. 393,211) is the capital, other important

centers being Liepāja, (Lepaya, Libau, 57,098), Daugavpils (Dünaburg, Dvinsk, 45,160), Jelgava (Mitau, Mitava, 34,099), and Ventspils (Windau, 15,671). Prior to the German invasion there were 1,895 elementary schools with 229,825 pupils, 114 secondary schools with 25,225 pupils, a university, with 7,281 students, and a number of technical and professional schools. The budget for 1941 was estimated at 894,000,000 rubles. Principal crops, in metric tons, for 1938, were: rye, 378,690; barley, 220,570; oats, 446,620; wheat, 191,920; potatoes, 1,751,360; flax, 21,460; and linseed, 20,390. In December 1938 there were 5,977 factories, with 98,497 operatives. Total production was valued at 699,100,000 lats (lat = \$.1930 in U.S. currency. Live-stock in 1939 included 414,470 horses, 1,271,730 cattle, 1,469,570 sheep, 891,470 pigs, 4,729,120 head of poultry, and 222,460 hives of bees. Trade in 1938 showed imports valued at 227,336,000 lats, and exports of 227,204,000 lats. Timber, flax, plywood, and butter were the chief exports.

At the third session of the Supreme Soviet of the Latvian SSR, reported in October, 1944, as having been held at Daugavpils, primary consideration was given to the restoration of Latvian agriculture, to which the Germans had done great damage, confiscating land, cattle, and crops, carrying off 60 per cent of the sheep, destroying a fourth of the farm buildings, and forcing the Latvian peasants to work for landowners approved by the Nazis. The session adopted a law restoring the confiscated land to the peasants, and granted each farmstead a loan of 10,000 rubles, repayable in seven years. Laws were also passed providing for the formation of commissariats of defense and of foreign affairs for Soviet Latvia.

By December 1944, 25,700 farm families were reported to have received allotments of land; the city of Daugavpils, which like almost all Latvian towns, had been destroyed, was being rapidly rebuilt, and some of its factories reopened for production, and classes resumed at the State Agricultural Academy. During the first quarter of 1945 postal services were fully restored, with 535 post offices in operation, and newspapers and periodicals were appearing in the Latvian language. Dormitories and dining rooms had been set up in connection with 42 schools to care for children from distant villages. In April an extraordinary state committee reported that the Germans, in the course of their attempt to establish control over Latvia, in addition to wrecking the country's agricultural, industrial, and cultural institutions, had exterminated 250,000 civilians and 327,000 war prisoners, and had driven 175,000 Latvians into slavery. The liberation of Latvia from the Nazis was completed in May 1945 with the surrender of two German armies which until that time had continued to hold the Kurland district.

LAVAL, Pierre, French politician: b. Châtelon, Puy-de-Dôme, France, June 28, 1883; d. Oct. 15, 1945. Member of the Vichy triumvirate which ruled France under German domination, Pierre Laval, who had three times been premier of France, was condemned to death on Oct. 9, 1945, after trial by the French High Court of Justice, which convicted him on a double count of plotting against the state and having intelligence with the enemy. He died before a firing squad on the morning of October 15, shortly after having made an unsuccessful attempt at suicide by poisoning.

Long a prominent figure in national and international politics, Laval was named foreign minister and vice premier in the Pétain government after the collapse of France in 1940. He was relieved of these posts in December 1940, charged with plotting to gain additional power in the government, and was detained under guard until Otto Abetz, Nazi delegate, appeared in occupied France. Throughout 1941, Laval remained in the background, continuing, however, to scheme for closer collaboration with Germany. During this period, at least one attempt was made on his life. He was reinstated in the government in April 1942, with his appointment as premier, and was given full government control through Marshal Pétain. Thereafter, he followed a thoroughly pro-Nazi policy, keeping alive the anti-Soviet crusade and giving full support to the deportation of French labor to Germany. In November 1942, he was given dictatorial powers by Pétain. Laval fled to Germany in August 1944, just a few days before French and American troops occupied Paris. On May 2, 1945, he was flown in a German plane to Barcelona, where he was interned by the Spanish government. He was taken by air to Linz, Austria, on July 31, and surrendered to American troops. The following day, he reached Paris where he was imprisoned to await trial for treason. On August 3-4, he testified at the trial of Marshal Pétain, speaking in his defense. Laval entered French politics in 1914 as a Socialist member of the Chamber of Deputies; he became a senator in 1926. He was general secretary of the "présidence du conseil" and of the Ministry of Foreign Affairs (the equivalent of undersecretary of state) in the Briand Cabinet, November 1925-March 1926. He was minister of public works, April-October 1925; minister of justice, March-July 1926; minister of labor, March-December 1930; and foreign minister, October 1934-May 1935. He served his first term as prime minister from January 1931 to February 1932; his second, from June 1935 to January 1936. Laval's influence was strongly felt in both French and European politics. In the domestic field, he used the policy of deflation in an effort to relieve France's financial situation in 1935. In January of that year, he negotiated with Italy for a Franco-Italian agreement, and in February, took part in the London disarmament conference. In the Italo-Abyssinian conflict, he teamed with British Sir Samuel Hoare, and opposed sanctions against Italy. In 1931, he visited the United States for discussion of French war debts.

LAW. In 1945 the world laid down the sword but did not put its shoulder very effectively to the wheel of peace. It was a transition year. War was ending and peace was coming. Everyone's thoughts were intent on ending the war and beginning the peace. The problem of winning the war was solved, but the equations for solving the peace were still unstated.

Developments in law reflected this condition. There were few vital changes in fundamental peacetime law. The adoption of the federal code of criminal procedure was the principal event. In the field of human relations, however, there were many court decisions and legislative acts of significance. The rights, privileges—and to a lesser extent—the duties of labor, occupied much of the time of the courts and the legislators; and there was considerable indication that courts and people were beginning to be concerned over the question whether race

relations are a cancer or merely a removable tumor in the American body politic.

This year's developments in law will be classified under twelve heads.

(1) **Administrative Law.**—The war agencies were on the way out during 1945, but many administrative boards and commissions will survive; and there were some noteworthy decisions and rulings.

On June 15 the Supreme Court of the United States defined the relative jurisdiction of administrative agencies and courts with reference to the judicial review of administrative orders. A fraternal benefit association had transferred its radio station. While the application for approval was pending before the Federal Communications Commission (FCC), a member of the association filed suit in a state court to set aside the lease on the ground of fraud. The FCC went ahead and approved the transaction, and the association then claimed that the courts had no further jurisdiction in the matter. A state court canceled the lease, but made no ruling upon the accompanying license to operate the station. (*AMERICANA ANNUAL*, 1945, p. 415.) On certiorari the federal Supreme Court on June 18 reversed the state court's decision, notwithstanding the pendency of an accounting under the state court's decree, and directed the state court to withhold execution of the retransfer order pending FCC ruling upon the license. *Radio Station WOW, Inc. v. Johnson*, 89 L. ed. Adv. Op. 1397, 65 S. C. Rep. 1475, 13 L. W. 4568. In October, the Nebraska court interpreted the Supreme Court's decision as being merely advisory and refused to modify its own decree.

On June 11 the court set aside Interstate Commerce Commission (ICC) orders authorizing intrastate passenger rates higher than the limits set by a state commission. *No. Car. v. U.S.*, 89 L. ed. Adv. Op. 1287, 65 S. C. Rep. 1260, 13 L. W. 4522.

On June 4 it construed an Office of Price Administration (OPA) ceiling price in favor of the OPA. *Bowles v. Seminole etc. Co.*, 89 L. ed. Adv. Op. 1186, 65 S. C. Rep. 1215, 13 L. W. 4459.

On May 28 the court affirmed the jurisdiction of the ICC to revise rate structures and transfer privileges over buslines carrying government employees between Virginia and the District of Columbia during the war emergency. *U.S. v. Capital, etc. Co.*, 89 L. ed. Adv. Op. 1175, 65 S. C. Rep. 1176, 13 L. W. 4449.

On May 21 it approved the power of the FCC over hotel charges on long distance telephone calls. *Ambassador, Inc. v. U.S.*, 89 L. ed. Adv. Op. 1103, 65 S. C. Rep. 1151, 13 L. W. 4419.

As to the OPA, there were differences of opinion in 1945 as in previous years among the state courts as to the effect and enforceability in the state courts of OPA orders. The Supreme Court of Indiana ruled that OPA directives are legal under the war powers of the president. *State v. Alexander*, 59 N. E. 2d 169 (February 14). In several other states (e.g., Maryland, New York and Ohio) state and municipal jurisdiction of such suits was approved. The Rhode Island Supreme Court, however, ruled against the power of the state courts to enforce OPA penalties, and in Idaho and Washington, state courts insisted upon exercising independent judgment against OPA orders where the particular orders were held not to be vital to the success of the program.

The municipal court of Boston refused to take jurisdiction of a consumer's suit because by the terms of the federal statute the court had no power to consider the validity of the regulation itself.

As to the Security and Exchange Commission (SEC),—the New York Supreme Court ruled that New York state courts have no jurisdiction over suits by corporations against officers to recover under the SEC Act profits derived by them from trading on the basis of inside knowledge. One section authorizes suit in any court; another section gives federal courts exclusive jurisdiction. The court failed to find any clearly indicated concurrent jurisdiction, and found practical reasons against it. *American Distilling Co. v. Brown*, 54 N.Y.S. 2d 855 (Dec. 12, 1944).

As to censorship,—the federal district court decision in the *Esquire* case (*AMERICANA ANNUAL*, 1945, p. 415) was reversed by the Circuit Court of Appeals (CCA), which ruled that the postmaster general may not revoke second class mailing privileges of a magazine which is admittedly not obscene on the ground that it is "morally improper and not for the public welfare and the public good." The court said that no administrative official can properly have the power first to determine what is good for the public to read, and then to force compliance with his ideas. Mail service is not a special privilege. The court told the post office officials to stick to their knitting and confine themselves to the prosaic function of seeing that the mail gets delivered. *Esquire v. Walker*, 13 L. W. 2678, reversing 13 L. W. 2048 (CCA D.C., June 4). The decision was appealed to the Supreme Court.

In another decision against censorship, the CCA of the District of Columbia ruled that an educational sex pamphlet may not be barred as obscene, even though it may be misused and misconstrued, provided the language is "uniformly decent." "The dominant effect of an entire publication determines its character." *Walker v. Popenoe*, 13 L. W. 2660, (CCA D.C., May 28).

In this connection the decision of the Supreme Judicial Court of Massachusetts in a censorship matter is pertinent. That court in September upheld a conviction, following an administrative ruling, where a bookseller sold *Strange Fruit*. The court said:

"Regarding the book as a whole, it is our opinion that a jury of honest and reasonable men could find beyond a reasonable doubt that it contains much that even in this post-Victorian era would tend to promote lascivious thought and to arouse lustful desire in the minds of substantial numbers of the public into whose hands this book, obviously intended for sale, is likely to fall."

Significant administrative rulings were these:

ICC,—a transportation broker helping shippers but paid by motor carriers is not entitled to an ICC license,—the carrier receives no service for the money paid and the practice would give the broker control over favored lines. (July).

FCC,—although both the majority and the minority howled about the curse of bigness, the majority of the commission allowed on September 6 the transfer of one of the most important broadcasting facilities to a large industrial empire. The majority found no express power to object, and said it was up to Congress. The minority said it was a problem of righteousness with plenty of precedent for refusing the permission. The commission, however, said it would

mend its rules to prevent such abuses in the future.

FCC,—a trade union charged that a radio station was discriminatory in suppressing discussion of trade controversies, and was unfairly censoring scripts. The FCC ruled (June 26) that the code of the national broadcasters association, under which the station operated, providing that no time shall be sold for the discussion of controversial public issues and that only charities and certain commercial organs may solicit membership, is inconsistent with the statute. The commission said that the problem must be resolved by the management of each station, and not by any mechanical rule. The commission approved a stipulation whereby the union agreed to drop the charges against the station and the station promised to eliminate the code and discontinue its practice of "throttling" free speech: and to make time available on "a fair and just basis."

FCC,—radio-FM rules were announced on August 24, but the operation of the rules was postponed.

CAB,—the Civil Aeronautics Board on June 1 rejected the chosen instruments theory and left American participation in international service up to regulated competition. It divided the European zone into three routes allotted to three carriers subject to a seven years' limit. It also let one domestic line buy up an existing international line and use one of the three routes.

SEC,—on June 29 the commission held inadequate a statement that "these shares are offered for speculation" where no fuller data was given.

Hearings were held in Congress on the McCarran-Summers bill for systematizing administrative procedure, introduced into Congress in January with the backing of the American Bar Association and many other organizations. The bill marks the culmination of ten years of study. The Walter-Logan bill on the same subject was vetoed in 1937, pending the conclusion of these studies and the report of the attorney general's committee, which was filed in 1941. The bill has five features, namely: (a) publicity of administrative law and procedure, (b) minimum procedural requirements as to the two basic forms of administrative operation, general regulations and adjudication of particular cases, (c) judicial review, (d) incidental procedural rights pertaining to any kind of executive authority, (e) limitation upon the types of penalties administrative agencies may impose. The bill was reported favorably to the Senate on November 19.

(2) **Civil Actions, Practice and Procedure; Courts and Lawyers.**—Women cannot serve on juries in North Carolina. So ruled its Supreme Court on Nov. 8, 1944, relying on the provision in the state constitution that juries are to be composed of "good and lawful men," one judge vigorously dissenting. *State v. Emery*, 31 S. E. 2d 858.

By integrating its bar under legislation adopted February 26, West Virginia became the twenty-fifth integrated state in the Union, and the eighth east of the Mississippi.

Admission to the bar was made easier for returning war veterans in several states. Among others,—the New York Court of Appeals waived examination requirements for law school graduates having specified qualifications and an active service of a year or more; and accepted certain war experience as the equivalent of one year of college training. The Supreme Court

of Illinois permitted war veterans to take the bar examination if they have finished two thirds of a law school course. In the State of Washington legislation permitted graduates of law schools with one year's war service to be admitted on motion; but the Supreme Court of the state on August 30 ruled that the legislation is ineffective. The courts alone control admissions. *Re Levy and Warnock*.

Connecticut's legislature passed a law similar to the Washington act. So did Maine.

Many law schools also altered their admission requirements. At Harvard, where a college degree has always been a law school prerequisite, a year's active war service will now excuse the absence of a degree in the case of men having "equivalent" educational experience.

Under a constitutional amendment adopted in Texas the six members of the Commission of Appeals, created in 1918, now became justices of the Supreme Court, increasing to nine the previous three-judge court.

Collection agencies hiring lawyers to collect subscribers' claims were held by the Utah Supreme Court to be unlawfully practicing law. *State Bar v. Smith et al.* In New York the court of first instance sustained a complaint of the New York County Lawyers Association against Ola C. Cool, operating under the name of Labor Relations Institute, who was furnishing to a large clientele advice as to the action to be taken and avoided under statutes, decisions and regulations.

The federal rules of criminal procedure submitted to the Supreme Court in 1944 (*AMERICAN ANNUAL*, 1945, p. 413) were approved by the court (two justices dissenting) and filed with Congress in January, to become law unless disapproved before adjournment. These rules were drawn up by an advisory committee appointed by the court, in accordance with an act of Congress approved June 29, 1940, inspired by the success of the federal rules of civil procedure which became effective in 1938 by virtue of the act approved June 19, 1934. Thus was brought to a successful conclusion a process which had been actively going on for over eleven years as a result of a movement initiated at the American Bar Association convention of 1911. The rules regulate every stage of a criminal prosecution from the beginning to the end.

In Florida an eleven-member committee of the bench and bar was appointed in April to draw up a new set of civil procedural rules, in accordance with legislative authority vested in the court at the 1943 session of the legislature.

Erie R. Co. v. Tompkins, 304 U.S. 64, 82 L. ed. 1188, 58 S. C. Rep. 817, 114 A. L. R. 1487, which outlawed the "federal common law," was extended by *Guaranty Trust Co. v. York*, 89 L. ed. Adv. Op. 1418, 65 S. C. Rep. 1464, 13 L. W. 4564 (June 18) to apply state statutes of limitation to cases brought into federal courts because of diversity of citizenship. The court said:

"The nub of policy that underlines *Erie R. Co. v. Tompkins* is that for the same transaction the accident of suit by a nonresident litigant in a federal court instead of in a state court a block away should not lead to a substantially different result."

On the other hand a federal district court in New York ruled against requiring a litigant to post the security required by a state law in the case of a stockholders' derivative suit. *Boyd v. Bell*, 14 L. W. 2069. Nor will the federal court in a removed case assess statutory state

costs. *Vernon, etc. Corp. v. Hareen, etc. Co.*, 60 Fed. Sup. 555 (DC E.D. N.Y., July 24).

The denial of knowledge of something which a witness does know is perjury but is not punishable as contempt of court. *Re Michael*, 90 L. ed. Adv. Op. 15, 66 S. C. Rep. 78, 14 L. W. 4007 (November 5).

There were two interesting decisions in libel cases. In *Brown v. Mack*, 14 L. W. 2071 (N.Y. Supr. Court, July) a decedent's estate was held liable for a libellous statement in the testator's will. The court said that the executor must probate the will and had no duty to delete the words; he could properly distribute copies of the will to legatees, and was privileged against suit. The libelled wife might have procured a deletion had her attorneys or the executor's attorney known of a procedure to that effect which had been used in several cases, but never ruled on by the court. In *Wright v. Farm Journal*, 13 L. W. 2714 (DC N.Y., June 12) it was held that the false publication of a statement that a union leader is a "Communist Party leader" is libellous per se.

The federal district court in Illinois ruled in *Daily v. Parkes* in July that the Illinois anti-heart balm act was unconstitutional. The judge said:

"I cannot believe the legislature intended to enact a law which would result in the protection of persons guilty of alienating the affections of husband or wife and make it unlawful for an aggrieved husband or wife to seek any redress for such injury."

The CCA in the Third Circuit in September disclaimed any power to set aside a verdict simply because the damages were excessive. *Scott v. Baltimore etc. R.R.*

(3) Competition in Business—Fair Trade and Monopolies.—The Supreme Court of the United States filed decisions in several important antitrust cases. The most significant was undoubtedly *Associated Press v. U.S.*, 89 L. ed. Adv. Op. 1512, 65 S. C. Rep. 1416, 13 L. W. 4596, decided June 18, rehearing denied October 8.

The court affirmed the decree of a three-judge district court enjoining the organization from enforcing bylaws which put it in the power of business competitors to blackball new members. The AP is a co-operative nonprofit association, financed by assessments on the member newspapers to whom it furnishes its news services.

Speaking for the court Mr. Justice Black emphatically denied that newspapers have any special privileges under the Sherman Act. Handling news is no different from handling food. Freedom of speech cannot be used as a "shield for business publishers who engage in business practices condemned by the act." "Freedom to publish means freedom for all and not for some." "Freedom to combine to keep others from publishing is not" freedom to publish.

The objectionable bylaws prohibit members from distributing news to nonmembers, and though noncompeting papers can be admitted to membership on application without initiation fee or onerous terms, competing papers must run the gauntlet of competitors. The court had no doubt that the bylaws "had hindered and restrained the sale of interstate news to nonmembers who competed with members." The arguments that the owner of property should have the right to determine to whom he will sell, and that the AP is only one of several news gathering organizations, were summarily

dismissed on the basis of the size and complexity of the AP and its overwhelming dominance of the news field. Two judges filed concurring opinions; three judges dissented, one took no part.

Next in importance was the decision in *Georgia v. Pennsylvania R.R. Co.*, 89 L. ed. Adv. Op. 758, 65 S. C. Rep. 716, 13 L. W. 4287, decided March 26. Here the court gave leave to the State of Georgia to file a complaint invoking the original jurisdiction of the court under Article 3, section 2, of the Constitution for injunctive relief under the antitrust laws against a group of railroads which had set up joint rates which preferred the ports of other states over the ports of Georgia. The state charged that these rates were fixed by private agencies, unsanctioned by the Interstate Commerce Act, and prohibited by the antitrust acts. The court (by Mr. Justice Douglas) ruled that the state, as the representative of its people, had the right to proceed, on a showing that the economy of the state and the welfare of its citizens suffered from a conspiracy. Brushing aside procedural difficulties, the court pointed out that the state's only recourse was to the Supreme Court, the ICC having no jurisdiction to break up a conspiracy. The chief justice and three of his associates dissented on the ground that the state should take action before the ICC or in the district court, and had stated no basis for action by the Supreme Court. The governor of the State of Georgia argued the case for his commonwealth.

Other Supreme Court cases:

In *U.S. v. Frankfort, etc.*, 89 L. ed. Adv. Op. 649, 65 S. C. Rep. 661, 13 L. W. 4241, the Court decided on March 5 that liquor manufacturers and dealers could be convicted of a conspiracy in restraint of trade even though the conspiracy affected only intrastate sales, and the power to control intrastate liquor traffic is a matter for the states. The court found that the means adopted for the accomplishment of the conspiracy overlapped state lines. Outside manufacturers were hooked into the deal. There was no dissent.

In March the court applied the Clayton and Sherman acts to a conspiracy to create a monopoly in glass-making machines based in part on allotting production of unpatented articles to manufacturers licensed under patents. *Hartford Empire Co. v. U.S.*, 89 L. ed. Adv. Op. 302, 65 S. C. Rep. 373, 13 L. W. 4122.

On May 21 the court sustained an antitrust suit against export associations who were trying to control export and import markets in alkalis and fix prices in the United States. The defendants' claim that the court had no jurisdiction until the Federal Trade Commission (FTC) had made an investigation was denied. *U. S. Alkali etc. Ass'n v. U.S.*, 89 L. ed. Adv. Op. 1077, 65 S. C. Rep. 1120, 13 L. W. 4440.

In *Allen Bradley Co. v. Local Union*, 89 L. ed. Adv. Op. 1441, 65 S. C. Rep. 1533, 13 L. W. 4580, the court ruled in a declaratory action that a combination in New York City between unions and contractors to monopolize the electrical equipment market might be enjoined. The bona fide purpose of the union to raise wages and bring about better working conditions was held to be immaterial. The legislative purpose to preserve competition rises higher than the purpose to enable labor to better its condition by collective bargaining. Congress never "determined that labor unions

should be granted an immunity" under the Sherman Act, says Mr. Justice Black. Only one justice dissented.

But in *Hunt v. Crumboch*, 89 L. ed. Adv. Op. 1429, 65 S. C. Rep. 1545, 13 L. W. 4586, the court on June 18 refused to enjoin under the Sherman Act a union which refused to admit employees of a certain firm to membership or to contract with that firm, thus losing the firm a contract with a closed shop customer. The union was incensed at the employer because a union man had been killed in a strike against the firm and the union blamed the employer. Mr. Justice Black gave the court's opinion here as he had in the *Allen Bradley* case. Four justices dissented.

Lower federal courts filed four important decisions.

(a) The court enjoined and gave triple damages for a conspiracy to keep a rival concern from getting first run pictures, entered into by a company controlling all the first run theaters in Philadelphia and a company distributing 80 per cent of all pictures in the city. *William, etc. Theatre v. Loew's*, — Fed. 2d — (CCA No. 3, August 2).

(b) The "Chicago system" of release of motion pictures by arranging successive release weeks beginning with first run loop theaters and ending with general releases at descending prices was held contrary to the Sherman Act. *Bigelow v. RKO*, — Fed. 2d — (CCA No. 7, Aug. 3).

(c) The conviction of the three largest tobacco companies under the Sherman Act was upheld by the 6th CCA on the basis of evidence showing that the market price of tobacco was controlled by them, and that they maintained uniform sales prices; made identical and simultaneous price changes, and controlled retail sales by subsidies and coercion. The existence of a power to monopolize and the intent to so do constituted a violation of the act even if the power had not been exhausted. *American Tobacco Co. v. U.S.*, 147 Fed. 2d 93 (CCA No. 6, Dec. 8, 1944).

(d) Three companies in the titanium industry were held to have violated the Sherman Act by participating in worldwide agreements regarding patents and a division of territory. The court said that "every pound" of titanium "is trammelled by privately imposed regulation." *U.S. v. Nat. Lead Co.*, 14 L. W. 2068 (DC So. N.Y., July 5).

The Supreme Court of Massachusetts approved a Massachusetts statute which permits the court itself to investigate illegal monopolies. The argument to the contrary was that this violated the constitutional provision requiring the separation of powers. Conceding that the procedure is not judicial because it leads to no judgment, determines no rights, and results in a mere finding of fact, nevertheless the process puts information into the hands of the attorney general on which he has a statutory obligation to proceed. The court likens the whole thing to an inquest, or a bill of discovery, or a grand jury. *LaChapelle v. United Shoe, etc. Co.*, 61 N. E. 2d (May 2).

The Arkansas Supreme Court ruled against an Arkansas statute permitting taxicab operators a certain length of time to comply with certain city requirements prior to being allowed to continue to operate to the exclusion of later applicants. Competition is mandatory when public convenience and necessity may best be served by

it. The effect of the statute was to give a monopoly to the existing Checker cabs. *North Little Rock Tr. Co. v. City of N.L.R.*, 184 S. W. 2d 52 (Nov. 27, 1944).

The Wisconsin Supreme Court upheld the Wisconsin statute against deceptive or misleading advertising of optical products. A chain store optical company had advertised bifocal glasses at a low price as bait to draw customers into the stores where a prescription fee had to be paid despite representations to the contrary. *Ritholz v. Johnson*, 17 N. W. 2d 590 (February 13).

The "Hit Parade" which figured in litigation in 1944 (*AMERICANA ANNUAL*, 1945, p. 426) was again before the court several times. Judge Walter of the New York Supreme Court in *Advance Music Corp. v. Am. Tob. Co.*, 51 N.Y. Supp. 2d 692 (Dec. 1, 1944) ruled that a music publisher's amended complaint that the radio sponsor did not actually conduct a survey of songs for hits, omitted songs published by the plaintiff which should have been included, and failed to list certain songs in the proper order of popularity, stated a cause of action in unfair competition. This decision was contra to the decision of Judge Hecht of the same court on the complaint as originally drawn (50 N.Y. Supp. 287), which was followed by the federal district court.

Judge Walter said that publishers and sponsors do not compete with each other in the sale of songs, but they do compete with each other in creating the belief that certain songs are popular, and the modern law of unfair competition lays stress on the element of unfairness rather than on the element of competition.

Judge Walter's decision was reversed by the Appellate Division on Feb. 23, 1945 in *Advance Music Corp. v. Am. Tob. Co.*, 52 N.Y. Sup. 2d 337.

The court ruled that the complaint did not state a case for action for injunctive relief on the ground of unfair competition. The original complaint having been dismissed, the amended complaint which had been sustained by Judge Walter was now thrown out. The court said that in New York equity will not enjoin a disparagement of property. A tobacco company is not in competition with a music corporation. No cause of action to recover damages for fraud was stated because the plaintiff did not rely upon the defendant's statements. It was also held that the complaint did not state a cause of action for negligent use of words, because there was no duty shown.

(4) **Constitutional Law.**—Two states adopted new constitutions. The Missouri constitution was approved by a vote of almost two to one, carrying St. Louis and Kansas City and almost half the counties. A skillfully conducted publicity campaign, enlisting nearly all the newspapers in the state and statesmen of all parties and organizations, won out over an opposition based on the fear that negro and white children might attend the same schools, and that taxes would be increased. It was drafted by 82 delegates, equally divided between the political parties, the president of the convention being an anti-New Deal Democrat. The convention was in session for over a year. Three hundred seventy-seven proposals were considered. Public hearings lasted for three months. Eventually it was decided to submit an entirely new document instead of a series of amendments. The new constitution is about two thirds the length of

the old. Much obsolete matter (e.g., against dueling) was omitted.

Changes: women are to serve on juries; freedom of speech is extended to the radio; rights of employees to organize and bargain collectively are recognized; senatorial redistricting is to occur every ten years; seventy-odd state departments are reduced to a maximum of fourteen; a department of public health and welfare is set up; the Supreme Court is given power to make rules of practice and procedure, both civil and criminal; the nonpartisan court plan is confirmed and extended; magistrate courts replace justices of the peace; probate judges must be lawyers; the fee system of paying judges is abolished; the four large counties may draft county charters; absentee voting is extended; the legislature may permit exceptions to the provision of separate schools for white and colored.

As to taxation, a classified tax is substituted for the general property tax. Three classes of taxable property are specified: real, tangible personal and intangible personal; the legislature may provide certain further classifications. The maximum intangible tax is 8 per cent of yield. Intangible taxes are to be collected by the state and returned, less 2 per cent, to the subdivisions; reforestation is encouraged.

In Georgia fifty amendments to the constitution were adopted August 7. These were drafted by a revision commission of 23 members. The constitution of 1877 was lumbered with obsolete provisions and amendments, shackling the governor, limiting the purposes for which public funds could be appropriated, and curtailing the authority of local governments.

The amendments fall into four classes. First, as to the political system: elimination of the poll tax; establishment of a genuine literacy test; ending of special tax exemptions to favored corporations; prohibition against changing the term of a local official without a referendum.

Second, as to efficiency in state government: Supreme Court increased from six to seven to avoid deadlocks; the system of allocation of state revenues abolished; the budget system which has reduced the state debt 80 per cent in two years, written into the constitution; a merit and retirement system for state employees authorized; the office of lieutenant governor created.

Third, as to municipalities and counties: a mandatory home rule section; permission to make zoning laws; the purposes for spending tax revenues expanded; bond limits increased.

Fourth, the governor is prohibited from vetoing constitutional amendments, and future constitutions must be submitted for ratification.

In the Supreme Court of the United States was a series of criminal law cases involving questions of constitutional law.

On January 8 the court decided in *Williams v. Kaiser*, 89 L. ed. Adv. Op. 362, 65 S. C. Rep. 463, 13 L. W. 4112, and in *Tomkins v. Missouri*, 89 L. ed. Adv. Op. 370, 65 S. C. Rep. 370, 13 L. W. 4111, that under the 14th Amendment the accused in a capital case is entitled to counsel and this right will be enforced in the federal courts if a state court is remiss in that respect in reliance on a state statute which specifies that counsel shall be assigned only when requested. The court brushed aside technical and procedural imperfections in the record. "We can hardly demand of a layman and pauper who

draws his petition behind prison walls the skill of one trained in the law."

In *Rice v. Olson*, 89 L. ed. Adv. Op. 903, 65 S. C. Rep. 989, 13 L. W. 4370, the court on April 23 freed an Indian who had been convicted of burglary in a state court where he had not been advised of his rights to counsel.

In *White v. Ragen*, 89 L. ed. Adv. Op. 932, 65 S. C. Rep. 978, 13 L. W. 4383, the court on April 23 was unable to free prisoners whose counsel had misrepresented them, because the prisoners had not exhausted the possibilities of proceeding for relief in the state court.

On May 7 in *Screws v. U.S.*, 89 L. ed. Adv. Op. 1029, 65 S. C. Rep. 1031, 13 L. W. 4397, the court ruled constitutional Section 20 of the Criminal Code, which makes it a federal crime to deprive a person of rights granted by the federal laws and constitution; but freed a sheriff who had blackjacked an accused thief. The trial judge had failed to instruct the jury that the sheriff was not guilty unless he purposed to deprive the person of his constitutional "right to be tried by a court rather than by ordeal."

The inadmissibility of an involuntary confession, which has been the subject of several recent decisions, was further defined in *Malinski v. People*, 89 L. ed. Adv. Op. 738, 65 S. C. Rep. 781, 13 L. W. 4279 (March 26). *Malinski* claimed that his confession was coerced and therefore that admitting it in evidence in the state court was a denial of due process of law. The Supreme Court found not only evidence of coercion but also concessions to that effect in the prosecutor's argument to the jury and therefore reversed the conviction, although there was a plethora of other evidence of guilt. On the authority of the *Malinski* case the eighth CCA reversed on July 2 a conviction of a defendant whose previous conviction was based only in part on a confession obtained by coercion. *Bayless v. U. S.* 150 Fed. 2d 236.

The constitutional requirement that treason must be proved either by two witnesses to the same overt act or by confession in open court was discussed in *Cramer v. U.S.*, 89 L. ed. Adv. Op. 937, 65 S. C. Rep. 918, 13 L. W. 4357 (April 23). The petitioners were released because the majority of the court failed to find the presence of the necessary requirements. The opinion is a landmark in its discussion by Mr. Justice Jackson of the history of the constitutional provision. Four judges dissented and pointed out that Cramer's own testimony amounted to a confession in open court. Cramer was a naturalized German who had served in the German Army in the First World War, and was in communication with one of the saboteurs sent here from Germany to disrupt our war industries.

The Fifth Amendment was interpreted in two cases. In *U. S. v. Willow River, etc. Co.* 89 L. ed. Adv. Op. 709, 65 S. C. Rep. 761, 13 L. W. 4261 (March 26) the court held that damage from the government's raising the water level of a navigable stream causing a diminishing of a power plant's capacity to generate electric power is not compensable under the Fifth Amendment. There is no taking of private property. Two judges dissented on the ground that the ruling to the contrary in *U.S. v. Crass*, 243 U. S. 316, had properly stood unquestioned for 28 years.

The court applied the same doctrine to its decision on the same day in *U.S. v. Commodore Park, Inc.*; 89 L. ed. Adv. Op. 722, 65 S. C. Rep. 803, 13 L. W. 4300. Here a riparian owner of

lands abutting on a navigable stream sought compensation because the government deposited in this stream materials dredged from navigable tidewater. Although as a fact the deposited material destroyed the navigability of the creek, nevertheless damages were denied because the work was done in furtherance of the public right of navigation, and was not therefore a mere taking of private property.

The court did not apply the 14th Amendment in *re Summers* 89 L. ed. Adv. Op. 1304, 65 S. C. Rep. 1307, 13 L. W. 4518 (June 11) to protect an applicant for admission to the bar who had been rejected by the bar examiners because he was a conscientious objector, although otherwise fitted. The court ruled that it could review the decision of the Illinois Supreme Court in the matter, but said that: "the responsibility for choice as to the personnel of its bar rests with Illinois. Only a decision which violates a federal right" would require the court's intervention. Discrimination against an applicant to the bar on the ground of religion might be objectionable, but refusing admission to a citizen unwilling to fight is proper. Four judges dissented on the ground that the real objection to the man's application appeared to be his religious belief.

The Commerce Clause was interpreted on June 18 in *Southern Pacific Co. v. Arizona*, 89 L. ed. Adv. Op. 1469, 65 S. C. Rep. 1515, 13 L. W. 4588. The court invalidated an Arizona law prohibiting the operation of railroad trains of more than 14 passenger cars or 70 freight cars. Analyzing the clash between state and national interests in the protection of interstate commerce from local interference, the court concluded that in this particular case "the state does go too far."

Civil rights were vindicated (or weakened according to the way you look at it) by the decision in *Bridges v. Wixon*, 89 L. ed. Adv. Op. 1489, 65 S. C. Rep. 1443, 13 L. W. 4554 (June 18). A deportation order had been based on the charge that Bridges was affiliated with the Communist Party which advised and taught the overthrow by force of the government of the United States. The order had been approved by a federal board and by the attorney general. In canceling the order Mr. Justice Murphy's concurring opinion says: "the record in this case will stand forever as a monument of man's intolerance of man." The decision was based on the theory that deportation is a penalty, and that meticulous care had not been used in obtaining definite evidence against Bridges. The use of unsworn, unsigned statements to prove his membership in the Communist Party was stigmatized. Three judges dissented.

The divorce difficulties of one Williams and his wives were again before the Court in *Williams v. N. Carolina*, 89 L. ed. Adv. Op. 1123, 65 S. C. Rep. 1092, 13 L. W. 4424 (May 21, rehearing denied October 8).

The court restored the law substantially to its status prior to the court's decision in an earlier case between the parties. That was *Williams v. N. Carolina*, 317 U.S. 287, where (somewhat to the surprise of lawyers generally and considerably to the joy of many divorced persons), the court reversed a North Carolina judgment convicting Williams and his second wife of bigamy. In the earlier case the court had ruled that North Carolina must give full faith and credit to the Nevada divorce. In the present case the court said that the earlier decision had been based on an incomplete record, and now the court affirmed the conviction.

In this second case North Carolina challenged the findings of the Nevada court that the Williamses had acquired domicile in Nevada. Williams and his second wife left North Carolina for the purpose of getting Nevada divorces, and thereupon they married in Nevada and returned to North Carolina. The court now affirmed the long-established principles that jurisdiction for divorce depends on the bona fide domicile of at least one of the parties in the divorcing state, and that a second state is not bound by the decision of the divorcing state on this question of fact, but can re-examine it. Nevada had no power to liberate the North Carolina Williamses from the North Carolina law governing domestic relations.

Uncontested divorces "based upon fraudulent domiciles are now and always have been subject to later re-examination with possible serious consequences." Three judges dissented, fearing the widespread consequences following the decision which might fall upon innocent parties, and deploring the diminution of state power over marriage and its dissolution. One of the dissenting judges questioned the validity and propriety of resting jurisdiction in divorce on domicile.

Commonwealth v. Esenwein, 348 Pa. 455 (AMERICANA ANNUAL 1945, p. 413), was affirmed by the Supreme Court, 89 L. ed. Adv. Op. 1152, 65 S. C. Rep. 118, 13 L. W. 4439 (May 21). A Nevada divorce had been obtained by Pennsylvanians who went there for the purpose. The divorce was not recognized in Pennsylvania.

The New York Supreme Court in *Sodero v. Sodero*, 56 N.Y. Supp. 2d 823 (June 14) held that an Arkansas marriage after an Arkansas divorce of persons domiciled in New York was void in New York. The court called it contrary to the natural law as codified in the Ten Commandments. There is only one ground for divorce allowed by the statutes of New York to New York residents—infidelity.

On the other hand, the state of Washington Supreme Court recognized a Louisiana divorce obtained by a Louisiana resident, notwithstanding that in accordance with Louisiana law no notice was given to the absent spouse. Louisiana law controlled as to service of process in a proceeding brought there by a Louisiana resident. *Codling v. Codling*, 160 Pac. 2d 635, (July 5).

During the year New Mexico, Virginia and Montana invalidated absentee ballot laws as being unconstitutional, but the Kentucky court approved the Kentucky statute.

In a six hundred page opinion Judge Thompson of Virginia in *Staples v. Gilman*, 32 S. E. 2d, 129 (November 1944), said that the legislature can limit the territory of a constitutional convention, and in the second decision on the same case, 33 S. E. 2d 49 (February, 1945) the court upheld the power of the legislature to call a constitutional convention merely to repeal and cancel the poll tax for men in the armed services.

The federal government may incorporate survivorship provision in bonds in spite of a state statute of descent and inheritance. The federal constitutional power to borrow is one reason; the fact that bonds are federal contracts is another. *Ervin v. Conn.*, 34 S. E. 2d 402 (Supreme Court N.C., June 6).

The Illinois Supreme Court invalidated a provision of the Illinois currency exchange act requiring applicants to give "such other informa-

tion as the auditor may require" on the ground that this unlimited power amounted to a delegation of a legislative function. The rest of the act was sustained. The business of providing facilities for cashing checks is properly a subject for licensing under the police power, and notwithstanding the equal protection clause of the constitution, the American Express Company, the Postal Telegraph Company and Western Union Telegraph Co. may properly be exempt. *McDougall v. Lueder*, 389 Ill. 141, 58 N. E. 2d 899, 156 A. L. R. 1059 (January 17).

Constitutional liberties are not infringed by a state law banning high school fraternities and sororities. *Satan Fraternity v. Board*, 22 S. E. 2d 892 (Supreme Court, Florida, August). Attending public school is not a right but a benefaction and the state can properly impose conditions. Whether high school societies are purely social is a question of fact which the legislature can properly answer.

The right of privacy seems to extend to a person's dog; anyway, in *Lawrence v. Ylla*, 55 N.Y. Supp. 2d 343 (Supreme Court, New York, April 12) an injunction issued against the sale by a photographer for use in an advertisement of a dog's picture made for the owner.

The New York statute making it a misdemeanor to have for sale publications regarding deeds of bloodshed, lust or crime was approved by the Court of Appeals in *People v. Winters*, 14 L. W. 2114 (July 19). The court disregarded the argument that the statute ought to discriminate between truth and fiction.

(5) **Criminal Law.**—In addition to criminal law cases discussed above under *Constitutional Law*, two Supreme Court cases deserve mention.

On June 11 in *Keegan v. U.S.*, 89 L. ed. Adv. Op. 1314, 65 S. C. Rep. 1203, 13 L. W. 4534, the court reversed the conviction of 24 Bundists for conspiracy to persuade the evasion of military service where it appeared that the evasion was counseled for the purpose of testing the constitutionality of the Selective Service Act, and the trial judge had told the jury that this was immaterial.

The Mann Act was held to apply to transportation of women for immoral purposes wholly within the District of Columbia in *U.S. v. Beach*, 89 L. ed. Adv. Op. 574, 65 S. C. Rep. 602, 13 L. W. 4232 (February 26).

But in *LaPage v. U.S.*, 146 Fed. 2d 536, 156 A.L.R. 965 (CCA No. 8, January 10) a madame who telephoned a former inmate to return to her job from another state at her own expense was freed from the charge of "causing" white slave traffic.

In *Winebrenner v. U.S.*, 147 Fed. 2d 322 (CAA No. 8, February 14) it appeared that during the course of a trial which lasted seven weeks the district judge told the jurors not to discuss the case to such an extent that fixed ideas would be formed which would prevent them from changing their minds after hearing all the evidence. This was held erroneous because it implied that the jury might form an opinion so long as it was not fixed. The CCA felt that this change in effect shifted the burden of proof.

In *Ruhl v. U.S.*, 148 Fed. 2d 173 (CCA No. 10, March 14) the court said that notwithstanding the McNabb case (*AMERICANA ANNUAL* 1945, p. 412) a confession obtained two days after arrest and prior to arraignment on a murder charge may be admitted. The prisoner here was well treated and well advised and none of the practices condemned in the McNabb case

were used in obtaining the statement. The McNabb case does not impose the requirement of prompt arraignment as a *sine qua non*; it was aimed at other conditions.

North Dakota v. Colliton, 17 N. W. 2d, 546; 156 A. L. R. 1403, (N.D. Supreme Court, February 8) interpreted the "Uniform Illegitimacy Act." It was held that a child begotten to a married woman by her paramour is a child "born out of wedlock" within the purview of a statute making the father of a child born out of wedlock liable for maintenance, education and support.

(6) **Labor.**—Labor law is developing fast. From the many decisions by the Supreme Court of the United States during the transition year 1945 the following established definite points.

In *Thomas v. Collins*, 89 L. ed. Adv. Op. 340, 65 S. C. Rep. 315, 13 L. W. 4097 (January 8) the court invalidated a Texas statute which prohibited labor organizers from soliciting memberships in labor organizations without first obtaining a state license card. The court said that the statute restrained the rights of free speech and free assembly. The practical effect of the restriction would be to prohibit a person from advocating trade unionship without having first procured a card. Four judges dissented.

In *Western Union Tel. Co. v. Lenroot*, 89 L. ed. Adv. Op. 289, 65 S. C. Rep. 335, 13 L. W. 4106 (January 8) the court failed to find in the Fair Labor Standards Act any prohibition against child labor in the delivery of telegraph messages. To the "baffling inquiry as to what, if anything, moves across state lines in the telegraphic process" the court was unable to give an answer, but concerned itself with the wording of the statute. Four judges dissented.

This same act had been interpreted on Nov. 6, 1944 in *Walling v. Helmerich*, 89 L. ed. Adv. Op. 1, 65 S. C. Rep. 11, 13 L. W. 4002, to prohibit a split pay plan whereby the rates of pay did not represent the rate actually paid for ordinary nonovertime hours, and did not allow extra compensation for true overtime hours. The purpose of the scheme was to perpetuate a pre-statutory wage schedule.

In *Gemsco v. U.S.*, 89 L. ed. Adv. Op. 593, 65 S. C. Rep. 605, 13 L. W. 4214 (February 26) the court interpreted this same statute to permit the administrator to prohibit home work which was circumventing an order prescribing minimum wages. Only two judges dissented.

In *Jewell Ridge v. Local No. 6167*, 89 L. ed. Adv. Op. 1543, 65 S. C. Rep. 1550, 13 L. W. 4389 (May 7) "work" under the same statute was defined to include underground travel. Four judges dissented.

On June 11 the court interpreted the same act to apply to employees engaged in the maintenance and operation of a building. More than half the building was an office building used by a company engaged in interstate commerce. In this building was carried on the supervision of factories scattered over the country and over the shipment of their products from state to state. Two judges dissented. *Borden v. Borella*, 89 L. ed. Adv. Op. 1240, 65 S. C. Rep. 1223, 13 L. W. 4493.

On the same day in *10 E. 40th Street Building v. Callus*, 89 L. ed. Adv. Op. 1244, 65 S. C. Rep. 1227, 13 L. W. 4516, the court, with four judges dissenting, dismissed a case which sought to apply the statute to an office building in New York leased to more than a hundred tenants pursuing a great variety of enterprises. No manu-

facturing was carried on. Four judges dissented on the basis that the statute should apply to all employees "necessary to the production" of goods for commerce, and not merely to those engaged in manufacturing. Both majority and minority opinions concur in declaring the difficulty of drawing lines, and the majority report concedes that when drawn the lines are bound to appear arbitrary.

On the same day in *Elgin, etc. R. Co. v. Burley*, 89 L. ed. Adv. Op. 1328, 65 S. C. Rep. 1282, 13 L. W. 4482, the court remanded for further proceedings a suit brought by individual employees subsequent to a decision of the adjustment board under the Railway Labor Act, because the record did not show whether the employees had authorized the settlement against which they were now contending. The court said that the statute does not require individual employees to be bound by the action of the union in the handling of a grievance or individual claim.

Also, on the same day in *Hill v. Florida*, 89 L. ed. Adv. Op. 1258, 65 S. C. Rep. 1654, 13 L. W. 4529, the Florida statute regulating labor union activities was partially invalidated. Section 4 of that act prohibited labor union business agents from serving for pay without first obtaining a state license. The court said that this section circumscribed the "full freedom" which the Wagner Act confers on workers in the selection of collective bargaining agents of their own choice. Repugnancy of the state act to the National Labor Relations Act was also found in another section of the state act which imposes penalties upon labor unions who fail to file certain reports with the secretary of state. This section constitutes an obstacle to collective bargaining. The Chief Justice dissented as to this latter section. Reconsideration was refused, October 8.

In *Armour v. Wantock*, 89 L. ed. Adv. Op. 120, 65 S. C. Rep. 165, 13 L. W. 4028 (Dec. 4, 1944) the court had applied the act so as to hold compensable as overtime the additional time during which employees were engaged in standby service; and in *Skidmore v. Swift & Co.*, 89 L. ed. Adv. Op. 125, 65 S. C. Rep. 161, 13 L. W. 4030, on the same day the court made a similar decision where the administrator had ruled that time spent sleeping and eating should be excluded from the work week, but other on-call time should be included.

The Supreme Court unanimously refused on June 11 to take jurisdiction of a declaratory judgment proceeding to reverse the Alabama *McAdory* case (*AMERICANA ANNUAL*, 1945, p. 418). *Alabama S.F. of L. v. McAdory*, 89 L. ed. Adv. Op. 1270, 65 S. C. Rep. 1384, 13 L. W. 4541.

Some cases in the lower federal courts: In *NLRB v. Atkins & Co.*, 147 Fed. 2d, 730, the 2d CCA in February ruled that plant guards have no collective bargaining rights. The court said that the whole relationship is dominated by the army.

In *NLRB v. Cowell, etc. Co.*, 148 Fed. 2d 237, the 9th CCA on March 6 ruled that a business which has discontinued trading across state lines is still a business affecting interstate commerce if it has labor disputes.

As to peonage, in *Pierce v. U.S.* 146 Fed. 2d 84, the 5th CCA upheld on Dec. 4, 1944, a finding of guilty where the testimony was that the defendant got vagrant women out of jail by paying their fines, took them to his roadhouse and would not let them leave as long as they

were in debt to him for the fines and the cost of their clothing. The girls "engaged in the activities of the roadhouse."

In *Stapleton v. Mitchell*, 60 Fed. Sup. 51 (DC Kan., March) parts of the Kansas Union Control Act were held unconstitutional; e.g., a section requiring majority vote for a lawful strike; a section making it unlawful to refuse to work on goods because they are not union produced; a section prohibiting stoppages or strikes because of jurisdictional disputes. These activities are within the protection accorded to free speech. The court, however, refused to nullify the act as a whole under the equal protection clause of the constitution. Advocacy of labor unions is proper, but union activities may be regulated in the public interest on a reasonable basis.

An unincorporated union may be sued for a declaratory judgment by an employee on behalf of himself and others, and process served upon subordinate locals or union representatives. *Tunstall v. Brotherhood*, 148 Fed. Sup. 403, (CCA No. 4, April 9). This case involved the race question and was before the Supreme Court at an earlier stage. (See *Race Problems*, below.)

A nonprofit charitable hospital in the District of Columbia was held subject to the National Labor Relations Board (NLRB) because hospital activities are trade and commerce, and such institutions are not exempted by the act. *NLRB v. Central, etc. Hospital*, 145 Fed. 2d 852 (CCA D.C., Nov. 13, 1944).

An employer's explanation of his position prior to an election, sent by letter to all employees, is proper but the activity of supervisors in getting out the vote and in implying that the employer was anti-union, is illegal. The supervisor had explained, by use of a sample ballot, how to vote, and had pointed out that benefits might be withdrawn. *Big Lake Oil Co. v. NLRB*, 146 Fed. 2d 967 (CCA No. 5, January 29).

As to workmen's compensation—a statute prohibiting self-insurers from engaging service companies to look after workmen's compensation claims is constitutional, as a reasonable exercise of the police power. The legislature properly concluded that these service companies would tend to prevent workmen from receiving adequate compensation for injuries. The theoretical supervision by the Industrial Arbitration Board (IAB) is insufficient to control abuses. Most cases have to be disposed of without close supervision by the board. *Independent Service Corp. v. Toussant*, 149 Fed. 2d 204 (CCA No. 1, May 4).

The mate of a tug is not a member of the crew under the Longshoremen's Act. The general nature of the man's duties is not the test. The correct test is his duties on the day of the accident. *Long Island RR Co. v. Lowe*, 145 Fed. 2d 517 (CCA No. 2, Nov. 24, 1944).

The following are some state court cases: Colorado invalidated compulsory incorporation of unions. *AF of L. v. Reilly*, 155 Pac. 2d, 145 (December 1944). In this case the Colorado statute was held unconstitutional on the ground of denying the right of free speech, press and assembly to labor unions. Other sections tied to this requirement were also held invalid. By limiting the right to engage in certain types of union activity to incorporated unions the statute unlawfully denies the privilege to others. Requiring incorporation imposes a fundamental change in the form of voluntary associations of workmen as a prerequisite to the right to picket and assemble.

The court refused, however, under the declaratory judgment act to determine the constitutionality of unenforced provisions of the act defining unfair labor practice. The court dodged deciding "a speculative inquiry" as to which "concrete situations not yet developed." Three judges dissented in part.

Supplementing the decision in *James v. Mar-
inship Corp.*, 155 Pac. 2d 329 (Dec. 30, 1944), the California lower court ruled that a union maintaining a closed shop and closed union is subject to injunction if it refuses membership to independent distributors of milk, and seeks to prevent milk brokers from selling milk to them. The union had closed shop contracts with 95 per cent of the brokers in the area. It wanted to make independent distributors driving their trucks to employ union drivers. The court said that:

"The elimination of such persons from our economic life is no more a legitimate object of union activity that would be elimination of negroes. *Bautiste v. Jones*, 155 Pac. 2d 373 (Dec. 30, 1944)." (Rehearing denied, Jan. 29, 1945.)

On February 21 the California Superior Court in *Warren v. Screen Office Guild*, 13 L. W. 2473, approved an assessment upon union members to support candidates in a state election. The court said that this assessment does not interfere with the right of suffrage, and there is no provision of California constitution or law similar to the federal acts, which prohibit the use of union funds to support political candidates. Equitable relief against the union officials on the ground that under the union constitution, union money could not be used to support state candidates, was denied because the facts show that the money was actually used to defeat an anti-closed shop proposition, and only incidentally to elect candidates.

On the other hand, in *Trent v. Industrial Union* (no opinion filed, cited in *Monthly Labor Review*, January 1945, p. 128), the California Superior Court issued a temporary injunction against using union funds or special assessments in congressional elections, but refused an injunction against the use of such funds to fight a constitutional amendment.

This matter of assessments was ruled upon by the California Supreme Court on January 20, in *DeMille v. Am. Fed. of R. A.* The court said that a labor union may punish a member who refuses to pay assessments levied to finance a campaign to defeat an anti-closed shop proposition. The court differentiates the case from spending union funds to elect or defeat any particular candidate. The union constitution permitted expending funds for department purposes "as long as it is not used in political activities." The court said that support of legislative measures is not a political activity. Moreover, the fact that some of the organization favored the legislation did not prevent funds of the organization being spent in accordance with the vote of the majority. The federal act against union contributions does not affect a state election even though the proposition was on the same ballot with federal candidates.

The California district court of appeal invalidated a maintenance of membership provision added by an arbitrator to a collective bargaining contract. This provision would limit the employer's exclusive right to hire and fire. The contract forbade any arbitration which would "arbitrate away any provisions of the contract." *Consolidated Vultee, etc., Corp. v. United, etc. Workers*, 14 L. W. 2008 (June 4).

In *Szabo v. Pa. R. R. Co.* 40 Atl. 2d 562, on January 4, the New Jersey Court of Errors and Appeals reinstated a jury verdict allowing recovery where a worker was taken suddenly sick on the job and was taken home by the gang, but was left at home with no one to take care of him so that he died. It is up to the employer to see the employee reasonably safe through an emergency which develops on the job.

Some significant administrative decisions: On June 25 the National Labor Board refused to take jurisdiction over a local transit company union all of whose routes crossed state lines. The effect on interstate commerce was felt to be too remote to bring the company under the statute. Two cases where the board had taken jurisdiction were distinguished as involving connecting carriers or carriers of workmen to factories producing interstate commerce goods.

Merely talking against union contracts and expressing a preference for dealing direct with employees is proper. This was held by the board on July 4. The employer had sent out letters and bulletins, but had made no threats.

A nonprofit association was treated as an employer because of interference with union organization, in *NLRB v. Holtville Ice Co. et al.*, 51 NLRB No. 103.

In *re Reliance Mfg. Co.* on February 28 an employer was ordered by the NLRB to reinstate a forewoman who had been discharged for refusal to make an anti-union speech. She was not a union member.

In the Packard Motor Car Co. case on March 26, the Foremen's Association of America persuaded the NLRB to certify it as a bargaining agent for company foremen. This was a reversal of the board's position in the Maryland Dry Dock case in which it decided that the establishment of foremen units would impede collective bargaining and disrupt techniques. The board in the Packard case found that a foreman in a modern plant is merely a plant policeman following a policy set by higher officials, enforcing these policies through rigidly fixed procedures. Plant policy and technique, not the individual man, control the situation. The board said that the interest of the foreman as an employee has changed, and the trend among foremen to seek the opportunity for collective bargaining has been strong and consistent. Unions which include both foremen and workers will not be certified as bargaining units. Foremen's unions do not threaten harm merely because the foremen are organized. Foremen in big industries correctly consider themselves a little group. Their interests as workers warrant their binding themselves together for collective bargaining.

(7) **Legislation, Federal.**—The decision, and even more the statements by the justices, in *U.S. v. Southeastern, etc. Association*, 88 L. ed. Adv. Op. 1082, 64 S. C. Rep. 1162, 12 L. W. 4451 (*AMERICAN ANNUAL*, 1945, p. 411), declaring that insurance is interstate commerce caused consternation in the insurance business throughout the country. For the present at least, some of the worries were assuaged by the passage of P. L. 15, S. 340 (March 9).

This act declares that the continued regulation and taxation by the several states of the business of insurance is in the public interest, and that silence on the part of the Congress shall not be construed to impose any barrier to the regulation or taxation of such business by the several states. The statute goes on to say that the business of insurance, and every person en-

gaged therein, shall be subject to the laws of the several states which relate to the regulation or taxation of such business.

No act of Congress shall be construed to invalidate, impair or supersede any law enacted by any state for the purpose of regulating the business of insurance, or which imposes a fee or tax upon such business, unless such act specifically relates to the business of insurance; provided, however, that after Jan. 1, 1948, the Sherman Act, the Clayton Act, and the Federal Trade Commission (FTC) Act, shall be applicable to the business of insurance to the extent that such business is not regulated by state law. Until that date these acts and the Robinson-Patman Act shall not apply to the business of insurance, with certain provisos.

Several acts continuing war agencies and war measures were enacted; namely, the Commodity Credit Corporation; the Lend-Lease Act; the Smaller War Plants Corporation; the Selective Training and Service Act; the statute of limitations with reference to the Pearl Harbor debacle; and the Emergency Price Control Act. Added to the federal criminal law was a statute defining the crime of aiding in the escape of prisoners of war.

The Bretton Woods Agreement and the San Francisco Charter of the United Nations were both approved.

P. L. 67, H. R. 2068, approved May 29, enacted a military personnel claims act to provide for the settlement of claims of military personnel and civilian employees of the War Department, and army, for damage, loss, etc., of personal property occurring incident to their service.

An act, approved July 1, reclassified the postal service, established uniform procedure for computing compensation and generally raised pay; and approved June 30 was a general Federal Employees Pay Act, increasing salaries, improving working conditions and at the same time reducing federal personnel.

The first week in October was established annually as National Employ the Physically Handicapped Week by an act approved August 11.

National daylight saving or war time went out on Sept. 30, 1945, by practically unanimous congressional action.

For the duration of the war the exercise of certain functions of the president with respect to courtmartial was delegated to the Secretary of War and his Under-Secretary, and to the Secretary of the Navy and his Under-Secretary; that is, functions of confirmation, of commutation and of sentences except those of death. Executive Order No. 9556, 10 F. R. 6151, May 26.

To meet a political exigency with reference to the nomination of former Vice President Wallace as Secretary of Commerce, P. L. 109, S. J. R. 65, approved June 30, transferred to the Reconstruction Finance Corporation (RFC) certain of the sub-corporations set up under the RFC.

(8) **Legislation, State.**—Every legislature in the country was in session in 1945. A mass of legislation was enacted—just as a sample, 1,500 laws in California. The Connecticut legislature adopted the traditional device of setting the hands of the clock back at its last session so that many laws were actually passed after the expiration of the legal session of the legislature at midnight on June 6. The Connecticut Bar Association requested the governor to call a special session of

the legislature to validate this legislation which included the state budget, the election of two judges and various important laws, but the governor determined that no emergency existed and declined to call a session of the legislature unless later court action should make it necessary.

Most of the legislation, much of it not published until too late for review here, comprised acts merely tinkering existing statutes. These generally require no mention. But there were some laws which deserve comment because of their novelty or because they make fundamental changes or show significant trends. Sometimes the very fact that a proposed law failed of passage is of real importance, as was pointed out by Bethune Jones in an article on legislative trends in *American Law and Lawyers*, September 18.

Some of the high spots in the year's legislative activities will be here classified alphabetically.

Administration and Government.—A tendency was discernible to systematize the work and directives of state boards, commissions, and executives. In California for instance, administrative decisions are henceforth to be made only after stated proceedings conducted by trained hearing officers. A division of administrative procedure is set up, and court reviews are provided for. Other states; for example, Connecticut, Illinois, Nebraska, require filing of certified copies of administrative rulings in order to make them valid. Several states (for example, New York, Vermont) permit local governmental units to accumulate reserve funds for paying bonded indebtedness and other purposes. To accumulate money by taxation to meet anticipated future expenditures is a concept slow of acceptance in American local government.

Advertising and Publicity.—Maine, New Hampshire, Virginia, Florida, and a very few other states, have for many years gone out for the vacationing tourist through state publicity. State appropriations for this purpose were increased in these states, and other states entered the same field. Michigan, West Virginia and Iowa created state tourist or publicity councils. Similar bills were proposed in at least four other states, and about two thirds of the states now have publicity agencies, and substantially all the states advertise.

Architecture.—Maine created a state board of architects.

Automobiles.—Financial responsibility laws have been more popular than ever this year. Several states (for example, Nebraska, Minnesota and Georgia) set up laws of this type, although other states (Arizona, Nevada and North Carolina) rejected the proposition. Starting in New Hampshire in 1937 there are now nearly twenty states with such laws.

Aviation.—Congress having as yet placed no effective limit on the power of states to regulate aviation, and no progress having been made toward adopting uniform state legislation on the subject, the states have been following separate courses. Several states this year (for example, Vermont, Washington) passed revised laws regulating aviation and authorizing airports. Wisconsin now permits reciprocal airports by local government agencies of that state in connection with similar units in other states. Washington passed the model airport zoning act, and created an advisory aeronautics committee.

Banking.—Wisconsin was added to the states which license community currency exchanges. New Mexico set up provisions organizing credit

unions. New York permitted nonresident American banks and trust companies to act generally in that state as fiduciaries where the home state is reciprocal. The previous law related merely to executors and trustees. Michigan added the now frequent provision indemnifying bank directors for expenses incurred in litigation clearing them from statutory liability.

Committees, Commissions, Councils.—Committees for investigating and reporting recommendations to subsequent legislatures were set up in many states; for example, Idaho for its educational system; Vermont to survey hospitals; West Virginia to inquire into health insurance plans; North Carolina for domestic relations, and for forestry practices; Virginia for health benefits to veterans; Washington for its educational system; Pennsylvania for insurance company regulation; Arkansas for statute revision; Connecticut for probate law and procedure; Vermont to study finances and to study the need of boiler inspection, and a commission to revise the statutes of the state; Colorado to investigate the functions of the three branches of state government. Judicial councils to suggest improvements in court procedure were constituted in Georgia, New Hampshire and Vermont. Virginia set up a pardon and reprieve board. Arkansas created a state apriary board, and Vermont a development commission.

Constitutional Law.—New Hampshire submitted to the election of November 1946, the question of calling a constitutional convention. Similar propositions were defeated in Kansas, Florida and Alabama. A seven-member commission will submit suggested changes to the legislature of 1947 in Tennessee. An Illinois constitutional convention was proposed, but the legislature substituted a proposed amendment which would make it easier in the future to amend the present constitution. The New Jersey legislature turned down an effort in that state to reinstate the proposition for amending the constitution, which was defeated in November 1944.

Courts and Civil Actions.—Massachusetts now permits exceptions in lieu of appeal in both probate proceedings and suits in equity; also provides that verdicts shall not be set aside solely on the ground of inadequacy of damages until the parties have first been given an opportunity to accept such additional amount as the court adjudges reasonable; and that new trials for inadequacy of damages may be granted simply on the question of the amount of damages. The provisions for declaratory judgments are extended to "any case in which an actual controversy has arisen," removing the previous limit that the procedure must interpret a written instrument. A law now forbids the use in evidence in personal injury cases of written statements signed by a party to the action unless a copy of such statement is furnished to the party making the statement or his attorneys within ten days after written request. Vermont passed a law dispensing with the necessity of taking formal exception to rulings of a court during a trial. The Texas legislature killed a bill to take the rule-making power away from the courts.

Arizona, Colorado and Delaware are added to the states which now permit women to serve on juries. Illinois provided for declaratory judgments in certain designated cases. In Maine a small claims procedure leading to a summary judgment was adopted.

In New York a defendant may now demur to any count in an indictment. Vermont amended

numerous provisions regulating courts and judicial procedure.

Criminal Law and Procedure.—As a result of the scandal arising from the bribery of college basketball players, New York made it a felony to bribe amateur athletes. New York also passed several laws removing paroled felons from the provisions of law applicable to felons with reference to voting and various civil and professional privileges. New York also passed a law desired by Christian Scientists relieving Christian Science parents from criminal liability for failure to furnish medical attendance to their sick offspring, "provided that the laws relating to communicable diseases and sanitary measures are not violated."

North Carolina limited the power of police and sheriffs to take finger prints, eliminating a provision requiring fingerprints when the officer deems it advisable.

Maryland established short forms of indictment for certain crimes. Illinois passed a controversial bill defining radio misstatements made knowingly and maliciously, but radio stations are protected if they have no advance knowledge or opportunity to prevent the libel, and political addresses are exempt.

Massachusetts provided that criminal defendants even in capital cases may on death or incapacity of a juror waive right to trial by a jury of twelve. In any civil or criminal case, including capital cases, if the trial "is likely to be protracted" the court may impanel not more than two extra jurors as stand-ins.

Dams and Flood Control.—Vermont passed several laws on this subject aimed at holding up federal control projects to which the state has not given permission. Indiana created a flood control and water resources commission.

Dogs.—Arkansas requires dog vaccination.

Health and Welfare.—North Carolina provided for the arrest and imprisonment of active tuberculosis patients who do not follow health instructions. Vermont set up a blood plasma bank with a board of control. Maryland added a bureau to administer a program of medical and nursing care for poor persons, and permitted doctors to show their specialties on their signs, and to mail to patients notices of times for periodic examinations. Maine and North Carolina regulated nursing homes.

The most intense health insurance controversy of the year was in California where the governor sought to obtain a system of compulsory health insurance financed by contributions from employers and employees. The legislature held it up. The same thing happened in Rhode Island. Laws to the same effect introduced in New York were not pressed this year. The cash "sickness plan" now effective in Rhode Island, which compensates workers for loss of wages while sick, but does not provide for medical and hospital care, was proposed but not enacted in Colorado, Connecticut, Massachusetts, Minnesota, New Jersey, New Mexico, New York, Montana and Washington. The extension of "Blue Cross" hospitalization was however permitted in several states.

Highways.—The removal of state regulations impeding highway transportation was a feature of the legislative year 1945. Truck size and weight restrictions were liberalized in Arizona, Colorado, Iowa, Minnesota, North Carolina, North Dakota, Oregon, Pennsylvania, South Carolina, Tennessee, Texas, Wyoming and elsewhere. One such bill passed in Indiana was

vetoed. Throughout the eleven states west of the Dakotas, a trailer up to 60 feet long and weighing 68,000 gross pounds may now be operated. Maine and New Hampshire were added to the list of states permitting reciprocal truck registration. Pennsylvania repealed its prohibition of auto-carrying trucks, and Colorado did away with its boundary inspection statutes.

Parking meters were legalized in several states; for example, Indiana. That state also provided for reports of highway accidents and authorized municipal auto parks.

Holidays.—Several other states joined the group (now including all the states except Arkansas and Tennessee) which specify that Thanksgiving Day shall be the fourth Thursday in November instead of leaving it for the executives to choose the day. Kansas designated the fourth Saturday in September as American Indian Day, and repealed the law prohibiting various kinds of entertainment on Memorial Day. Wisconsin declared that "On Good Friday the period from 11 A.M. to 3 P.M. shall uniformly be observed for the purpose of worship."

Juvenile Delinquency.—New York took a distinct forward step in passing a series of laws to prevent juvenile delinquency and improve the treatment of youthful offenders. A state youth commission was created. Juvenile court measures were considered in Florida, Maryland, New York, Oklahoma, Texas, Wyoming and other states.

Labor.—Mississippi may lose its status as the only state without a workmen's compensation law if it adopts a bill which will be submitted by a legislative committee appointed in 1944. An apprenticeship council was set up in Vermont.

Up to August second injury funds had been provided in 32 states, the District of Columbia, Hawaii and under the U.S. Longshoremen's Act. Thirteen of these states set up such funds in 1945; namely, Arizona, California, Colorado, Connecticut, Delaware, Iowa, Kansas, Maryland, Oregon, Pennsylvania, Washington, and Wyoming. A model law was submitted by the International Association of IAB&C's in September 1944, which has been substantially followed in several of the 1945 acts. In five states,—Minnesota, New Jersey, New York, North Carolina and Oklahoma, amendments to existing second injury funds were enacted in the 1945 sessions.

Colorado, Florida and Maine were added to the states having occupational disease statutes. New York revised and systematized the whole setup for the administrative enforcement of the workmen's compensation law.

Added to the states which have tried to outlaw the closed shop was South Dakota. The legislation also placed the proposition before the voters as a constitutional amendment to be voted on in 1946. Similar bills were proposed in other states, but defeated in Arizona, Colorado, Georgia, Kansas, Maryland, New Hampshire, Tennessee and Texas. The Arkansas legislature refused to implement the anti-closed shop amendment adopted in 1944. Other bills limiting labor union activities were defeated in Arkansas, California, Colorado, Delaware, Massachusetts, and Vermont, and a bill which would have granted power to employees to sue strikers for losses sustained in jurisdictional strikes was vetoed by the governor of Minnesota.

Landlord and Tenant.—Massachusetts invalidated as "against public policy" provisions in leases whereby the tenant covenants to free the landlord from liability due to the landlord's own fault with respect to premises not within the

exclusive control of the tenant. New York entered a new field of government regulation by a law effective at least until July 1, 1946, establishing commercial rent ceilings in New York City and freezing occupancies subject to such ceilings.

Liquor.—Higher liquor taxes were enacted in several states; for example, Indiana, Oklahoma and Utah. Prohibition failed of adoption in any state. Arkansas, Georgia, North Carolina, and South Carolina were among the states where prohibition laws were defeated. West Virginia, however, lowered the legal alcoholic content of beer. A referendum on whether liquor may be sold by the drink was defeated in Utah, and Idaho; South Dakota, and Washington killed similar bills. North Dakota refused to outlaw the sale of liquor in roadhouses, and South Dakota in cafes. Idaho refused to separate beer and dancing. Local option moves failed in Indiana, South Dakota and other states. Wets and drys joined hands in Michigan and Minnesota to strengthen enforcement of liquor laws; Delaware and Oregon passed similar laws. The governor of Arkansas vetoed a bill removing limitations on the number of beverage licenses in wet counties. Connecticut set up a state board to administer a fund for the rehabilitation of inebriates. Alabama and New Jersey created fact finding commissions.

Marriage, Divorce and Adoption.—Pressure for the liberalizing of divorce laws, probably as a result of the thousands of hasty war marriages and of the Supreme Court decision in the Williams case, was evident in many legislatures. Delaware passed a bill allowing recognition by its courts of divorces and annulments granted elsewhere, except where the decree was for a cause occurring in Delaware, or for a cause which is not a ground for divorce in Delaware.

Idaho added five years separation as a ground for divorce. Additional grounds for divorce in New York were defeated. South Carolina refused to permit divorces. Arkansas defeated a bill to substitute one year for 90-day residence, and Montana rejected a 30 days' residence law. The governor of Colorado vetoed two laws aimed at preventing court review of divorces granted in other states.

Vermont provided that money payments in divorce decrees "shall have the force and effect of a judgment order." North Carolina specified that a divorce is to revoke that part of a will bequeathing property to the then spouse.

As to marriage, Arkansas enacted a three-days' notice of intention to wed, and similar waiting periods were the subject of bills in other states which do not already have the provision. Oklahoma passed the premarital physical examination bill which more than half the states now have. An attempt to repeal it in Idaho was rejected. Bills to outlaw common law marriages were offered in several states where such marriages, recognized by law, are being used in order to evade blood tests. Several bills to legalize proxy marriages and service men's marriages were also under consideration. Colorado prohibited marriage of persons under 16 except on court approval.

As to children, several states stiffened the requirements for notice to a natural parent of an adoption proceedings. Maine made adequate the consent of an agency having custody of a child, and permitted adoption regardless of age and without consent of parents if the adoptee is over 21. Wisconsin made adopted children heirs to property as "lineal heirs," and defined the burden

of proof where the legitimacy of a child of a married woman is in question. Vermont revised its whole adoption statute.

Names.—Arizona forbade the change of names and descriptions of natural or artificial objects, places or things, by state officers, departments, agencies or employees, stating that it is the public policy of the state to continue existing names so as to protect and preserve the historical record of the state. Nebraska changed the designation of the state from Tree Planters State to Corn Huskers State.

Postwar Security.—An unusual bit of legislation was a resolution passed by the New Hampshire legislature which authorized the governor to request the selectmen of towns to arrange for expressions of opinion at the annual March town meetings regarding the United States membership in a world security organization. The overwhelming vote in favor of such an organization by the hard-headed voters at town meetings in this supposedly isolationist state was an eye opener.

Probate.—Some changes in probate law and procedure were these: New Mexico provided that joint administration may be granted where an estate has descended without administration from a decedent to a now deceased heir. Delaware permitted persons over 18 to make wills. Arkansas tinkered in several acts with its law regarding the granting of administration to non-residents, finally permitting letters to issue to nonresidents named in wills. North Carolina gave the widow one half instead of one third of the personal estate where there is only one child, and the same share as a child if there are two or more children.

Public Records.—Recording by photostats and photographic machines was permitted in several additional states; for example, Arizona, Kansas, and North Carolina.

Race Discrimination.—New York's law against race discrimination breaks new ground and gives New York primacy in the enactment of a program against racial and religious discrimination. On the basis of the report of a commission authorized in 1944, statutes were passed creating a state commission against discrimination, of five members appointed by the governor. The law declares that:

"The opportunity to obtain employment without discrimination because of race, creed, color or national origin is hereby recognized as and declared to be a civil right."

The commission may obtain a civil order of enforcement from the civil courts subject to judicial review. The state commission is to formulate policies and make further recommendations to the legislature. Excepted from the law are domestic service, employers with fewer than six employees, and various clubs and institutions.

In connection with this legislation various laws relating to discrimination because of race, creed or color were amended so as to prohibit discrimination because of national origin.

Maryland refused to repeal its Jim Crow law, but legislation similar to the New York law was offered in several other states, and adopted in New Jersey. The New Jersey measure sets up a division in the state department of education to enforce antidiscrimination in employment, and at the same time New Jersey enacted a series of bills broadening the state's existing antidiscrimination laws to include race, creed and ancestry.

Bills to ban discrimination in public accommodations or to strengthen discrimination laws already on the books were defeated in Utah,

Oregon, Rhode Island and Kansas, although in Utah an interim statute of racial discrimination was provided for.

Service Personnel and Veterans.—Many states adopted laws regarding acknowledgments of documents, making of powers of attorney, and drawing of wills by men in the service, and proof of death and of wills of service men. Laws regarding conservators for persons in the service and uniform veterans' guardianship acts were also adopted, and acts permitting commissioned officers to administer oaths of office to service personnel. Several states excused service men from taxes, tax penalties, payment of license fees and other exactions. At least ten states granted some form of income tax exemption. Three gave property tax exemptions, and three enlarged the inheritance tax exemption on the estate of a service man dying in service. Many states created commissions to look after the welfare of veterans.

Slot Machines.—Idaho allowed nonprofit fraternal and similar organizations to operate slot machines upon paying a fee.

State Colors.—North Carolina designated red and blue as the state's colors.

Taxation.—The significant feature of the tax legislation of the year is the definite tendency against adding or increasing state taxes. During the war, bonded indebtedness has been reduced and surplus funds have been accumulated, but a use tax on property bought outside of Arkansas was vetoed by its governor, while Oklahoma passed a similar law.

The decision of the Supreme Court in 1944 defining insurance as interstate commerce was responsible for a revision of the tax systems of many states with reference to insurance companies. Rates were equalized on domestic and foreign companies so as to avoid the danger that the tax levy for the year on all insurance companies might be invalidated. Up to July 1, 20 states had passed such acts with other states to follow later. In some of these states the existing rates applying partially were extended to apply to all companies. Other states repealed discriminatory provisions and some took advantage of the opportunity to revise (upwards) existing schedules. Along with these measures went legislation in many states freeing the directors of domestic companies from personal liability for the payment of taxes imposed and paid in other states under laws which might subsequently be declared unconstitutional.

Time.—Arizona adopted standard Mountain time except as to matters governed by federal law.

Uniform and Model Laws.—Until the legislative record of the year is complete it is impossible to collate the list of uniform and model laws adopted, but it can be noted at this time that the uniform narcotics act as amended was adopted in several states. New York passed with changes the model deposit in trust law; the model deposit in two names law; and the model adverse claim to deposit law. New Jersey passed the uniform common trust fund law.

(9) Race Problems.—This heading comprises this year an extensive category. The problem of the Nisei reached the Supreme Court for decision at the sitting Dec. 18, 1944, just before the new year. In *Korematsu v. U.S.* 89 L. ed. Adv. Op. 202, 65 S. C. Rep. 193, 13 L. W. 4062, the court said that legal restrictions curtailing the civil rights of a single racial group must be subject to rigid scrutiny, but it is within the war power to

exclude citizens of Japanese ancestry from a west coast area threatened by Japanese attack, and to transfer them to and detain them in camps and centers. The conviction of an American citizen of Japanese descent for remaining in a military area contrary to an executive order, was affirmed where it did not appear whether or not he was loyal, no question being raised on that point. The court conceded the hardship of the decision, but said that "hardships are part of war, and war is an aggregation of hardships." The court also approved the order notwithstanding that it did not discriminate between loyal and disloyal citizens, and again said that the war power is "the power to wage war successfully." Three judges dissented, three took no part in the decision, and one of the concurring judges concurred only in part. The decision was therefore rendered by a minority of the whole court.

But on the same day in *Ex parte Mitsuye Endo*, 89 L. ed. Adv. Op. 219, 65 S. C. Rep. 208, 13 L. W. 4054, the court limited the Korematsu decision. In this case an American citizen of Japanese descent but of proved loyalty was released on habeas corpus. She had been removed to a war center and there detained against her will after her loyalty had been established and leave clearance granted.

The civil rights of the Negro were again before the court in *Akins v. Texas*, 89 L. ed. Adv. Op. 16, 65 S. C. Rep. 1276, 13 L. W. 4467 (June 4). The conviction of a Negro in Texas was affirmed, notwithstanding the fact there was an arbitrary and purposed limitation by the jury commissioners of the number of Negroes to be placed on the grand jury panel. Of the grand jurors only one was a Negro. The Supreme Court was not prepared to say that the judgment of the jury commissioners to the effect that one Negro on a grand jury was enough, should be disapproved in the absence of any evidence that there was a deliberate intention on their part to discriminate against the colored race. The court says: "Fairness in selection has never been held to require proportional representation of races upon a jury." Less than 16 per cent of the population of this particular county were Negroes. Three judges dissented. The courts of the Southern states wrestled throughout the year with this problem of Negroes on jury lists, and several decisions were rendered which tried to reconcile the various federal Supreme Court decisions with local practices.

In two cases under the Railway Labor Act the court, Dec. 8, 1944, enforced the duty of the bargaining agent of a union to represent a colored minority of employees. *Steele v. Louisville, etc. R. Co.*, 89 L. ed. Adv. Op. 172, 65 S. C. Rep. 226, 13 L. W. 4075; *Tunstall v. Brotherhood*, 89 L. ed. Adv. Op. 181, 65 S. C. Rep. 235, 13 L. W. 4079.

Steele was a Negro fireman suing for himself and other Negro firemen. The brotherhood, which was the bargaining agency, excluded Negroes from membership. The brotherhood without consulting the Negro fireman, negotiated with the railroads for an agreement which would limit and ultimately exclude Negro firemen. The court said that the Railway Labor Act did not confer upon a union the power to sacrifice for the benefit of its members, rights of a minority of the employees who were excluded from joining the union.

In *Railway Mail Association v. Corsi*, 89 L. ed. Adv. Op. 1435, 65 S. C. Rep. 1483, 13 L. W.

4576, the Railway Mail Association questioned several sections of the New York Civil Rights law which prohibited labor organizations from denying membership by reason of race, color or creed. The association's constitution limited its membership to Caucasians and Indians. The association claimed that it was not a labor organization, and that the sections if applied would violate the 14th Amendment and conflict with the federal power over post offices and post roads. The New York Court of Appeals rejected these contentions, and on appeal the Supreme Court of the United States on June 18 affirmed the decision.

In *Morris v. Williams*, 149 Fed. 2d 703 (CCA No. 8, June 19), the court held that school authorities had discriminated against Negro school teachers by favoring white teachers with reference to wage scales. The court quoted with approval a statement by the late Justice Harlan that the constitution is "color blind," and said that the evidence does not sustain the claim that substantially all Negroes are less capable than whites. The injunction was, however, refused, because the matter had been settled amicably while the suit was pending.

The 4th CCA on April 17 obliged a privately managed Maryland free public library substantially supported by the city to allow Negroes admission to its training classes. This was under the 14th Amendment. *Kerr v. Enoch Pratt Free Library*, 149 Fed. 2d 212.

In two cases the CCA of the District of Columbia considered restrictive covenants against Negro use and ownership of real property. In one case the court refused to enforce the covenant because the character of the neighborhood had changed. In the other case the covenant was enforced somewhat unwillingly by three judges, one dissenting and one concurring on the ground of precedent only. *Mays v. Burgess; Gospel, etc., Association v. Bennett's*, 147 Fed. 2d 869, 878 (January 29). In the Mays case it appeared that there had been Negro penetration adjoining the property on one side, but in the other direction there was an unbroken white community, and therefore the injunction was granted. In the Gospel case a sale to a Negro was held unobjectionable, provided the Negro did not thereafter lease it to another Negro, where there was indication of Negro penetration into the neighborhood.

California had some interesting Negro decisions. In *James v. Marinslip Corporation*, 155 Pac. 2d 329, (Supreme Court, December 1944) a labor union enjoying a monopoly, was not allowed to have court enforcement of a closed shop agreement because it excluded Negroes from membership. The court said that the fact of the monopoly gave a public interest, and under such circumstances a labor union cannot adopt the membership standards of a golf club. The auxiliary membership offered by the union was disapproved as discriminatory.

The Bautiste case mentioned under *Labor* above shows the same point of view.

In *Blakeney v. Clark, etc. Corp.*, 13 L. W. 2676 (California Supreme Court, June 4, 1945) the court held that a closed shop union must open its membership to Negroes or forfeit its closed shop privileges; and this is so, whether or not it holds a monopoly of labor in the locality. In *People v. Zammora* (152 Pac. 2d 180, October 1944) the district court had reversed the conviction of twelve Mexicans, which had been caused by race prejudice, but in *Ter-*

rell v. Wells, Swimming Pool v. Rodriques, 182 Pac. 2d 825 (March 1945) refused to order Mexicans admitted to a swimming pool.

The Mississippi Supreme Court in *Griffin v. Gulf, etc. R. Co.*, 21 So. 2d 814 (April 23) allowed Negro firemen to preserve seniority rights notwithstanding a decision cutting out their rights made in a dispute between a union and the employer. The court said that a railroad union has the duty of representing impartially all members of its class, hence the court rejected the union's defense that a labor board award had determined the rights of Negro firemen, who are not eligible for union membership, and whose cause was ignored before the board. The court says that the union was trying to plead its own wrong, and that the employer was party to the wrong because it did not advise the board of the firemen's rights.

Administrative Decisions.—The NLRB on June 28 ruled that a union's segregation of Negro and white employes into separate locals is not per se racial discrimination, so as to justify withholding a certificate of the union as the exclusive bargaining unit.

On June 30 the CIO vainly attempted to upset a bargain made by an AFL union which had obtained bargaining rights through a joint committee composed of representatives of the union and of its special affiliate for Negroes.

A railroad's failure to furnish Pullman and dining car service to Negroes on an interstate journey was approved by the ICC on May 8, 1945.

The Fair Employment Practice Committee (FEPC) on Dec. 23, 1944 ordered a munition manufacturer to abolish racial quotas, and to cease from laying off Negroes through a seniority plan not equally applicable to whites; and on February 12 forbade the Kaiser Company to cast off Negro employes on the ground that a closed shop union in this ship building company refused to clear the Negroes in the effort to make the Negroes set up an auxiliary lodge.

The FEPC also castigated a seamen's union for discrimination against Negroes. The union said "We do not mix," and tried to set up a system whereby Negroes would be limited to being stewards in ships with all Negro stewards. The commission avoided saying whether segregation of itself was a violation of executive orders, but disapproved in this case as being merely an excuse for obstructing access of Negroes to a vital occupation.

(10) Taxation.—The reports and legal magazines were replete with tax decisions, though, of course, most of these cover questions of detail important in the interpretation of a particular tax statute, but of little permanent interest because the statutes are so readily and frequently changed. There were, however, some decisions of real importance.

The Supreme Court of the United States in *Ford Motor Co. v. Indiana*, 89 L. ed. Adv. Op. 372, 65 S. C. Rep. 347, 13 L. W. 4115, on January 8, dismissed a taxpayers' suit against a state department because the state had not consented to the suit. The attorney general of the state could not waive this requirement where the state statutes make it plain that state procedure for obtaining refund is in effect a procedure against the state, although nominally against officials.

The federal government does not have to recognize an Oklahoma statute setting up an elective community property arrangement be-

tween husband and wife. *Commissioner v. Harmon*, 89 L. ed. Adv. Op. 71, 65 S. C. Rep. 103, 13 L. W. 4016 (Nov. 20, 1944). The court interpreted the Oklahoma statute as merely affecting an assignment of income; not imposing the Spanish law community property system, but merely permitting contracts between husband and wife as to how their property should be held. Two judges dissented. They objected to permitting the community property system to become the vested interest of only a few states.

On the same day in *McDonald v. Commissioner*, 89 L. ed. Adv. Op. 78, 65 S. C. Rep. 96, 13 L. W. 4013, the court held that amounts contributed for campaign expenses by a judge seeking re-election are not deductible under the income tax law. The expenditure was "the price paid for an active share in the hazards of popular elections," and the expense was not incurred in "carrying on" the "business" of judging. Four judges dissented saying that the expense was incurred in connection with the production and collection of income.

A different method of state assessment of property within a certain classification is not a denial of equal protection under the 14th Amendment. This was held on February 26, *Charleston, etc. Association v. Alderson*, 89 L. ed. Adv. Op. 621, 65 S. C. Rep. 624, 13 L. W. 4230.

The intangible property of the complaining taxpayers was assessed at 100 per cent while other intangible property was assessed to other taxpayers at a lower rate. The court said that the complaining taxpayer could not make out a case under the 14th Amendment unless he proved that his property is actually worth less than the assessed value; and if one taxpayer claims that another owns under-assessed property, he must prove that such property is worth more than its assessed value. The decision seems to allow different rates of assessment on the same class of property under the general property tax within a certain class of taxpayers, provided the difference is based on a substantial reason. Only one judge dissented.

The problem of state taxes under federal housing projects (*AMERICANA ANNUAL* 1945, p. 424) was settled on January 2 by the Supreme Court in *City of Cleveland v. U.S.*, 89 L. ed. Adv. Op. 270, 65 S. C. Rep. 280, 13 L. W. 4090. The court upheld the exemption on the ground that the Federal Housing Act sets up a policy to promote the general welfare of the nation by using its funds and credit to help local units by improving housing conditions. The clause in the act exempting the property of the housing authority from taxation is valid. Congress may exempt property of the United States or any of its agencies from state taxation in carrying out the purposes of federal legislation. An injunction against state tax officials was allowed on the ground that they were enforcing state laws "embodying a statewide concern and in the state's interest."

The California Supreme Court denied constitutionality to a provision in the California sales tax law whereby a tax was levied on oil sold by a company in California to a foreign country and delivered to a ship of that country in a California port. This clause amounted to the levying of taxes on exports. *Richfield Oil Corp. v. State Board*, 155 Pac. 2d 1 (Dec. 30, 1944). (Rehearing granted, January 29.)

Notwithstanding the Clifford case which

taxed trust income to the grantor in so far as he retains a personal benefit for himself or his dependents, the CCA in the 10th Circuit ruled in *Hall v. Commer*, 150 Fed. 2d 304 (July 2) that the retaining by a grantor trustee of an irrevocable trust of a discretion to distribute, withhold, change shares, invade the principal, etc., is not the retaining of a taxable personal interest in the trust. The mere power to "deal with it as if it were his own" does not mean he can use it for himself. He is merely safeguarding investments which his own acumen accumulated.

The expectation that state taxes with different rates on resident and nonresident insurance companies would be invalidated as a result of the decision last year by the Supreme Court in the Southeastern Underwriter's case (*AMERICAN ANNUAL* 1945, p. 411) was confirmed by court decisions in several states; for example, Indiana,—with at least one lower court (in Michigan) ruling to the contrary. Statutes solved the problem in many states by equalizing the taxation (see *State Legislation* above).

The Supreme Court of Connecticut subjected to the state's inheritance tax the proceeds of a \$40,000 life insurance policy issued to a person 83 years of age for a single premium payment of over \$37,000, in connection with an annuity contract, with one judge dissenting. The court decided that the policy was "not one of true life insurance." Literally, it is life insurance, but practically the actual situation was that the insured person made a payment of \$44,000 in consideration of a promise to pay her an annuity of \$83 per month and to pay \$40,000 to her beneficiaries. There was no substantial risk assumed by the insurance company. *Day v. Wals*, 42 Atl., 2d 366 (April 3).

Both Nebraska's and North Dakota's oleomargarine taxes were held unconstitutional as an unreasonable classification of property for taxation. "There is no difference between imported cottonseed oil and domestic cottonseed oil," said the Nebraska Supreme Court in May, in *Thorin v. Burke*, 18 N. W. 2d 664. The Nebraska statute taxed at a higher rate, margarine made from imported fats and oils. The district court in North Dakota took a similar stand in September, saying that the law was not a bona fide revenue measure but an economic regulation discriminating in favor of the dairy interests.

Property forming a part of a city owned and operated transit system is taxable, although the constitution exempts "public property used exclusively for any public purpose." This particular property is being used by the city in its proprietary capacity. *Zangerle v. Cleveland*, 61 N. E. 2d 720 (June 6).

Embezzled funds do not constitute a part of the embezzler's taxable gross income. *Wilcox v. Commissioner*, 148 Fed. 2d 933 (CCA No. 9, March 30).

The prize annually awarded by the American Bar Association for a legal essay is a gift exempt from taxation. *McDermott v. Commissioner*, 150 Fed. 2d 585 (CCA D.C., June 18).

Traveling expenses "while away on business from one's home" means traveling expenses from the place where one in fact resides. *Flowers v. Commissioner*, 148 Fed. 2d 163 (CCA No. 5, March 23). Here the taxpayer had home, law office, church, club affiliations and voting residence, in the city where he was born. He was also general counsel of a railroad company which had its principal office elsewhere.

The reality of a nonprofit organization operating a hospital service plan is taxable because the organization is really engaged in insurance and not merely in securing paying patients for the hospitals. *Hospital Service Association v. Evatt*, 57 N. E. 2d 928 (Oh. Supr. Ct., Nov. 22, 1944).

(11) *The War*.—The only war decisions of permanent interest have already been cited under various heads above. A few other cases should be mentioned for historical interest.

On January 2 in *Singer v. U.S.*, 89 L. ed. Adv. Op. 262, 65 S. C. Rep. 282, 13 L. W. 4086, the court interpreted Section 11 of the Selective Service Act to include all conspiracies to violate the act whether or not force or violence might be involved. Convictions for conspiracy to aid one of the conspirators to evade service were affirmed. The only question before the court was whether the conspiracy was criminal if no overt act had taken place. The majority opinion concedes that "the matter is not free from doubt" and four judges dissented. One gets the impression that the majority of the court may have made some poor law in the effort to back up the then existing law, and that the decision might have been different had the case arisen after the close of hostilities.

Some months later on June 11 the court in *Kegan v. U.S.*, 89 L. ed. Adv. Op. 1314, 65 S. C. Rep. 1203, 13 L. W. 4534, remanded the conspiracy case against the Bund on a technical ground as has already been noted above under *Constitutional Law*.

The district court in Eastern Pennsylvania on July 26, 61 Fed. Sup. 570 in *Pfeiffer v. Garvey*, interpreted the Soldiers' and Sailors' Civil Relief Act as not protecting a service man and his wife who were merely guests in premises leased by the sailor's aunt. The court says that the persons entitled to be protected in their occupancy of premises must have "at least an obligation to pay rent."

The same act was interpreted in *U.S. v. Alberts*, 59 Fed. Sup. 298 (DC Wash., March 13) to extend the period of redemption on real property beyond the period fixed by a state statute. The court said that Congress had the war power to extend these time limits in order to protect men in the service from the fear of loss of their property.

A circuit court in Kansas refused to eject a soldier's wife in a proceeding naming her as the tenant.

The federal district court in Western New York on February 17 in *U.S. v. Williams*, 59 Fed. Sup. 300, held that a Wac is a soldier in the military service with respect to a federal statute against concealing and harboring deserters. The court said that Wacs are in potential combat service just as much as any male soldier and are component members of the army.

A legal development of the year which laid the foundation for far-reaching developments was the agreement between the four Allied powers participating in the European war with reference to the international military tribunal for trying of the major war criminals of the European Axis. The tribunal is composed of one member and an alternate from each of the four signatories.

All four signatories must be represented at any session of the tribunal; decisions ordinarily are to be made by a majority vote. Crimes are defined in three categories: (1) crimes against peace,—wars of aggression in violation of trea-

ties; (2) war crimes,—violations of the laws or customs of war, such as murder, slavery, killing of hostages, wanton destruction; (3) crimes against humanity,—for example, murder of civilian populations, prosecutions.

The official position of accused persons in high positions is not to free them from responsibility or mitigate their punishment, but acting under orders may be considered in mitigating the punishment of subordinates.

The tribunal has the power, after notice and hearing, to determine that any group or organization was a criminal organization. In that case membership in the organization is ground for conviction by other courts of the signatories; and these courts may also try and punish for crimes other than membership in a criminal organization, persons convicted by the tribunal.

The tribunal is to draw up its own rules. The agreement makes, however, certain specifications "in order to insure fair trial," for example, form, language and copies of indictment and documents relied upon; right of the defendant to offer a defense and make an examination; language of the trial; right to counsel; right to present evidence and cross-examine witnesses.

Each signatory is to appoint a chief prosecutor and these act together as a committee to arrange for procedure and assignments. The duties of the prosecutors are specified.

The tribunal is vested with powers to summon witnesses, interrogate defendants, require the production of documents, administer oaths and appoint subordinate officers.

Trials are to be confined strictly to an expeditious hearing of the issues; strict measures are to be taken to prevent delay and rule out irrelevancies; and power to deal with contumacy is granted. The tribunal is not to be bound by technical rules of evidence, but is to have full right to rule upon relevance. The tribunal is to take judicial knowledge of facts commonly known, and of official documents and reports of the United Nations. The order of procedure for trials is carefully set forth. All documents and proceedings are to be furnished and conducted in English, French, Russian and the language of the defendant, and translations into other languages are to be made where necessary. The permanent seat of the tribunal is to be at Berlin. The first trial was held at Nürnberg, and subsequent trials are to be at such places as the tribunal may decide.

The judgment as to guilt or innocence is to give the reasons, and is to be final, not subject to review. The tribunal may impose death or such other punishment as it deems just, and may deprive the convicted person of stolen property. The Control Council for Germany may reduce sentences or extend leniency, and is to report to the committee of prosecutors additional evidence discovered against convicted criminals. Expenses of the tribunal and of the trials are to be charged against funds allotted for maintenance of the Control Council. See also WAR CRIMES TRIALS.

(12) **World Court.**—A World Court was included in the agreement among the United Nations meeting at San Francisco in furtherance of the Dumbarton Oaks agreement. During the months between Dumbarton Oaks and San Francisco the attention of public-spirited lawyers throughout the world was focused on the subject. In the United States and Canada the American Bar Association in co-operation with

the Canadian Bar Association held a series of 25 conferences of lawyers throughout the two nations, and in addition eight public meetings were held.

The consensus of lawyers' opinion thus obtained was collated and put into the form of a statement approved by both bar associations, translated into French, Russian and Spanish, and submitted to the San Francisco Conference (April 25-June 26). The opinion of the lawyers was that the International Court of Justice should form an integral part of the United Nations Organization; should be the continued Permanent Court of International Justice with adaptations necessary because of the interlocking of the League of Nations with the new organization; that every effort should be made to extend the compulsory jurisdiction of the court; and that the scope of international law should be broadened and its authority strengthened.

The statute of the International Court of Justice, which is included in the Charter of the United Nations, varies from the recommendation of the two bar associations in setting up a new court instead of continuing the Hague Tribunal which has long been in existence, and does not enlarge the jurisdiction of the court, as the lawyers hoped it would, but otherwise substantially follows the recommendations of the bar. All members of the United Nations organization are automatically to be parties to the new statute. States not members of the United Nations may be admitted later as parties to the new statute on conditions not yet prescribed. The new court will start with at least 50 parties. The present statute has 48 adherents.

The court is to be composed of a body of 15 independent judges, no two of whom may come from the same state. After the system is established, their terms of office are nine years with re-election permitted, staggered so that the terms of five judges expire at the end of every three years. The judges are not to exercise political or administrative functions or engage in other professional occupations, and, of course, are not to appear as counsel in any case or participate in the decision of any case in which they have previously taken part. They enjoy diplomatic privileges and amenities, and, of course, are duly sworn. Any judge may be excused from participating in a particular case for cause.

The members are to be elected by the General Assembly and Security Council from a list of persons nominated by the national groups in the long-established Permanent Court of Arbitration. Acting as a nominating committee for judges of The Hague Tribunal has long been substantially the only remaining function of these national groups. Those nations not represented in the Permanent Court of Arbitration are to set up special nominating groups as has been the case in the past.

The procedure for nominating and electing members, and filling vacancies and dismissing members, of the court is carefully detailed in the statute. The conditions under which a state as a member of the United Nations may participate in the election of members of the court may be laid down by the General Assembly of the United Nations upon recommendation of the Security Council. The court allocates its officers and may appoint subordinates. The seat of the court is at The Hague, but it may exercise its functions elsewhere. The president and

register must reside at The Hague. The court is to remain in session substantially all the time, but members of the court are entitled to periodic leave. The full court is to sit except where otherwise expressly provided, a quorum being nine judges. The court may, however, from time to time form "chambers" of three or more judges for dealing with particular categories of cases such as labor cases and transit companies, or with particular cases. The judgment of these chambers shall be considered as rendered by the court. These chambers may sit elsewhere than at The Hague. A special chamber of five judges is to have the power to determine certain cases by summary procedure.

Judges of the nationality of each of the parties retain their right to sit in the case, but in such case any other party may choose a judge for the cause, preferably from among the eligible list of persons nominated for judge. If the court includes no judge of the nationality of the parties, all parties may choose a judge as above stated. Such judges *ad hoc* shall take part in the decision on terms of complete equality with their colleagues.

The statute provides for salaries and allowances, free from all taxation, to be paid by the United Nations in such manner as shall be decided by the General Assembly.

The jurisdiction of the court remains substantially as in the present statute. The optional conferring of obligatory jurisdiction is retained despite the desire of a large majority of the states for broadening jurisdiction. The statute goes to the limits of language to retain for the new court all the jurisdiction conferred on the existing court by treaties, agreements and declarations. The powers and functions of the court as to advisory opinions are retained. These opinions may be requested by assembly, security council, and to a limited extent, by other bodies and agencies.

Charter provisions as to the court cannot be amended so as to abolish or impair it over the objection of any one of the Big Five. The provision as to amendment fill a hiatus in the existing system. A special chapter in the statute provides that the procedure laid down for amending the charter shall be followed for amending the statute subject to the possibility that nonmember states which are parties to the statute may be permitted to participate. The court itself may propose amendments.

As to the competence of the court, only states may be parties to cases. The court may request and receive from public international organizations relevant information. Whenever the construction of the charter of such an organization or of an international convention is in question the organization concerned shall be notified. When a state which is not a member of the United Nations is party to a case, the court shall fix the amount which that party is to contribute towards expenses unless such state is already bearing a share of the expenses of the court.

Article 36 specifies that the jurisdiction comprises all cases referred to it by the parties and all matters provided for in existing charters, treaties, and conventions. Parties to the statute may recognize as compulsory in relation to any other state accepting the same obligation, the jurisdiction of the court in all legal disputes concerning treaty interpretation, questions of international law, the existence of facts which would constitute a breach of international ob-

ligation, and reparations for breaches thereof. Such declarations may be made unconditionally or on reciprocal conditions. Such declarations as have already been made under the previous statute and which are still in force shall be deemed acceptances of compulsory jurisdiction in accordance with their terms. The court itself shall determine whether it has jurisdiction in the event of dispute.

The court shall decide in accordance with international law disputes submitted to it, and apply international conventions, international custom, the general principles of law recognized by civilized nations; and (as subsidiary) judicial decisions and teachings of publicists. The court may nevertheless decide a case according to substantial justice if the parties agree thereto.

As to procedure, the official languages shall be French and English, either language to be used in accordance with the agreement of the parties. In the absence of agreement each party may use the language preferred, and the court shall decide in both languages. The court may authorize a language other than French or English.

Detailed provisions are made regarding procedure and orders, including default proceedings.

The court is to make all decisions in private, deciding by majority of the judges present with the presiding judge having a casting vote. Judgments shall state the reasons on which they are based, and contain the names of the judges who have taken part in the decision. Dissenting and separate opinions are permitted. The decision of the court has no binding force except between the parties and in respect to that case, but is final and without appeal. Judgments may, however, be revised by the court for cause within ten years. Intervention by other interested states may be permitted, and other states shall be notified when the construction of a convention in which they are interested is concerned.

The existing court of international justice will continue to exist, but will gradually fade out. No elections have been held since 1939, and the terms of the eleven judges now in office have expired. Presumably the states which are parties to the former court will move to liquidate it, and there is not likely to be any occasion for reactivating it before its demise.

Immediately on the adoption by the United States of the San Francisco document, Senator Morse of Oregon offered a resolution in the Senate recommending that the president make a declaration accepting the compulsory jurisdiction of the court over legal disputes. Adopting this resolution would complete the turnabout of this nation from the isolationist position which was taken when Woodrow Wilson's recommendations at the end of the First World War were discarded by the Senate.

Courts and law are going to mean, even to American lawyers, more than merely domestic problems. The World Court and world law are bound to be subheadings in future articles on law in *AMERICANA ANNUALS*.

CLEMENT F. ROBINSON,
Attorney-at-Law, Portland, Maine.

LEA, Luke, American politician, banker, and newspaper publisher: b. Nashville, Tenn., April 12, 1879; d. there, Nov. 18, 1945. A powerful political figure in Tennessee for more than two decades, Colonel Lea was the leader of a daring expedition that attempted to kidnap the exiled German kaiser from Holland in December 1918.

Colonel Lea was graduated from the University of the South in 1899, received his M.A. degree there the next year, and his LL.B. from Columbia University in 1903. He began practice of the law in Nashville in 1903; organized the Nashville *Tennessean* four years later; and was elected United States senator from Tennessee in 1911. During the First World War, he served as commanding officer of a field artillery regiment of the 30th Division. After the Armistice, a group of eight men from this division crossed the border from Germany into the Netherlands and made their way to Amerongen, at that time the haven of Wilhelm II. They negotiated for an interview, but their lack of credentials caused suspicion, and the exploit to seize Wilhelm and turn him over to an Allied military court proved unsuccessful. The incident caused Holland to complain that its neutrality had been violated, but despite an army investigation, none of Colonel Lea's group was punished. Colonel Lea later became an important newspaper publisher and an associate of Rogers Caldwell, investment bankers. In the fall of 1930, Caldwell and Company failed, bringing down several banks with it, and resulting ultimately in the appointment of receivers for the newspapers. The tying up of state funds totaling several millions in the closed banks led to an investigation and to the indictment of Colonel Lea and his son, Luke Lea, Jr., in North Carolina and Tennessee. The two were tried in North Carolina in 1931, and were convicted of defrauding the Central Bank and Trust Company, one of their interests, of more than \$1,300,000. Colonel Lea was paroled after he had served slightly less than two years of his 6- to 10-year sentence. Meanwhile, the Tennessee charges against the two had been dropped, and in 1937 the State of North Carolina issued a full pardon, restoring him to full civil status.

LEAD. The severe manpower shortage at the mines was the main reason for the continued reduction in the nation's output of lead in 1944, according to the United States Bureau of Mines. Imports of refined lead—a ready source of immediately usable material—were lower, consumption was maintained at a high level, and government stocks of refined lead were steadily reduced to a point considered below the margin of safety. At the end of 1944, a sweeping revision of existing General Preference Order M-38 was announced by the War Production Board to restrict further consumption and thereby help to ease a situation which had grown critical. The 1944 mine production of 416,861 short tons of recoverable lead (including that made into lead pigments) in the United States and Alaska was 8 per cent below the 453,313 tons produced in 1943. The total value of the lead produced in domestic mines in 1944, calculated on the basis of 8 cents a pound, amounted to \$66,697,760, against the 1943 production valued at \$67,996,950 calculated at 7½ cents a pound. The southeastern Missouri district continued to be the largest lead-producing area in the United States, supplying 41 per cent of the total output.

LEASE-LEND. See LEND-LEASE.

LEBANON. A republic extending for 120 miles along the eastern coast of the Mediterranean, bounded on the north and east by Syria, and on the south by Palestine. It has an area of slightly over 4,000 square miles, and a population (composed mainly of Christian and Moslem Arabs) estimated in 1945 at about 1,000,-

000. The capital is Beyrouth (Beirut), pop. 200,000. On Sept. 21, 1943, Bechara al-Khoury, a Maronite Christian, was elected president of the republic by the Chamber of Deputies, and he nominated to the premiership Riad Solh, a Moslem, who was later succeeded by Abdul-Hamid Karameh, another Moslem. The flag of Lebanon, adopted Dec. 2, 1943, consists of bands of red, white, and red, with the green cedar—symbol of the country from biblical times—in the center. At Beyrouth are a French university, with about 1,000 students, and an American university, with about 1,500. Silk production and wine making are the principal industries, but many textile projects have developed as a result of the Second World War. Agricultural crops include wheat, barley, corn, sorghum, and oats; other products of the soil are tobacco, cotton, sesame, olives, olive oil, and citrus fruits. Iron and coal mines are worked in Lebanon, and there are indications of petroleum. Beyrouth, the principal port for both Lebanon and Syria, is well served by railroads, motor highways, and air transport.

While the independent status of Lebanon (as of Syria) had been recognized in 1941 by Gen. Charles de Gaulle's French Committee and by Great Britain following the expulsion of pro-German agents and sympathizers, Lebanon remained, juridically, a mandate entrusted to France by the League of Nations. However, as a result of the country's insistence on its freedom and independence, Gen. Georges Catroux, on behalf of the French National Committee, transferred to Lebanon (as it did to Syria) all legislative and administrative functions, effective from January 1, 1944, and early in September of the same year both republics were accorded full recognition by the Soviet Union. A like step was taken by the United States in the same month (September 19), with President Roosevelt's appointment of George Wadsworth as United States minister to Lebanon and Syria. Lebanon has accredited ministers to Paris, London, Washington, and Cairo, and by the middle of 1945 had been recognized by a score of powers.

During January 1944 a Lebanese delegation participated in discussions at Alexandria by Arab leaders representing several countries, looking toward unification of policies. However, on Feb. 3, 1945, President Bechara al-Khoury made it clear in a press interview at Beyrouth, that Lebanon intended to retain full independence in preference to joining a greater Syria or any other larger entity of Arab peoples. In March 1945, Lebanon joined the Arab League (q.v.). On April 12 its representative signed the United Nations Declaration, and late in the same month Lebanon took part in the San Francisco Conference as a full-fledged independent and sovereign member of the United Nations. In May, a series of crises which had begun in November 1943 between the Levantine states (Lebanon and Syria) and France, culminated in armed clashes, involving British intervention in Syria (q.v.). On July 7 the French agreed to release Levantines in the French army in Lebanon and Syria, permitting them to be incorporated into the national armies of the Levantine republics. On July 15 an agreement was announced from Beyrouth under which subsidiaries of the Standard Oil companies of New York and of New Jersey are to construct and operate two oil refineries near Tripoli, terminal point of the northern branch of the internationally-operated pipe-line from Kirkuk, in Iraq, the southern branch of

which runs to Haifa, in northern Palestine. On August 21 it was reported that the Lebanese cabinet had resigned, and that Sami Solh, a Moslem (cousin of Riad Solh, who as premier in 1943 had urged complete independence for Lebanon), had been asked to form a new cabinet.

LEE, Willis Augustus, Jr., United States naval officer: b. Natlee, Ky., May 11, 1888; d. Casco Bay, Me., Aug. 25, 1945. Vice Admiral Lee's interception of a Japanese convoy en route to an all-out assault against embattled marines on Guadalcanal, Nov. 14-15, 1942, was one of the pivotal victories of the American Navy in the Pacific war. It was at a crucial moment in this struggle between superior Japanese forces and American task groups of relatively minor strength that he sent out the message: "Stand aside, I'm coming through," and his task force sank a Japanese battleship and three cruisers.

Known to his intimates as "Ching" Lee, Admiral Lee entered the navy in 1904 and was graduated from the Naval War College. He was commissioned captain in 1936 and rear admiral in 1942. Earlier in the war he had served as assistant chief of staff to the commander in chief of the United States Fleet. In February 1942 he was made commander of a task force in the Southwest Pacific. Together with Admiral Marc A. Mitscher, he directed the heavy attacks on Truk and other strong points in the Carolines in the spring of 1944, and in the fall of that year he was second in command to Admiral Halsey in the decisive blows handed the enemy by the Third Fleet in the Formosa and Ryukyu areas. For two months before his death, Admiral Lee had been on Atlantic duty on a special top-secret tactical assignment.

LEEWARD ISLANDS. A group in the West Indies, southeast of Puerto Rico, constituting a British colony. The aggregate area of the islands is 422 square miles, and the population is estimated (1944) to number 101,146. Administratively, the colony comprises four presidencies, as follows:

Presidency	Square miles	Population	Capital
Antigua ¹	170.5	42,789	St. John's (10,000)
St. Kitts-Nevis ²	152	38,305	Basseterre (8,000)
Montserrat	32.5	13,332	Plymouth (2,000)
British Virgin Islands.....	67	6,720	Road Town (700)
Total	422	101,146	

¹ The island of Antigua (108 square miles) and its dependencies, Barbuda (62 square miles) and Redonda (1 square mile).

² St. Kitts, or St. Christopher (68 square miles), Nevis (50 square miles) and dependent Anguilla (34 square miles).

A governor (Sir Leslie Brian Freeston appointed Oct. 5, 1943) is assisted by a federal Executive Council of 12 members (6 officials and 6 unofficials) and a general Legislative Council with a membership of 8 officials and 9 elected unofficials (Antigua and St. Kitts-Nevis with 3 each, Montserrat with 2, and the British Virgin Islands having 1). For purposes of local government, there are also executive and legislative councils (the latter partly elected) for each of the presidencies except the Virgin Islands, for which the governor is directly responsible. The Windward Islands (q.v.) and the Leeward Islands have joint judiciary and police services. St. John's, capital of the Antigua presidency, is also the seat of the federal gov-

ernment of the colony. Revenue of the colonial government in 1943 amounted to £502,867, and expenditure was £450,287. There are 103 schools throughout the colony, some administered by the government and others by religious denominations, the average attendance being 14,000 pupils. See below for particulars of each of the presidencies.

Antigua.—This is the largest of the presidencies and comprises the island of Antigua and the two dependent islands of Barbuda and Redonda. An administrator, appointed by the governor of the colony, is assisted by a nominated Executive Council and a Legislative Council of 10 members, 2 being officials and 8 unofficials (3 nominated and 5 elected). St. John's is the capital and principal port. In 1940 the United States obtained a 99-year lease for a naval base near Parham Harbor. Revenue of the presidency in 1943 was £219,559, and expenditure amounted to £200,974; the public debt was £79,381. Sugar is the principal crop on Antigua, and cotton on Barbuda; tomatoes, pineapples, and other fruits are also cultivated on a commercial scale, and molasses is manufactured. Sugar production has suffered a setback, the output for Antigua and St. Kitts-Nevis together in 1945 being estimated at only 48,600 tons. The 1945 crop of sea-island cotton on Antigua was put at 289 bales (of 400 pounds each) from 1,111 acres under cultivation. Total exports of the Antigua presidency in 1943 were valued at £343,255, and imports at £464,592. Sugar companies operate 48 miles of railroads. The presidency is served by Pan American Airways.

Saint Kitts (or SAINT CHRISTOPHER)-Nevis.—This presidency includes the dependent island of Anguilla. Basseterre, a seaport on St. Kitts, is the capital, and Charlestown is a port on Nevis. An administrator, appointed by the governor of the colony, is assisted by a nominated Executive Council and a Legislative Council of 11 members, of whom 3 are officials and 8 unofficials (3 nominated and 5 elected). In 1943 the revenue of the presidency amounted to £212,893, and expenditure was £183,962; the public debt was £31,822. The Incorporated Chambers of Commerce of the British Caribbean met at Basseterre in May 1945 to discuss a proposed customs union and encouragement of the tourist trade and commerce with Canada. The principal product of St. Kitts is sugar; of Nevis, cotton; and of Anguilla, salt. There was a reduction in sugar production in 1945 (see *Antigua* above). The presidency's crop of sea-island cotton in 1945 was put at 1,457 bales (of 400 pounds) from a total of 4,550 acres under cultivation (St. Kitts, 625 bales, 1,500 acres; Nevis, 825 bales, 3,000 acres; Anguilla, 7 bales, 50 acres). Exports of the presidency in 1943 were valued at £530,438, and imports at £444,365. Railroads on St. Kitts, with an aggregate length of 36 miles, are operated by sugar companies. St. Kitts has 60 miles of highways, 37 miles having a macadam surface. British West Indies Airways provides a service linking St. Kitts with Trinidad, Jamaica, and Barbados.

Montserrat.—The most healthful and scenic of the four presidencies is Montserrat. The capital and chief seaport is Plymouth. A commissioner, responsible to the governor of the colony, heads the government of the presidency; he is assisted by a nominated Executive Council and a Legislative Council, some members of the latter being elected. The 1943 government revenue was £52,661 and expenditure £51,478. Cotton and

limes, and their products, are the principal crops; Montserrat is one of the world's chief producers of lime juice. The 1945 crop of sea-island cotton (from 3,500 acres) was estimated at 1,452 bales (of 400 pounds). The total value of exports in 1943 was £13,139, and imports amounted to £78,965.

British Virgin Islands.—Least populated of the presidencies, this group comprises some 30 islands, the largest of which are Tortola (21 square miles), Virgin Gorda, and Anegada. Road Town, on the southeast of Tortola, is the capital and principal port. There is no legislative council; a commissioner, assisted by a nominated Executive Council, administering the presidency under direction of the governor of the colony. Revenue in 1943 totaled £17,755, and expenditure amounted to £13,873. Sugar cane, cotton, and coconuts are cultivated, but livestock constitutes the export of greatest value. In 1943 total exports reached £37,146, and imports were valued at £30,026. During 1941–45, £37,027 was granted to the presidency by the British government for the betterment of social and agricultural conditions. See also **BRITISH WEST INDIES**.

LEGISLATION, Federal and State. See **LAW, Sections 7 and 8**.

LEHMAN, Irving, American jurist; b. New York City, Jan. 28, 1876; d. Port Chester, N.Y., Sept. 22, 1945. The brother of the former New York governor, Herbert H. Lehman, Chief Justice Irving Lehman, of the New York Court of Appeals, had served as a member of New York's judiciary for 37 years and was noted for his liberal decisions.

Judge Lehman received his B.A. degree in 1896, his M.A. degree the next year, and his LL.B. degree in 1898, all from Columbia University. He practiced law in New York from 1898 to 1908, when he was elected to the state supreme court for the term 1909–22. In 1923 he was re-elected, upon nomination of both the Republican and Democratic parties, for the state court of appeals. He was re-elected again in 1937 with bi-partisan endorsement, and when in 1939 he was elected as chief judge of the court of appeals in place of Frederick E. Crane, who had retired, he earned the American Labor Party's nomination as well.

The reasoning set forth in an opinion written by Judge Lehman in 1928, which called for voiding an injunction obtained by the Interborough Rapid Transit Company in a dispute with its employees, was largely responsible for shaping New York's labor policy for many years. His opinion upholding the validity of the statute that required owners of old-law tenements to make their buildings conform to improved standards gave an impetus to better housing in New York City. In the case of *Carmen Barber*, a member of the Jehovah's Witnesses who had been convicted for distributing and attempting to sell religious materials without a license, he held that the state was not bound by a contrary decision of the United States Supreme Court limiting the scope of guarantees of religious freedom in the federal Constitution. Judge Lehman was very active in Jewish philanthropic work and in the improvement of Jewish educational institutions.

LEMONS. See **CITRUS FRUITS**.

LEND-LEASE. Victory over Germany and Japan brought to a close the lend-lease program which began in March 1941 and which contributed so

much to the winning of the war. Negotiations with the countries which had received lend-lease aid were begun immediately for the sale to them of lend-lease goods then on hand or in process of delivery.

The Lend-Lease Act became law on March 11, 1941. Under the act the president was empowered to provide goods and services to those countries whose defense he deemed vital to the defense of the United States.

From March 11, 1941 until May 2, 1941 a presidential liaison committee headed by Maj. Gen. James H. Burns conducted lend-lease affairs. It was succeeded by the Division of Defense Aid Reports. With the expansion of operations the Office of Lend-Lease Administration was created on Oct. 28, 1941 under Edward R. Stettinius, Jr. On Sept. 25, 1943 the president consolidated the country's foreign economic operations in the Foreign Economic Administration and transferred to it all lend-lease functions. Leo T. Crowley was appointed administrator. The Foreign Economic Administration was abolished on Oct. 20, 1945 and lend-lease functions were transferred to the newly established Foreign Economic Section in the Department of State.

Procurement of lend-lease supplies and services was handled by the War and Navy Departments, the Treasury, the Department of Agriculture, the Maritime Commission and the War Shipping Administration. By utilizing the established government agencies it was possible to avoid duplication, achieve standardization in allied war goods, and effect savings in procurement. The Foreign Economic Administration helped to formulate lend-lease programs in cooperation with United States government departments and the lend-lease countries, translated the programs into statements of requirements, issued procurement instructions, maintained records, and prepared reports on various phases of lend-lease operations. To Sept. 1, 1945 the president had submitted 20 reports on lend-lease operations to Congress, as required under the Lend-Lease Act. Detailed information on lend-lease operations can be obtained from these reports.

Approximately 15 per cent of the total war cost to the United States represented the cost of the munitions, industrial and agricultural supplies, shipping and other services that the United States furnished to its allies under the lend-lease system.

Total lend-lease aid from the beginning of the program in March 1941 to the end of September 1945 amounted to \$46,040,000,000. Our four principal allies, the British Empire, the USSR, China and France, received about 98 per cent of all lend-lease aid. More than two thirds of the total was supplied to the British in various war theaters and one fourth of the total was supplied to the USSR.

In the months immediately following the passage of the Lend-Lease Act, when Britain was threatened with invasion, most of the goods exported under lend-lease went to the United Kingdom. After the Nazis invaded Russia, lend-lease aid was extended to the USSR. The shipment of vast quantities of lend-lease planes, tanks, and guns, and of industrial, transportation, and communication supplies, aided materially in the successful Soviet offensives that repelled the German invader and prepared for the Soviet advance into Germany from the east, as General Eisenhower's Allied armies drove in from the west. Lend-lease supplies to the Mediterranean area, including Africa and the Middle East, played an

important part in the expulsion of the Nazis from this area and in ending the possibility of an Axis juncture in the East. French, Belgian, Dutch, Norwegian, Polish, Yugoslav, and Greek patriots were equipped with lend-lease arms and supplies and fought alongside Anglo-American forces in the war against Germany.

With the attack upon Pearl Harbor and the German and Italian declarations of war upon the United States, this country faced global war. The stimulus which lend-lease and previous Allied war purchases gave to American industry was rewarding. Conversion to war production was far advanced by the manufacture of lend-lease supplies, and vital industrial experience was gained while America was the arsenal of democracy.

The miracle of American production was soon felt on all the war fronts. In less than one year after Pearl Harbor, the tide of Japanese conquest was turned back at Midway and Guadalcanal, and in less than two years American soldiers, teamed with British and other United Nations forces that had been strengthened by lend-lease aid, invaded North Africa. While great battles were being fought in Tunisia, Algeria, and Italy and on the Soviet Eastern Front and while American forces were storming Jap held islands in the Pacific, the British Isles were being converted into a gigantic invasion base for the liberation of Europe by American lend-lease supplies and British production.

In the Pacific, lend-lease goods and supplies added telling power to the great efforts of Australia and New Zealand, as they developed into important bases in the strategy which defeated Japan. The loss of the Burma Road in April 1942, the Japanese sea blockade of China, and the occupation of Chinese coastal areas seriously hindered the flow of lend-lease aid to China. The Allied supply line was through India. In one of the epic feats of the war, American and Allied pilots flew lend-lease and other supplies from India "over the Hump" to China over the most dangerous air routes in the world.

For the defense of the Western Hemisphere and to aid in the prosecution of the war, the other American republics received \$247,000,000 worth of lend-lease goods. This amount was less than 1 per cent of lend-lease shipments to all areas.

Special lend-lease agreements were entered into with France, Belgium and the Netherlands early in 1945 under Section 3 (c) of the Lend-Lease Act. These agreements provided for payment over a period of 30 years for all goods received and not consumed in the war effort.

The following countries received lend-lease aid during the war: British Commonwealth of Nations, Belgium, Bolivia, Brazil, Chile, China, Colombia, Costa Rica, Cuba, Czechoslovakia, Dominican Republic, Ecuador, El Salvador, Ethiopia, France, Greece, Guatemala, Haiti, Honduras, Iceland, Iran, Iraq, Liberia, Mexico, the Netherlands, Nicaragua, Norway, Paraguay, Panama, Peru, Poland, Saudi Arabia, Turkey, Union of Soviet Socialist Republics, Uruguay, Venezuela and Yugoslavia.

Reciprocal lend-lease aid to the United States from lend-lease countries had a dollar value of \$6,257,000,000 as of July 1, 1945. This aid included capital installations such as airfields, hospitals, barracks and depots; foodstuffs; petroleum products; and shipping, railroad transportation, and other services. The British Commonwealth provided by far the greatest amount

of reciprocal aid, accounting for \$5,921,000,000 of the total amount given above.

Master lend-lease agreements were signed with Belgium, China, Czechoslovakia, Ethiopia, Greece, Iraq, Liberia, the Netherlands, Norway, Poland, the Soviet Union, the United Kingdom, and Yugoslavia. Australia and New Zealand accepted the principles of these agreements. The master agreements provide in Articles V, VI, and VII that defense articles transferred under lend-lease that have not been destroyed, lost or consumed and that shall be determined by the president to be useful in the defense of the Western Hemisphere, or otherwise of use to the United States, will be returned and that in the final determination of the benefits to be provided to the United States by the lend-lease country full cognizance shall be taken of all the benefits the lend-lease country has provided to the United States. Article VII states that in the final determination of benefits to be provided to the United States in return for lend-lease aid furnished, the terms and conditions shall be such as not to burden commerce, but to promote mutually advantageous economic relations and the betterment of worldwide economic relations. "To that end, they shall include provision for agreed action between the signatories, open to participation by all other countries of like mind, directed to the expansion, by appropriate international and domestic measures, of production, employment, and the exchange and consumption of goods, which are the material foundations of the liberty and welfare of all peoples; to the elimination of all forms of discriminatory treatment in international commerce, and to the reduction of tariffs and other trade barriers."

The United Nations achieved victory over Germany and Japan through an effective fighting partnership and a system of combined war supply. Through the weapon of lend-lease the full power and might of American resources was brought to bear against the enemy by the millions of fighting men of the United Nations. When victory over Germany and Japan was won, lend-lease had fulfilled its purpose.

HERBERT WILLETT,
Director of Research and Reports, Foreign Economic Section, Department of State.

LEY, Robert, German Nazi leader: b. Niederbreidenbach, Germany, Feb. 15, 1890; d. Frankfurt-on-the-Main, Germany, Oct. 25, 1945. Chief of the German Labor Front under Adolf Hitler. Dr. Ley was one of the 23 of the Nazis' alleged war criminals awaiting trial in Nuremberg in late 1945, when he committed suicide by hanging himself in his cell on the night of October 25. Ley was largely responsible for the mobilization of German labor to man Nazi war industries. He had a flair for slogan-making, and used to excellent advantage with the German worker such phrases as "strength through joy" and "a German laborer is worth more than an English lord." He was also in charge of Germany's foreign slave labor battalions. As head of the Bund der Auslandsdeutsche, organization of Germans living outside the country, he was given some publicity in the United States during the trials of American Nazis. Ley became a member of the Reichstag in 1932; in 1933, he attended the International Labor Conference in Geneva as Germany's delegate. In April 1945, he was appointed head of the Adolf Hitler Volunteer Corps, an organization whose mission it was to wage guerrilla warfare against the enemy. Ley

was taken by American troops on May 16, south of Berchtesgaden.

LEYTE, lá'tä. One of the islands of the Philippine group, lying north of the extreme eastern part of Mindanao, southwest of Samar, and east of Cebu and Bohol; area, 2,785 square miles; prewar population, about 358,000. Leyte ranks eighth in area among the 7,083 islands in the Philippine chain. Tacloban (tä-klô'bän) is the island's principal port and capital. The interior of the island is mountainous. Mt. Lobi in the north is 4,400 feet high. Some of the mountains are extinct volcanoes. Leyte is one of the best cultivated of the Philippines. Crops include cotton, corn, coconut oil and copra, abacá, sugar, coffee, and rice. Minerals include gold, silver, lead, iron, and sulphur. Leyte, occupied by the Japanese when they conquered the Philippines in 1942, was invaded by American forces under Gen. Douglas MacArthur on Oct. 20, 1944. The soldiers went ashore in the Tacloban area after a devastating naval and air bombardment, and rapidly extended their positions. General MacArthur went along with his men, thus making good his promise, made two years and six months before, to return to the Philippines. Every able-bodied man who escaped from Corregidor before its surrender participated in the invasion. Lieut. Gen. Walter Krueger commanded the ground forces. Efforts to bring in reinforcements cost the Japanese severely, and led to what up to that time was the most disastrous naval defeat in Japanese history; 58 of her ships were hit, and 24 were definitely sunk on October 24. Though she succeeded in putting some reinforcements ashore, on December 26 (December 25, Eastern War Time) General MacArthur announced that, except for mopping-up operations, the Battle of Leyte was over. He placed Japanese losses in defense of the island at 113,221, of whom 54,338 were counted dead. Only 493 Japanese prisoners were taken. General MacArthur stated that 2,748 Japanese planes were destroyed and 27 Japanese warships were sunk in the battle for the island. American casualties, exclusive of naval personnel, were 11,217, of whom 2,623 were killed; 8,422 were wounded; and 172 were missing. In a supplementary report of June 13, 1945, General MacArthur stated that since December 26 the mopping-up had accounted for 26,000 additional dead Japanese, bringing the total for that campaign to 106,000.

LIBERIA. A Negro republic on the west coast of Africa. The coastline on the Atlantic Ocean, extending northwest from Cape Palmas, the most southerly point, is some 350 miles long, while the inland boundaries of the country are Sierra Leone on the northwest and territories of French West Africa on the north and northeast. In some places the republic extends inland for 150 to 200 miles. The area is about 43,000 square miles, and the population is estimated variously at 1,500,000 to 2,500,000. Settled by freed American slaves in 1822, Liberia was recognized as an independent state in 1847. The capital is Monrovia (pop. 10,000.)

The People.—The descendants of the immigrants from the United States (the Americo-Liberians) number some 12,000, all resident along the coast, and half of them in the capital. Other coastal Negroes, amounting to some 50,000 are also considered civilized; many of them, of the Kru tribal stock, are employed as seamen on sea-going vessels. While the Americo-Liberians are Christians, the Kru Negroes are, for the most

part, pagan, and this is true, also, of the other principal tribal stocks, found in the hinterland—the Gissi, Gola, Grebo, Kpuesi and Mandingo—though among the last are found numerous Moslems. Negroes from British and French colonies to the number of about 400 are living on the coast, and there, as well as in the interior, are some 300 European and American missionaries and traders. The principal seaport is Monrovia, and other ports of entry include, from north to south, Robertsport (or Cape Mount), Buchanan (Grand Bassa), River Cess, and Sinoe (Greenville).

Religion and Education.—Practically all of the Americo-Liberians are Protestants, adhering to the Presbyterian, Methodist, Lutheran, Baptist, and Protestant Episcopal denominations. Missions operate about 80 schools; there are also 16 private schools, 5 tribal schools, 2 philanthropic schools, 3 kindergartens, 7 schools maintained by churches, and a further 78 are conducted by the government; these schools have a total enrollment of 15,000, the majority of the population having no educational facilities. The Methodists have a college at Monrovia and an agricultural institute at Kakata; and the government also has a small college at Monrovia with 8 professors and 88 students.

Government.—The constitution of Liberia is modeled on that of the United States, with minor differences. Executive power is vested in a president, elected for an 8-year term, who must be at least 35 years of age and must own unencumbered real estate of a value of not less than \$2,500. He is assisted by a Cabinet of 7 members. The bicameral legislature comprises a Senate, the 10 members being elected for six years, and a House of Representatives, the 21 members of the latter elected for 4-year terms. Electors must be of Negro blood and owners of land; in practice, since 1878 they have been a small clique of Americo-Liberians known as the True Whig Party. The president inaugurated on Jan. 1, 1944, was William V. S. Tubman; with his predecessor, Edwin J. Barclay, he visited Washington in May 1943. The municipality of Monrovia, which constitutes a commonwealth district, is appointed by the president. Liberia, as a member of the United Nations, was represented at the San Francisco conference of the United Nations Organization held in April 1945.

Finances.—In 1943 the revenues of the government amounted to \$1,429,936, while the expenditures totaled \$1,044,647. The external bonded debt stood at \$1,193,000 on Jan. 1, 1944, while the internal floating debt was \$74,666; these debt items are given in U.S. dollars, which became legal tender in 1942. While there is a Liberian coinage in silver and copper, silver coins of British West African colonies are in more general use.

Defense.—Nominally, all citizens between the ages of 16 and 45 years, capable of bearing arms, are liable for military service. There is a militia organization which, with volunteers and members of the police force, numbers about 10,000 men, as well as a Frontier Force of (1943) some 750 men on long-term enlistments. With defense of the country deemed to be in the interest of the United States, an agreement was reached on March 31, 1942, whereby American troops were stationed in the republic; they assisted in a reorganization of Liberia's defense forces and built airfields. On Jan. 26, 1944, Liberia declared war on Germany and Japan; and on Feb. 18, 1945, the country was praised by United States Secre-

tary of State Edward R. Stettinius, Jr., for its vital contribution to the war effort of the United Nations. Mr. Stettinius cited Liberia's granting of air bases, which "proved invaluable in flying the great air supply route to the Near East, to India, and to China," and the country's greatly increased production of rubber.

Production.—The country's resources have been but little developed. Farms are small and worked in primitive fashion, farming being conducted mostly for domestic consumption. The dense forests are rich in varieties of palm, the products of which form a considerable part of local exports. Tropical fruits are plentiful, and there is a small production of cacao, cassava, coffee, sugarcane and cotton. Cattle, found in the towns and settlements near the coast, are of small stature, and are rarely slaughtered for food; there are a few horses, goats and sheep, the last bearing hair instead of wool. The extensive rubber plantations of the Firestone Company constitute the country's most important industrial activity; the 77,000 acres of matured rubber trees yield upward of 20,000,000 pounds of manufactured latex rubber annually. The plantation managers have done much to raise the standard of living among their workers, notably in the encouragement of rice cultivation and in the improvement in hygienic conditions.

The known mineral resources of the country have yet to be adequately exploited. Alluvial gold mining increased during the war, the value of the output in 1943 equaling that of all other products exported with the exception of rubber. Copper and iron deposits are also worked, though on a small scale. Diamonds have been found in fair quantity, but many minerals still await development.

Foreign Trade.—The principal imports are automobiles and accessories, cotton goods, gasoline and other petroleum products, industrial chemicals, iron and steel containers for Liberian exports, leaf tobacco and cigarettes, and rice. Total imports in 1943 were valued at \$4,679,602, as compared with \$4,732,446 in 1942. The 1943 exports had a value of \$8,997,896, as compared with \$8,151,023 in 1942. The principal export to the United States was rubber, and other countries, principally South American, took Liberia's remaining exports, the chief of which were piassava, palm-kernels, palm-oil and cacao.

Communications.—There are no railroads in the republic, motor trucks affording the only vehicular means of transport. Main highways, which had a total length of 345 miles in 1942, underwent considerable extension with the assistance of American military engineers. During the war Liberia became an important point on the routes for aircraft traveling from the United States to Egypt and to the Belgian Congo. The St. Paul River is navigable for 25 miles from the sea northward, and motor launches ply between the coastal ports. There is cable communication with Dakar, and thence to all the world, and the government operates wireless stations at Monrovia, Bassa, Harper and Kolahun. The Firestone Company has its own wireless stations, and telephone and telegraph services on its plantations.

LIBRARY ASSOCIATION, American. See AMERICAN LIBRARY ASSOCIATION.

LIBRARY OF CONGRESS. Following the resignation of Archibald MacLeish as librarian of Congress in December 1944 to accept an appointment as assistant secretary of state, Dr.

Luther Harris Evans, the chief assistant librarian, assumed the duties of acting librarian. His nomination for the librarianship by President Truman on June 18, 1945 was unanimously confirmed by the United States Senate, and he assumed office as the tenth librarian of Congress on June 29. A native of Sayersville, Bastrop County, Texas, Dr. Evans had served as national director of the Historical Records Survey of the Work Projects Administration from 1935 to 1940. As chief assistant librarian he was intimately concerned with the reorganization of the Library of Congress from 1940 to 1944, and with the declaration and development of its policies during that period.

At the close of the fiscal year, June 30, 1945, the collections of the library included 7,877,002 printed books and pamphlets, 1,703,599 volumes and pieces of music, 1,639,505 maps and views, 575,083 fine prints, 936,412 photographic negatives, prints, and slides, more than 7,900,000 manuscripts, 43,343 microfilm reels and strips, 11,955 motion picture reels, and 123,134 phonographic recordings.

As in the years preceding the Second World War, the acquisitions problem centered on obtaining materials related to the government's war program and the library's resources of current materials were greatly strengthened through acquisitions from accessible foreign markets. With the end of the conflict, the problem became one of acquiring publications which were inaccessible during the war. To this end the library is endeavoring, through co-operative enterprise, to secure for its collections and for other collections in the country all essential foreign materials covering the war period.

Among the notable accessions of the year, mention is made of the following: a collection of Woodrow Wilson's letters, covering the period 1906-12, to Col. George Harvey, relating to Harvey's early support of Wilson and to the famous "break" between the two men; the papers of the late Senator Nelson Wilmarth Aldrich (a gift from his sons and daughters); the originals of more than 1,100 cartoons by Clifford K. Berryman of the Washington *Evening Star*, covering a span of 50 years (presented by Mr. Berryman); 20 rare early editions of Cervantes' *Don Quixote* including the "true" first English edition (by gift); the original manuscript musical score of the operetta *Marinka*, the first work composed by Emmerich Kalman in America (presented by the composer); an original copy of the Bill of Rights, one of 14 copies engrossed in December 1789 at the order of the First Congress (a gift of Barney Balaban); the manuscript of Abraham Lincoln's historic "But you must act" letter to Gen. George B. McClellan, April 9, 1862, and the manuscript draft of Lincoln's telegram of Sept. 12, 1862—"How does it look now?"—to McClellan; papers of five generations of the McPherson family of Gettysburg, Pa., dating from 1715 to 1936, of particular value for the study of state and national politics, economic conditions, and the history of Gettysburg and its vicinity; two manuscripts of Prof. Albert Einstein; his first essay of the theory of relativity *Zur Elektrodynamik bewegten Körper*, and *Das Bi-Vektor Field*, embodying some of the scientist's latest researches; a unique collection of musical manuscripts, personal documents, and pictorial material relating to the violinist-composer Niccolò Paganini, acquired through the generosity of Mrs. Gertrude Clarke Whittall, including four unpublished quar-

tets for violin, viola, violoncello, and guitar in manuscript, his diaries and account books, his correspondence with members of his family and with royalty, and many unpublished drawings and water colors by famous artists of his day; the manuscripts of three new ballets by Aaron Copland, Paul Hindemith, and Darius Milhaud, and the manuscript of Walter Piston's *Partita* for Organ and Strings; the manuscript journal of Harriet Low, 1829-34, in nine volumes, written at Macao and Canton, the most detailed description now known of the social life of the early American and British traders to China; a collection of 50,000 photographs and their negatives from the American Red Cross, dating from the beginning of the 20th century to 1933; an extensive collection of war maps, including 92,000 sheets from the Army Map Service; the John Cleves Short collection of papers of the Short, Harrison, Symmes, and allied families, numbering approximately 13,000 pieces, and covering a wide range of social and economic history of an extensive area of the United States from the late 18th century to the middle of the 19th; a large group of etchings, water colors, and drawings of Frank Benson (by bequest); and over 150 fine prints, by purchase from the Pennell Fund, including 35 prints awarded prizes at the Third National Pennell Fund Exhibition of Prints in the Library of Congress.

Pursuant to a recommendation included in the final act of the Inter-American Conference for the Maintenance of Peace, held at Buenos Aires in 1936, that each American republic issue a quarterly devoted to recently published works in science, history, literature, and art, to be distributed and exchanged among the American republics, the Library of Congress established, and published the first two issues of *The United States Quarterly Book List* under the editorship of Dr. Joseph P. Bliksensderfer. In the formulation of general policies, the library was aided by an advisory committee composed of distinguished representatives of the American Council on Education, the American Council of Learned Societies, the National Research Council, the Social Science Research Council, and other organizations. A phase of the program of the Interdepartmental Committee on Cultural and Scientific Co-operation of the Department of State, the *Book List* presents reviews of significant new books by American authors published in the United States. Some 400 scholars throughout the country co-operated in the selection and reviewing of publications for the quarterly.

Publication of the *Guide to the Law and Legal Literature of Cuba, the Dominican Republic and Haiti* continued the contributions of the Law Library to legal bibliography and inaugurated a new series of guides to the law and legal literature of the Latin American republics. To the field of Latin American bibliography a further contribution was made in the *Guide to Latin American Periodicals Currently Received in the Library of Congress and in the Library of the Department of Agriculture*, the fruit of the co-operation of numerous specialists here and in South America. Other publications meriting individual mention are *Anglo-American Legal Bibliographies; A Bibliography of Early Secular American Music*, by Oscar G. T. Sonneck (1905), revised and enlarged by William Treat Upton (1945); the second and final volume of *Eminent Chinese of the Ch'ing Period; Catalog of Early Books on Music* (before 1800),

and supplement (1913-42) with a *List of Books on Music in Chinese and Japanese*; and five albums of the series *Folk Music of the United States*, by the Archive of American Folk Song.

On the occasion of the 80th birthday of Mrs. Elizabeth Sprague Coolidge and of the 20th anniversary of the establishment of the Coolidge Foundation in the Library of Congress, the foundation sponsored its 10th festival of chamber music in the Coolidge Auditorium. The three new ballets by Aaron Copland, Paul Hindemith, and Darius Milhaud, a *Partita* for Organ and Strings by Walter Piston, all commissioned by the foundation, and two works for two pianos—a *Sonata for Two Pianos* by Igor Stravinsky and *Second Avenue Waltzes* by Vittorio Rieti—received their world premières. The Copland ballet, *Appalachian Spring*, received the Pulitzer Prize for the outstanding American composition of the year and citation as the best theatrical work of the season. The Coolidge Foundation sponsored 9 chamber music concerts in the Library of Congress and 37 extension concerts in universities and schools from coast to coast. Of the 18 concerts presented in the library under the auspices of the Whittall Foundation, 16 were performed by the Budapest String Quartet.

On the basis of a subvention from the Rockefeller Foundation the library has established a program of grants-in-aid for studies in American history and civilization. An administrative committee composed of the chief executive officers of the major research councils, assisted by an advisory committee representing leading universities, designates the recipients of grants for research and writing in the history and civilization of the United States. The principal functions of the Library of Congress in the administration of the project are the distribution of grants to recipients and suggestions to the administrative committee of fields of American history in which scholarly study is shown to be necessary or desirable.

A further grant of \$47,800 from the Rockefeller Foundation provided means to enable the library to prepare a suitable record of its holdings of Slavic materials. It is an important initial step toward the establishment of the proposed Slavic Center in the Library of Congress. This grant follows an earlier one of \$12,000 under which a survey of the holdings of Russian materials in American libraries has been conducted. The results of the survey will serve as a union list of standard Russian works in the major disciplines and will provide the basis for a co-operative program for developing Russian collections in the United States.

As the outcome of a number of conferences held in the library relative to the employment of the library's facilities and the services of its Books for the Adult Blind Division, in the program for the rehabilitation of war-blinded servicemen, the library prepared special books and provided talking book machines for the use of veterans in hospitals and for the continuation of this service in their homes.

At the request of the Department of State, the Library of Congress established and administered a library for the United Nations Conference on International Organization at San Francisco. A basic collection of 3,000 volumes, supplemented by interlibrary loans from co-operating libraries in the area, provided resources for research for the delegations of all participating countries. The staff was recruited from

the Department of State, the University of California, the Council on Foreign Relations, the United States Navy, and the Library of Congress. The Conference Library was the first instance on record of a special library service for the use of all delegations to an international conference.

ROBERT C. GOOCH,
Chief, General Reference and Bibliography Division.

LIBRARY PROGRESS. With the cessation of hostilities in Europe and later in the Pacific, the planning of librarians has been dominated by adjustment for service to the veteran and his family, to the present or the displaced war worker, to the man out of a job, and to the young person who is planning his life to come, in a peacetime world. Librarians, at the instigation of the American Library Association, co-operated with the Department of State in giving leadership and assistance in a nationwide program of study on the problems of building the peace. With the support and active co-operation of libraries, the Book and Author War Bond Committee, composed of librarians, authors, publishers, and the book trade, sold over \$160,000,000 worth of bonds through educational campaigns and rallies, in over 70 of the larger cities of the nation. For a complete coverage of the war and post-war activities of libraries during 1945 see all issues of the *American Library Association Bulletin*, *College and Research Libraries*, and the *Library Journal*.

International Relations.—The challenge, the opportunity, and the responsibility of American libraries to co-operate with libraries in other parts of the world stand out more impressively than ever before. The American Library Association continued to administer American libraries in the capital cities of Mexico, Nicaragua, and Uruguay with funds provided by the Department of State. Further Latin American co-operation resulted from a \$25,000 Rockefeller Foundation grant, used to finance an administrative study of the National Library of Brazil, Rio de Janeiro; to send a specialist in rare books to visit various library centers, and to bring outstanding librarians and archivists to the United States. Many have visited the United States during the year. Additional grants continued the Books for Latin America project and the Mexican Union catalog. Library schools were conducted in Peru and Uruguay. In Rio de Janeiro, the city authorized the establishment of 20 public lending libraries, and a course for librarians will be held at the National Library. Students from Argentina, Brazil, Costa Rica, Nicaragua, Peru, and Panama have attended North American library schools.

In 1944-45 the Rockefeller Foundation again gave a grant of \$70,000 for the purchase of subscriptions to about 360 scholarly and scientific journals to be stored in this country for distribution to foreign libraries after the war. A further grant of \$90,000 for 1945-47 was also made for the purchase of outstanding books of reference and research for libraries in war areas. Another grant of \$2,500 provides for a campaign to secure large quantities of books of permanent value for libraries in war areas.

In June 1945 the American Book Center was established, under the auspices of several national library associations, in order to co-ordinate the efforts of many groups interested in collecting gift books for restocking libraries in war areas of the Allied Nations. The American Book Center proposes to conduct, at an early date, a cam-

paign for gifts of printed materials useful for scholarly investigation, and for the physical, economic, industrial and social rehabilitation of devastated areas. It is estimated that more than 1,000,000 usable pieces will be collected and allocated. After needs of the Allied Nations have been met, allocation may be extended to non-allied countries, upon the recommendation of the Department of State.

From replies to A.L.A. letters regarding the conditions of libraries at the cessation of hostilities in Europe it was learned that many of the librarians who were expelled from their libraries have returned; that libraries are attempting to fill the gap caused by five years of war; that librarians and patrons are starved for news and publications of the war years; and that they are anxious to rebuild, where necessary, and continue the restoration of library service and activities from where they were interrupted because of wartime conditions.

Early in 1945, Milton Lord, librarian of the Boston Public Library, visited the American Library in Paris, as representative of the American Library Association which founded the library in 1918, with books sent overseas for the use of service men in the First World War. Books and funds are now being solicited for the library in order to expand its usefulness in the postwar period.

Carl M. White, director, Columbia University Libraries, spent several months in London, serving as library consultant for the United States delegation to the Conference of Allied Ministers of Education.

During April and May 1945 libraries were represented at the United Nations Conference at San Francisco, by Carl H. Milam, executive secretary of the American Library Association, who attended as a consultant appointed by the American Council on Education. A conference to develop an international organization for education and cultural relations is being planned as an outgrowth of that conference.

American libraries in London, Sydney, Melbourne, Wellington, Johannesburg, Bombay, Cairo, Cape Town and Lisbon, operated during wartime by the Office of War Information, have been transferred to the jurisdiction of the Department of State. New American libraries and reading rooms are opening from time to time under this program—some in occupied countries since the declaration of peace.

Negotiations are under consideration to secure an expeditious interchange of cultural materials between the United States and Russia. The State Library of Foreign Languages in Moscow reports that it has several thousand regular readers organized into classes for the study of the history and culture of Allied countries. The USSR states that 1,000,000 books—57,000 titles in 100 languages—have been published during the war in Russia.

The State Department has allocated two grants of \$50,000 each to the American Library Association, with which American books will be bought for China through 1945 and 1946. Dr. T. L. Yuan, of the National Library of Peiping, which has been doing co-operative purchasing of Chinese materials for 13 American libraries, spent considerable time in the United States visiting libraries during the year 1945.

Federal and State Aid.—The Library Service Division of the United States Office of Education and the Federal Relations Committee of the American Library Association have been con-

cerned with the following problems: surplus property, including surplus army camp libraries; federal interest in educational facilities, especially the House Committee on Education's proposals for aid to colleges adversely affected by the war; a bill for federal aid to educational building programs; and the book postage rates. Concessions have been gained on library postage which will probably prevent an additional annual charge of more than \$100,000 on library books.

Increasing momentum in state aid to libraries was apparent in legislation, appropriations, and establishment of large unit libraries in 1945. Appropriations for state library extension agencies were generally increased—in several states more than 50 per cent—and a small first appropriation was made in Montana. State aid appropriations were made for the first time in four other states: \$283,000 for the biennium in Washington, \$20,000 for the second year of the biennium in Maryland, and smaller amounts in New Mexico and South Carolina. Illinois appropriated \$300,000 and Michigan \$371,625 for the biennium. Connecticut appropriated grants for small libraries. At least four states, Michigan, New York, California and Virginia, are making extensive studies of municipal revenue problems.

The number of counties with county or regional library service increased in 26 states, with a total gain of 71 for 1945.

The A.L.A. Library Extension Board marked the 20th anniversary of its organization. Formed for "organized effort toward the goal of adequate public library service within easy reach of everyone in the United States and Canada," it has attempted to build a foundation of informed public opinion particularly through work with national agencies; to interest librarians in new movements such as state planning or state aid for large library units; to provide basic materials and information, and to give advisory service. In 1925, people without public library service constituted 43 per cent of the population of the United States. In 1945 it was 26 per cent. However, the increased population during that period makes the reduction in the actual number of people without libraries—from 45,069,897 to 34,748,334—seem less encouraging. Most of these live in rural areas. The number of counties without a single public library within their boundaries has dropped from 1,135 to 587. Acknowledging that progress has been made, the A.L.A. Council expressed the belief "that national, state and local plans for educational and social progress in the postwar period can set no less a goal than public library service for all the people of the United States and Canada."

School Libraries.—Results of library planning for service to youth were published in *School Libraries for Today and Tomorrow* (A.L.A. 1945) and *A Charter of Education for Rural Children* (U. S. Government Printing Office, 1945). In a number of states, aid to school libraries has assisted schools, especially in rural areas, to build up minimum library service. In the 1944-45 school year some of the expenditures of state aid specifically allocated for school libraries were: Connecticut, \$15,000; Florida, \$64,008 (about double last year's budget); Georgia, \$141,071; New Jersey, \$10,000; North Carolina, \$118,522; Tennessee, \$38,062; Virginia, \$150,000; and Wisconsin, \$166,096.

Adult Education.—A current Gallup poll indicated that 25,000,000 adults would like to enroll in adult education courses after the war, with interests divided primarily between vocational

courses and professional and scientific study. In this connection, the A.L.A. Adult Education Board expressed the belief that "continuing self-education is essential in a democratic society and that the library is potentially the best single source for informal self-education." As a source of informal education, the library is often the only institution available to many who wish to participate in such study, according to the board's annual report. The board also reported that there is a great need for civic education, for family life education, and for the greater development of other cultural courses as a part of the library's service to individuals and groups. Library adult education and readers' advisory services have reported an increasing demand for material and courses of study on rehabilitation, reconversion and reconstruction. Many experienced army camp librarians are being sent overseas to work with the European and Pacific armies of occupation, and to supplement the army's planned educational programs. The army increased the distribution of special service editions of books from 20,000,000 to 50,000,000 during the year.

Library Personnel.—Requests from employers for both experienced and inexperienced library school graduates still far outnumber the candidates available, although with the end of the war some librarians will be returning to their former positions. Salaries for graduates of the 1945 classes were in general from \$200 to \$300 higher than for graduates of 1944, with \$1,800 as the minimum salary reported by most of the library schools, whereas in 1944 that amount was the average. There is a trend upward for all library salaries. Many libraries are adopting classification and pay plans, among them the public libraries of Cleveland, Detroit, Newark and the Library of Congress.

Library Training.—For the first time since 1940, when the decline in enrolments began, the library schools reported an increase in the number of students in comparison with the preceding year. In the 32 accredited library schools in the United States, 1,032 students were enrolled in 1945, compared with 917 for the fall of 1943. In the two Canadian library schools, 41 students were enrolled in 1944-45, whereas 25 attended the previous year. Enrolments in 1945 summer sessions also showed an increase over those of 1944. In 1945, recruiting for the library profession received major attention from the American Library Association.

The end of the war in Europe brought closer to the library schools the need to provide courses for veterans and several have enrolled former members of the armed forces. Most library schools are ready to offer the training required, whether in refresher courses, special programs, or other adaptations of the regular curriculum, and they will follow the policies of their institutions in such matters as the admission of students at irregular times or the acceptance of credit for educational training and experiences received in the armed services.

Gifts, Grants and Buildings.—During the war years, the number of large gifts to libraries decreased, but smaller gifts, collections of books, and private libraries continue to add to the resources of libraries. Among private collections given to libraries were: to Stanford University Library, the Hutton Webster Folklore Collection; to the library of Southern Illinois Normal University, a Lincoln and American history collection donated by Clint Clay Tilton; to University of Illinois Library, a 6,000-volume economics

library from Janet Weston, in honor of her father, late professor at the university; to Minneapolis Public Library, \$50,000 from the Citizens Aid Society, to be expended over a five-year period; to Columbia University Library, a collection of classics and incunabula from the late Dr. Gonzalez Lodge; to The Free Library of Philadelphia, 17th century Shakespeare folios by P. A. Widener and Mrs. Josephine Widener Wichfeld; to Texas Christian University Library, de luxe limited editions of American, English, and French literature and history from Mrs. Goodall H. Wooten in memory of her husband; to the town of Muscoda, Wis., the library, home and personal property of Dr. Charles R. Pickering; to the Library of Congress, a Rockefeller Foundation grant of \$47,000 for the establishment of a Slavic Center; to the Tulsa Public Library, the Diggs library of classical literature and history by the Tulsa Jewish Community Council; and to the University of Arizona Library, several thousand books, valued at over \$10,000 from the Friends of the Library.

Gifts of money and funds for building included: to Newark (Ohio) Public Library, \$27,500 under the will of Mrs. Jessie Clark Thomas; to Cairo (Ga.) Public Library, \$35,000 by the Roddenberg family; to the Kewanee (Ill.) Public Library, a \$25,000 trust fund in memory of Edward Poole Lay; to the Jewell (Ia.) Public Library, \$25,000 for the establishment of the E. W. Montgomery Memorial Library; to the Avon (Mass.) Public Library, \$82,000 under the will of H. Lawton Blanchard; to Princeton University, \$1,000,000 from the Firestone family toward a \$3,500,000 Harvey S. Firestone Memorial Library; to the Elmwood (R.I.) Public Library, \$100,000 under the will of Mrs. Sophie Knight Rousmanieve; to the Pomeroy (Wash.) Public Library, \$10,000 from Mary Liggett; to Walla Walla (Wash.) Public Library, \$20,000 by the will of T. C. Elliott; to Lake Geneva (Wis.) Public Library, \$100,000 from Mrs. Mary Gudley Bell; to Bradley Polytechnic Institute, Peoria, Ill., \$37,500 from Friends of the Library for a new library building; and to the Technological Department of the Carnegie Library of Pittsburgh, \$66,195 from the Pittsburgh Chapter of the American Chemical Society to supplement regular book funds.

Because of war limitations on construction, very little new building has been accomplished but numerous are the plans being made by libraries for new buildings within the near future. Following are some: Oakland (Calif.) Public Library, a main building and four branches; California Academy of Sciences, San Francisco, a new building to be shared by the library, museum and science laboratories; Paine College Library, Augusta, Ga., a \$100,000 building; University of Iowa Library, \$1,000,000 building; Forbes Library, Williamstown, Mass., a separate children's building; the Cincinnati Public Library, \$3,500,000 building; the San Diego Public Library, \$100,000 initial appropriation for building.

Publications.—Other publications in the library field in addition to those mentioned under American Library Association are: Carnovsky and Martin, eds., *The Library in the Community* (University of Chicago); Rider, *The Scholar and the Future of the Research Library* (Hadam); Lydenberg and Archer, *The Care and Repair of Books* (Bowker); Rankin, *Children's Interests in Library Books of Fiction* (Contributions to Education No. 906, Columbia University); Hackett, *Fifty Years of Best Sellers 1895-1945* (Bowker); Davis, *Pictorial Library Primer* (Demco Library Supplies); Frederic G. Melcher, *Friendly Reminiscences of a Half Century Among Books and Bookmen* (Book Publishers' Bureau); Wilson and Tauber, *The*

University Library: Its Organization, Administration and Functions (University of Chicago); Dewey, *Abridged Decimal Classification*, 6th ed. (Forest); and Sears, *List of Subject Headings for Small Libraries*, 5th ed. (H. W. Wilson). See also article, *American Library Association*.

MILDRED OTHMER PETERSON,
American Library Association.

LIBYA. North African territory bounded on the east by Egypt and the Anglo-Egyptian Sudan, and on the west by Tunisia and Algeria; southward, it extends into the Sahara to a line between the 23d and 18th parallels, being bounded by French West and French Equatorial Africa. The total area is about 435,000 square miles, and the population is estimated (1945) at 1,000,000. Libya was under Italian administration prior to the Second World War, the four provinces fronting on the Mediterranean (Tripoli, Misurata, Bengasi, and Derna) being incorporated in the national territory of Italy as Libia Italiana on Jan. 9, 1939; Libyan Sahara, to the south, constituted a military territory.

With British conquest of the territory in 1942, former designations of Libya were resumed—to the eastward, Cyrenaica (area, 300,000 square miles; pop. 250,000); and to the westward, Tripolitania (area 135,000 square miles; pop. 750,000). For political reasons, France maintains a detachment at the Cufra (Kufra) Oasis of Cyrenaica, which French forces from the Tchad Colony had occupied in 1941, but the area is under British administration. A column from Tchad Colony had also occupied southern Tripolitania; this remains under French administration, the dividing line between the French and British spheres being a line which runs roughly from south of Hun (Hon) to north of Gadames (Ghadames).

With the exception of southern Tripolitania, all of Libya is under British military government, Brig. T. R. Blackley heading the Civil Affairs Administration in Tripolitania and Brig. Donald C. Cumming that in Cyrenaica. Tripoli (pop. 110,000) and Bengasi (65,000) are the administrative headquarters of Tripolitania and Cyrenaica, respectively. During the financial year ended June 30, 1943, the cash revenue of Tripolitania amounted to £230,359 and expenditure was £779,941, the net deficit being £549,582; Cyrenaica had revenue of £233,062 and expenditure totaling £606,072, the deficit amounting to £373,010.

All Italian nationals had been removed from Cyrenaica prior to the British occupation with the exception of the bishops of Bengasi and Derna and some 80 individuals. The native population, of comparatively pure Arab and Berber stock, are of the Senussi Tariqa sect of Moslems; Sayid Muhammad Idris el Senussi, unchallenged head of the sect, who had been in self-imposed exile in Egypt for 13 years, was consulted by the new administration on matters affecting the native population. Along the green coastal areas in the vicinity of Jebel al Akhdar Italian settlers had displaced the Moslem inhabitants; they established vineyards and orchards of olives, almonds, and peaches, and grew wheat on a considerable scale. Arab tenants were installed on the abandoned farms by the British administration and provided with modern agricultural machinery, and since then the country has produced all its own foodstuffs. In 1942 Egyptian currency was declared legal tender, the rate of exchange being £E1 for 492 Italian lira. An Italian-built railroad operates between Barce and Bengasi (66 miles), and during the war the

Egyptian coastal railroad was extended into Cyrenaica as far as Tobruk (Tobrukh). The 500 miles of good highways constructed by the Italians were extended considerably in the course of military operations.

Unlike the case in Cyrenaica, most Italian inhabitants remained in Tripolitania after the Axis retreat, some 40,000 being gathered in the towns and the fertile coastal strip; there was also an ancient Jewish community of 23,000. While some Fascist sympathizers were removed, the British administration found ready support among most of the Italian civil officials, the judges and physicians. The Berber and Arab inhabitants also co-operated, their schools being reopened and the pilgrimage to Mecca being renewed. The Italian-fostered settlement schemes were taken over by the administration, every encouragement being given to the production of wheat and other foodstuffs; a large para-statal concern which enjoyed the monopoly of tobacco production was also taken over. A new currency, the Military Authority lira, was introduced and became the only legal tender. Since Italian banks had closed and, on the orders of their government, had distributed their funds to the Italian Red Cross and other institutions in Tripoli, a British bank commenced operations in the territory in March 1943. Italian-built railroads radiate from Tripoli to Zuara (68 miles), Garian (61 miles), and Tagiura (13 miles), the last being extended during the war to Homs.

With the end of hostilities, during 1945 the disposition of Libya brought forth several conflicting claims. In the House of Commons on Jan. 8, 1941, Anthony Eden, secretary of state for foreign affairs, declared it was the policy of the British government not again to permit the inhabitants of Cyrenaica to come under Italian rule, but no assurance was given that Tripolitania would not again fall under Italian domination; on Sept. 21, 1943, however, Prime Minister Winston Churchill announced that the Italian empire overseas was "irretrievably lost." Anthony Eden, again in the House of Commons, stated on Jan. 17, 1945, that "the Italian government have no right to the return of any one of their colonies. What is done about the colonies is a matter, in some part, for discussion in the future." Nevertheless, Italy hoped to retain Libya. In a letter to Secretary of State Byrnes on Aug. 22, 1945, Italian Foreign Minister A. de Gasperi wrote: "We gather that while no objections are raised against Italian sovereignty in Tripolitania, strategic guarantees are being sought in Cyrenaica in order to afford full security to the bordering countries and to the international sea routes. We believe that such a security could be obtained through the establishment of 'strategic areas,' air and naval bases, and other guarantees in the Tobruk sector and in Marmarica, without depriving Italy of the sovereignty on the Cyrenaica plateau, which she has already partly transformed into a suitable territory for her agricultural emigration." It was reported that when the meeting of the Council of Foreign Ministers opened in London in September the United States favored a United Nations' trusteeship for Libya (perhaps with Italy as the administering power), but on September 18 the Soviet Union put forward a claim for Russian trusteeship of the territory on behalf of the UNO. The Arab League (q.v.) countered this proposal with the suggestion that both Tripolitania and Cyrenaica be given full independence, and on September 25 Abdul Hamid Badawi Pasha, the

Egyptian foreign minister, declared that if this was unacceptable then both areas should come under the trusteeship of his own country. British policy for the disposition of Libya was not announced.

LIECHTENSTEIN. An independent principality in Europe, lying east of the Rhine River, opposite the Swiss canton of Saint Gallen. The area is 65 square miles; the population (11,218 in December 1941) is of German origin, and nearly all are of the Roman Catholic faith. The state has been politically independent since dissolution of the German Confederation in 1866. Prince Francis Joseph II (born 1906), the present ruler, succeeded Francis I, his great uncle, July 25, 1938; in 1943 he married Countess Gina von Wilczek (Princess Georgine). The capital is Vaduz (pop. 2,020). A constitution adopted in October 1921 provides for a diet of 15 members, elected for four years by direct vote based on universal suffrage. On Feb. 17, 1945, the Federal Council of Switzerland (with which the principality is affiliated economically), yielding to Allied demands, blocked all German holdings in the two countries pending examination of individual accounts by a mixed commission. Because of "lack of freedom of action," on July 21, Dr. Josef Hoop, the premier, informed the Liechtenstein Diet that he and his Cabinet had decided to resign, their usefulness having been impaired. It was not until Sept. 3, 1945, that the Diet selected Alexander Frick, leader of the Conservative Party, to head a new administration. The budget for 1945 estimated revenue at 2,821,150 (Swiss) francs and expenditure at 2,881,083 francs; the public debt stood at 2,669,615 francs. Schools in 1942-43 numbered 62 (42 elementary and 20 continuation schools), with 1,701 pupils. Liechtenstein has no military force. The occupation of the people is chiefly agricultural. Wheat is raised and fruit trees cultivated, while there are considerable numbers of livestock. Other products of the principality are lumber and marble, and industries include textiles, leather goods, and pottery manufacture. The country is within the Swiss Customs Union; and Switzerland also administers the postal and telegraphic services.

LIFE INSURANCE. At the beginning of 1945, 70,000,000 Americans, half of the entire population of the United States, owned life insurance in the legal-reserve companies of the country, for an aggregate amount of \$149,071,000,000. The new business issued in 1944 amounted to \$14,591,000,000. In that year, these same companies paid or credited to their policyholders and beneficiaries a total sum of \$2,528,000,000. At the beginning of 1945 the companies held assets of \$41,054,000,000, most of which covered the legal reserves which, together with much smaller voluntary reserves, have been established to make certain that all future policy benefits will be fully paid when they fall due.

Mortality.—Data for the first eight months of 1945 indicated that, aside from war deaths, the year 1945 will rank among the years of relatively low mortality in the United States. Indeed, civilian mortality in this country was remarkably low during the entire four years of war which started with the attack on Pearl Harbor, Dec. 7, 1941. The record for the armed services was, of course, of a different nature. In the first eight months of 1945, i.e., up to the termination of the war in August, war deaths resulting directly from enemy action comprised about 13 per cent of total deaths among

ordinary policyholders, as compared with 8 per cent for the year 1944; the corresponding figure for the full year of 1945 was estimated to be about 10 per cent. The proportions among industrial policyholders were considerably smaller because of the larger ratio of women and children insured under policies of this type.

War Risk.—Policies issued by most companies during America's participation in the war included war risk provisions which limited the insurance company's liability in event of death while the insured was in military service. The companies absorbed the war risk on practically all of the policies issued before the war, but the safety of the insurance of the general body of policyholders demanded that the companies take the necessary precautionary measures in respect to new insurance. The extra hazard of war was a risk which was properly assumed for a limited amount by the federal government in the form of National Service Life Insurance. Following the Japanese surrender, most companies discontinued the general use of war risk limitations in new policies. A number of companies also took action on the elimination of the war clause on outstanding policies.

Interest Earnings.—One of the major difficulties experienced by life insurance companies in recent years has been that of finding an adequate volume of appropriate and remunerative investments for their funds. During the war the only substantial outlet for new funds was government bonds. In the period from the attack on Pearl Harbor to the Japanese surrender, the American life insurance industry added a net amount of about \$10,000,000,000 to its portfolio of federal and dominion government bonds. Market offerings of corporate securities were relatively scarce, although the volume available in 1945 was the largest in over a decade. However, a major portion of the nongovernment financing was for refunding rather than for new capital.

Leaving out of account the temporary effect of asset gains, the interest rate earned during 1945 on the aggregate of life insurance companies' assets continued the steady decline characteristic of recent years. This reflected to a marked degree the low yield obtainable on suitable new investments, particularly on government bonds which represented almost 50 per cent of the assets of the companies at the end of 1945, and also on new issues and open-market securities generally.

Legislation.—Continued progress was made in 1945 in the nationwide legislative program to have new standard valuation and nonforfeiture laws enacted in the individual states. To the end of September 1945, the proposed standard legislation had been enacted by 23 states; there are perhaps 11 other states in which the proposed measures appear acceptable under existing statutes. The proposed legislation has been recommended by the National Association of Insurance Commissioners and endorsed by many life insurance organizations. It provides for the use of modern mortality tables, and dissociates, to a greater extent than do current laws, the minimum nonforfeiture requirements from the policy valuation basis. It also provides a new method of determining minimum nonforfeiture values under which such values are more nearly related to the real equities of the policyholder at the time of default than has been true under existing nonforfeiture legislation.

After the Supreme Court of the United States had decided in June 1944 that insurance

is commerce, and when conducted across state boundaries, is interstate commerce as respects such statutes as the federal Sherman Anti-Trust Act, legislation which had been introduced in Congress in this connection became of acute interest to the whole insurance business and to the state regulatory authorities. A law was finally enacted in March 1945, under which supervision and taxation of the insurance business by the individual states is continued. With some exceptions, the application of the federal anti-trust and certain other laws to insurance is suspended until Jan. 1, 1948, but these laws will be in effect thereafter to the extent that such business is not regulated by state laws.

Notwithstanding the passage of this legislation, the question of the validity of the tax laws of certain states growing out of the decision referred to was still open, their validity being questioned on the ground that they discriminate unconstitutionally against foreign (out-of-state) insurance companies and hence against interstate commerce. This was alleged in the case of states which imposed on domestic companies either no tax or a tax at a rate lower than that applicable to foreign companies. The question is being tested by litigation in a number of states. Several states have, however, enacted statutory amendments so that they now impose the same tax rate on domestic and foreign companies.

LEROY A. LINCOLN,
President, Metropolitan Life Insurance Company.

LIME. The lime industry in 1944 experienced remarkably little change compared with 1943, according to the United States Bureau of Mines. Sales of "open-market" lime totaled 6,473,563 short tons valued at \$48,698,162, receding 2 per cent from the all-time high of 1943. Quicklime represented 80 per cent and hydrated lime 20 per cent of the total, the same as in 1943. Sales of agricultural and refractory lime gained slightly, but building lime and that used in the chemical and processing industries experienced small declines. The most difficult problem with most operators was the shortage of labor.

LIMES. See CITRUS FRUITS.

LINDSAY, Sir Ronald Charles, British diplomat; b. Scotland, May 3, 1877; d. Bournemouth, England, Aug. 21, 1945. As British ambassador at Washington from 1930 to 1939, Sir Ronald helped to promote mutual understanding between Britain and the United States which made it easier for these two nations to present a solid front against Fascist aggression.

The fifth son of the 26th Earl of Crawford, Sir Ronald was educated by private tutors and at the Winchester School in Hampshire, then specialized in foreign languages. He entered the diplomatic service in 1898; became an attaché at St. Petersburg (now Leningrad) in 1899; a second secretary to the legation at Teheran, Iran, in 1903; and then served in Washington (1905-07), and Paris (1907-08). In 1908 he was brought back to England for three years' service in the Foreign Office, and then was sent to The Hague, where, among other things, he was secretary to the British representatives at the International Opium Conference in 1911. He became undersecretary of state for finance to the Egyptian government in 1913, a post he held until 1919, when he was dispatched to Washington as counselor to the British Embassy. Appointed minister plenipotentiary at Paris in 1920, he was back in London the next year as additional undersecretary at the Foreign Office, where he remained until

1924, when he went to Constantinople (now Istanbul), first as His Majesty's representative and later as ambassador. He was transferred to Berlin as British ambassador to Germany in 1926 and two years later returned to London as undersecretary of state at the Foreign Office. Not long after becoming British ambassador in Washington, Sir Ronald was engaged in arduous negotiations regarding the payment of the British war debt. He retired from the diplomatic service in 1939. Sir Ronald was knighted in 1925.

LIONS INTERNATIONAL. An international association of Lions Clubs, founded by Melvin Jones; organized in Chicago, June 7, 1917, and devoted to service to humanity. On July 30, 1945 the membership totaled 230,000. Lions Clubs carry on their activities individually. They are classified within the following eight headings: Boys and Girls; Citizenship and Patriotism; Health and Welfare; Safety; Civic Improvement; Community Betterment; Education; Sight Conservation and Blind. The organization publishes *The Lion*, *El Leon*, and *Lions International Monthly Letter*. Ramiro Collazo is president of the association, and Melvin Jones is secretary general: Headquarters: 332 S. Michigan Avenue, Chicago 4, Ill.

MELVIN JONES,
Secretary General, Lions International.

LITERATURE. The year 1945 saw a continuance of the boom times that the publishers had enjoyed through 1944, although persisting paper restrictions were reflected in a *Publishers Weekly* (Oct. 6, 1945) tabulation showing that during the first 9 months of 1945 only 4,747 titles were published, as compared with 5,159 in the same period of the previous year, a decline of 412 titles.

Germany's defeat early in May, ending the war in Europe, brought a slight easement with an increase of paper allotments (2½ per cent) effective July 3, bringing the 1945 quota to 77½ per cent. If the additional allowance was to be used wholly during the last six months of the year, this meant a 5 per cent improvement. An amendment of the order controlling the use of newsprint on August 27, less than a month after V-J Day, limited book publishers to 113.3 per cent of newsprint for books used in the corresponding quarter of 1944, or the second quarter of 1945. At their meeting in Washington early in September the Newsprint Industry Advisory Committee advocated relaxation on October 1 of the War Production Board restrictions, and revocation of all newsprint controls by the end of the year.

While publishers and the book trade in general were optimistic regarding the total sales for 1945's last quarter, there was apprehension over 1946 prospects. Anticipated war aftermaths in the form of large-scale unemployment during the reconversion period and a temporary depression, they feared, would cause a sharp decline in book purchases.

Bookstores reported excellent business for the year, in many cases even better than 1944. As in 1944 a considerable proportion of sales were for shipment to men and women in the services. The return of the expeditionary forces beginning in June and the accelerated demobilization after V-J Day resulted toward the end of the year in a sharp curtailment of these sales.

Among the first fiction titles of 1945 to attain the best seller list were John Steinbeck's

Cannery Row and Samuel Shellabarger's *Captain from Castile*. Lloyd C. Douglas' *The Robe*, published in 1942, continued its phenomenal sale through the year, as did Kathleen Winsor's *Forever Amber*, a holdover from October 1944. Before *Forever Amber*'s English publication, which was delayed until August 31, advance British orders had mounted to the staggering total of 2,500,000 copies. Adria Locke Langley's *A Lion is in the Streets* after May publication leaped to the top of the list where it remained until superseded in August by James Hilton's *So Well Remembered*. The veteran C. S. Forester with his *Captain Hornblower*, Bruce Marshall with *The World, the Flesh and Father Smith* and Wilbur Daniel Steele with *That Girl from Memphis* also became best sellers. Rosamond Lehman's *The Ballad and the Source* and Taylor Caldwell's *The Wide House* likewise took rank. Upton Sinclair's *Dragon Harvest* and Sinclair Lewis' *Cass Timberlane* found their place, as did Lau Shaw's *Rickshaw Boy*, James Ramsey Ullman's *The White Tower* and Thomas B. Costain's *The Black Rose*.

Prominent in nonfiction were Sumner Welles' *An Intelligent American's Guide to Peace*, W. L. White's *Report on the Russians*, the World Publishing Company's *The Best from Yank*, Ernie Pyle's *Brave Men* (November 1944 publication), General Marshall's *Report* and Bill Mauldin's *Up Front*. Significantly, these best sellers were all war books. A good proportion of popular nonfiction, however, had no military connotations, or very incidental ones, as James Thurber's *The Thurber Carnival*, George and Helen Papashvily's *Anything Can Happen*, Gertrude Lawrence's *A Star Danced*, Louis Bromfield's *Pleasant Valley*, Richard Wright's *Black Boy* and Samuel Hopkins Adams' *A. Woolcott*.

The Pulitzer Prize this year for a distinguished novel was awarded to John Hersey for his *A Bell for Adano*; the play award went to Mary Chase for *Harvey*; Stephen Bonsal received the history award for *Unfinished Business*; and Russel Blaine Nye's *George Bancroft: Brahmin Rebel* was adjudged the most outstanding biography. Karl Jay Shapiro received the poetry award for his *V-Letter and Other Poems*.

The Council on Books in Wartime continued after V-J Day the distribution of its Armed Services Editions, consisting of 774 titles in over 20 categories; these included, besides contemporary fiction, biography, history, classics, science, poetry, music and arts, and current affairs. Practically all books issued by American publishers, including the most recent best sellers, have been made available to the series. A monthly production of over 6,000,000 copies was shipped to American fighting men all over the world through 1945. Another function of the council was their Overseas Editions. These were translated into French, Italian and German and distributed by the Office of War Information both in the liberated countries and in occupied enemy territory. While the purpose of the Armed Services Editions was to sustain and improve morale in the fighting forces, the object of the Overseas Editions was frankly propagandist. The books were for distribution to our European civilian allies and defeated enemies. The 72 titles included lives of Franklin, Jefferson, Tom Paine, George Washington Carver and Oliver Wendell Holmes, a history of the United States and a book on the TVA.

On May 7, 1945, Governor Tobin of Massachusetts signed a new censorship bill which had

the backing of the Massachusetts Library Association. It transfers the power to initiate formal action against a book from the police to the attorney general or district attorney, and places complaints under civil rather than criminal procedure. It also limits complaints to sales made to minors. On the very day of the signing, lawyers were still arguing in an appeals court the case of Lillian Smith's banned *Strange Fruit*, continuing litigation begun in April 1944 when a Cambridge book dealer was fined \$100 for selling a copy. The wide publicity given the prosecution of this test case was undoubtedly a factor in keeping the book so long in 1944 at the head of the best seller list. However, the Supreme Judicial Court of Massachusetts upheld the conviction on Sept. 17, 1945, so that in that state the book remains officially banned as obscene.

Fiction.—American men novelists of established reputation produced no work that added appreciably to their laurels during the year. Sinclair Lewis belabored middle class American marriage *à la mode* in *Cass Timberlane*, the story of an elderly husband and a young wife, better told in historic *Main Street*. Upton Sinclair continued the adventures of his Lanny Budd in *Dragon Harvest*. Wilbur Daniel Steele's *That Girl From Memphis* portrayed a repentant Magdalen. John Steinbeck's *Cannery Row* pictured low life in the author's early manner. Herbert Gorman's *The Wine of San Lorenzo* was a fine romance of the Mexican War of 1846. Glenway Westcott's *Apartment in Athens* was a poignant story of a Greek family in occupied Athens. Daniel Wickenden's *The Wayfarers*, a smoothly written tale of Middle Western family life, carried no new message. Booth Tarkington's *Image of Josephine* described the regeneration of a self-fish woman. Charles Nordhoff and James Norman Hall achieved in *The High Barbaree* a fine escapist yarn describing life on a South Sea island unknown to cartographers. John Dos Passos in *First Encounter* revealed the misgivings of a Second World War soldier, fearful that America had lost her ideals and had started on the German path.

A number of lesser known and neophyte fiction writers won honors. Thomas B. Costain, better known in literary circles as an editor than a novelist, produced in *The Black Rose* a romance of 13th century England and the Orient that became a best seller almost on publication. James Ramsey Ullman, an adept at mountaineering, wrote a fascinating psychological novel in *The White Tower* which describes the ascent of an Alpine peak in wartime. Robert Molloy, literary editor of *The New York Sun*, in his first novel *Pride's Way*, produced a minor masterpiece of characterization. Walter Van Tilburg Clark, whose *Ox-Bow Incident* was much admired several years ago, depicted a sensitive musically talented young Nevadan in *The City of Trembling Leaves*. Edison Marshall's *The Upstart* narrated the romance of 18th century London strolling players, with a happy denouement in Georgia of postrevolutionary times. The actor Tom Powers wrote a delightfully humorous and touching romance about a hat check girl in *Virgin With Butterflies*. E. J. Nichols' *Hunky Johnny* depicted second generation Slovak-Americans fighting against the prejudices of our native stock.

Established American women novelists were more productive than in the previous year. Taylor Caldwell's *The Wide House* was sheer melodrama. Edna Ferber set the scene of *Great Son* in the booming Pacific Northwest, while Faith

Baldwin, tiring of Manhattan sophisticates, found humanity equally perverse in *Arizona Star*. Alice Tisdale Hobart crossed the Rio Grande to interpret revolutionary Mexico of recent decades in *The Peacock Sheds His Tail*. Another old China hand, Pearl Buck, stayed home to describe life in the Pennsylvania countryside in *Portrait of a Marriage*. Elswyth Thane's *Ever After* carried the Day family saga a generation further, into the gay nineties. Elizabeth Ogilvie in *Storm Tide* wrote of social conflicts on the Maine coast. Mary Roberts Rinehart's first book in three years, *The Yellow Room*, also with a Maine setting, was a sure best seller after serialization in the *Saturday Evening Post*. Susan Glaspell's *Judd Rankin's Daughter* was a thoughtful, rather wistful tale of a wise old middlewestern newspaper editor and his battle-scarred grandson.

Several newcomers and little known American women authors established reputations as successful fiction writers this year. A first novel, and the most popular, was Adria Locke Langley's *A Lion is in the Streets*, describing a Southern demagogue's transformation into a local dictator. For inexplicable reasons many reviewers attempted to prove that the scallawag hero was not based upon the late Huey Long of malodorous memory. Josephine Pinckney's *Three O'Clock Dinner* was Charlestonian high comedy by a native better known as poet than novelist. Martha Dodd's *Sowing the Wind* depicted the *facilis descensus* of a young German imbued with the late A. Hitler's doctrine. Elizabeth Janeway's *Daisy Kenyon*, a second novel, described the love "without benefit" of a career woman and a lawyer. Christine Noble Govan in *Jennifer's House* described the gentle life of the old South.

Foreign novelists, as in 1944, were well represented. James Hilton's *So Well Remembered*, a nostalgic story of small town life, soon became the leading best seller. Mary Lavin's *The House in Clewe Street* was an interesting study of life in an Irish village. E. L. Voynich (an Englishwoman who in 1897 published *The Gadfly*, a novel of the risorgimento that became a best seller) again showed her mastery of characterization in *Put Off Thy Shoes*, a psychological novel of the 18th century. George Simenon's *The Shadow Falls* plumbed the pathologic depths of a French family. Rosamond Lehman's *The Ballad and the Source* was a study of a beautiful woman who preferred evil. Ernest Boyd's translation of Heinrich Mann's *Little Superman*, revealed the basic savagery and servility of German character. Robert Graves' *Hercules, My Shipmate* was a colorful account of Jason and the Argonauts in pursuit of the Golden Fleece; it is one of the best of his evocations of classic epochs. Clemence Dane's *He Brings Great News* describes the adventures of the young officer who brought the news of the Trafalgar victory to London. Lau Shaw's *The Rickshaw Boy* was a racy, humorous and ironically pathetic story of a Chinese underdog. Zalman Shneour's *Song of the Dnieper* tells of the persecutions of heroic Jews in a Czarist village. M. B. S. Storde-Jackson's *Tansy Taniard* was a romance of Elizabethan England. Nicholas Monsarrat's *Leave Cancelled* described the amorous farewell of a British soldier returning to the front. André Maurois' *Woman Without Love* was a brilliant psychological study of a frustrated woman. Compton Mackenzie's *The North Wind of Love* told the impact of prewar world events on a sensitive Englishman. Johannes V. Jensen, the Dane who received the Nobel Prize for literature in 1944, was represented by

his greatest work, *The Long Journey*, an epic of mankind. C. S. Forester's *Captain Hornblower* was a swashbuckling yarn in the Marryat tradition. Bruce Marshall repeated his feat of *Father Malachy's Miracle* in *The World, the Flesh and Father Smith*. W. P. Crozier, for 20 years editor of the Manchester *Guardian*, died just before publication of his novel of imperial Rome, *The Fates Are Laughing*. The Hungarian Ferenc Molnar's first novel with an American setting, *Farewell My Heart*, was a trivial production. Rafael Sabatini's *Birth of Mischief* was an ineffective historical romance dealing with the rise of Prussia under Frederick the Great. J. B. Priestley's *Three Men in New Suits* described the reactions of demobilized soldiers to a changed England. Josephina Niggli delightfully portrayed her rural compatriots in *Mexican Village*. Ludwig Bemelmans' *The Blue Danube*, with his own colored illustrations, was a tender, witty and deeply moving story by this popular Austrian humorist. Jules Romains' *The Wind is Rising*, the 12th volume of his *Men of Good Will*, carried the story to 1928 when most of the characters had turned forty.

Biography, Memoirs.—There was a large variety of biographies and reminiscences of statesmen, soldiers, scholars, writers and artists, the biographical subjects being in the main of 19th century and contemporary personalities. George Santayana scored with *The Middle Span*, a continuation of *Persons and Places*, which carries the reader through the long Harvard years with bright interludes of European travel. Dorothy Caruso's *Enrico Caruso: His Life and Death* was a tender and deeply moving portrait of a great artist with the golden heart of a child. As fine and poignant a tribute to a life partner was Henry Wise Miller's *All Our Lives: Alice Duer Miller*. Samuel Hopkins Adams' *A Woolcott: His Life and His World* was a penetrating analysis that infuriated some of Woolcott's friends. Senator George W. Norris' *Fighting Liberal*, published a few months after his death, was the unemotional apologia of a reformer. Tikhon Polner's *Tolstoy and His Wife* described at first hand a ménage more fabulous than fiction. Edgcomb Pinchon's *Dan Sickles* attempted to rehabilitate as thorough a scoundrel as has ever risen to high place in American public life. Carl Van Doren provided an excellent likeness in *Carl Van Doren*. The South African Stuart Cloete depicted Cecil Rhodes, Paul Kruger and Lobengula, last king of the Matabele, in *Against These Three*.

Among the biographies of 18th and early 19th century personalities one of the best was Claude Bowers' *The Young Jefferson*, recreating the statesman's early years. Joseph Wood Krutch's admirable *Samuel Johnson* stimulated many readers to reperusal of their Boswells. Adolph Meyer's *Voltaire: Man of Justice* was a good brief study of the man who, according to John Morley, was one of the underlying forces that have shaped the course of civilization. Ricardo Rojas' *San Martín*, excellently translated by Herschel Brickell and Carlos Videla, was a spirited life of the great Argentine soldier who ranks in moral grandeur with Washington. W. E. Woodward portrayed in *Tom Paine*, the first Anglo-American champion of the common man. Phil Stong's *Marta of Muscovy* presented Peter the Great's colorful second wife. Eliot M. Grant described *The Career of Victor Hugo*. Daniel Sargent's *Mitri* depicted Prince Demetrius Galitzin who, as a missionary priest of the Roman

Catholic Church, founded Loretto, Pa. Robert Haven Schauffler's *Florestan* was a vivid portrayal of the composer Robert Schumann. Evelyn Foster Mornewick in *Chronicles of Stephen Foster's Family* told nothing new about Stephen. John Moody's *John Henry Newman* pictured the famous convert.

Lives and memoirs of personalities that flourished in more recent and contemporary times included Linnie Marsh Wolfe's *Son of the Wilderness*, a fine portrait of John Muir; Field Marshal Viscount Wavell's *Allenby in Egypt*, a history of the Allenby administration after the First World War; Theodore Maynard's *Too Small a World*, a charming life of the little Italian nun who came to New York before the turn of the century, and who will probably be canonized, becoming the first saint to die in the United States. The Danish Karl Eskelund's *My Chinese Wife* joyously refuted Kipling's aphorism as to the incompatibility of East and West. Oliver La Farge in *Raw Material* told how he overcame the handicap of Groton and Harvard. J. Frank Dobie waxed lyrical over the English countryside in *A Texan in England*. Among other entertaining reminiscences were Henry Seidel Canby's *Family History*, narrating Canby exploits in three centuries; Charles Hanson Towne's *So Far So Good*, recalling New York events and personalities of the nineties and early decades of this century; Gertrude Lawrence's *A Star Danced*, a better than average theatrical autobiography; Louis Bromfield's *Pleasant Valley*, describing a Gallophil's escape from the dangers and sufferings of France to a co-operative farming venture in the Ohio hill country; the late Alexander Granach's *There Goes an Actor* was the colorful life story of a popular Jewish actor. Robert Service, the Scot who became Canada's national poet, narrated his career in *Ploughman of the Moon*. Margery Miller, pretty young college graduate and fustian cultist, did her bit for good race relations in *Joe Louis: American*. Frank McNaughton and Walter Hehmyer produced a competent, and the first, biography of our president entitled *This Man Truman*.

History, Government and Economics.—The American historical background was covered in colorful variety. Volume II of the *Album of American History, 1783-1853*, of which James Truslow Adams is editor in chief, was a picture book containing 1,300 representations of the American way of life during seven decades. Stephen Bonsal's *When the French Were Here* described the friendly invasion of 1780 with its glorious climax at Yorktown. James Monaghan's *Diplomat in Carpet Slippers* revealed Lincoln's brilliant foreign policy. One new edition of a classic deserving special mention was Alexis de Tocqueville's *Democracy in America*, corrected and annotated by Phillips Bradley. Arthur M. Schlesinger Jr.'s *The Age of Jackson* described a famous era. H. McD. Clokie's *Canadian Government and Politics* illuminated Canadian obscurities. Sir John Clapham's *The Bank of England* gave a full length biography of the Old Lady of Threadneedle Street from her 1694 birthday to 1944. Another institutional history of note was *United States Naval Academy* by John Crane and James F. Kieley, recording a century's progress. Prof. Bernard H. M. Vlekke's *Evolution of the Dutch Nation* narrated the growth of democracy on the Zuyder Zee, while his *Story of the Dutch East Indies* pictured the development of the Netherlands Indies down to General MacArthur's return to the Philippines. Arthur Bryant

in *Years of Victory: 1802-1812*, sequel to his *The Years of Endurance*, continued the story of Britain's quarter century struggle with Napoleon. James Truslow Adams' *Big Business in Democracy* was a panegyric of big business as exemplified in the history of General Motors. A well reasoned argument for continuance of the free enterprise system appeared in George Terborgh's *The Bogy of Economic Maturity*. John Bartlet Brebner analysed the interdependence of the chief English-speaking nations in *North Atlantic Triangle: The Interplay of Canada, the United States and Great Britain*. Charles A. Beard in *The Economic Basis of Politics* contended that only "economic man" can balance the trend toward statism. *Economic Problems of Latin America*, edited by Seymour E. Harrison, was one of the best available studies of the economies of the ten leading Latin American countries by 17 economists. P. T. Ellsworth's *Chile: A New Economy in Transition* presented a plan for stabilizing that nation's unbalanced economy.

The War, World Affairs.—There was no diminution in the flood of books about the war. Certainly the most important was *General Marshall's Report—The Winning of the War in Europe and the Pacific*, the chief of staff's account of the American Army's activities from July 1, 1943 to June 30, 1945; actually it continues to the defeat of Japan six weeks later. This cogent history of the American military contribution to the Axis débâcle is a must for students of the Second World War. Joel Sayre's *Persian Gulf Command* described the task of 30,000 American service troops in supplying Russia through the Iran corridor with the 4½ million long tons of munitions that helped to stop the German stampede before Stalingrad. Robert J. Casey's *This is Where I Came In* and *Battle Below* gave a brilliant correspondent's views of five years of warfare in Europe. Ira Wolfert's *American Guerrilla in the Philippines* was the epochal story of Lieut. I. D. Richardson's exploits in the Japanese-held islands. Louise Reid Spencer's *Guerrilla Wife* pictured life in the Philippine bush while her husband fought the invaders. No survey of war literature could be complete without reference to *The Best from Yank*, an anthology of the GI's point of view, and Bill Mauldin's *Up Front* that established its author as the greatest war cartoonist of combat soldiers. One of the best of several naval books was Lieut. Comdr. Joseph Bryan's and Philip Reed's *Mission Beyond Darkness*, describing a strike by Admiral Mitscher's Task Force 58 against a Japanese fleet in the Philippines. *Men Under Stress* was a distinguished study of operational fatigue by Lieut. Col. Roy R. Grinker, M.C., and Major John P. Spiegel, M.C.

British fighting men were well represented. Guy Morgan's *P.O.W.* was a penetrating analysis of the psychological effects of prison life on war prisoners. Lieut. L. A. Jewell's *Secret Mission Submarine* narrated the odyssey of the English pig boat that conveyed our Gen. Mark Clark to his clandestine rendezvous in North Africa and then, on a similar perilous voyage, transported General Giraud across the Mediterranean. Capt. Somerset de Chair's *The Golden Carpet* was a somewhat too egotistic account of the brilliant exploit of the British armored battalion that captured Baghdad in May 1941. The Swedish Count Folke Bernadotte's *The Curtain Falls* described Himmler's attempt to make a negotiated peace.

There were a number of interesting books on what to do with the Germans to safeguard the world against a repetition of their aggressions. Henry Morgenthau, Jr.'s *Germany is our Problem* urged depriving Germany of all her heavy industries and sending the excess industrial workers back to the land. A like solution was offered by Col. T. H. Minshall in *Future Germany*, originally published in England in 1944; Minshall argued also for political and administrative decentralization of the Reich, suggesting that the Germans were a far happier people when they had a lower standard of living. Lord Vansittart's *Bones of Contention* arraigned the German ruling classes and called attention to the fact that many of the German fugitives from Hitlerism in England and the United States still profess the Pan-German faith. The intransigent Heinrich Hauser's *The German Talks Back* expresses what is, perhaps, the average Teuton's conviction that 20 years hence Germany will revenge her two defeats in this century. Erich Koch-Weser in *Hitler and Beyond*, published after the author's death, attempted to prove that there are good Germans "who didn't want the war." Emil Ludwig's *The Moral Conquest of Germany* offered a plan for civilizing the Germans.

Prominent in numbers and quality were the books that attempted to forecast Russia's power politics moves. Edgar Snow's *The Pattern of Soviet Power* was an objective study of ambitions for European domination. John Scott's *Europe in Revolution* favored a European federation, but thought it unfeasible because of Russian opposition. David J. Dallin in *The Big Three: the United States, Britain and Russia* offered a pessimistic appraisal of problems that must be solved to avoid a third world war waged to satisfy Russian imperialist ambitions.

There were a number of excellent studies of Japanese mentality and ambitions. Otto D. Tolischus' *Through Japanese Eyes* described the concepts of a "master race." *Japanese Militarism* by John M. Mari, a scholarly young Nisei, was a penetrating historical analysis of Japanese thought patterns. Willard Price in *Japan and the Son of Heaven* urged the removal of Hirohito as essential to future peace.

Nathaniel Peffer's *America's Place in the World* argued for a world security organization, the only possible instrument to ensure peace. Sir William Beveridge's *The Price of Peace* was logically related to his former books on social security and full employment. Roland Hall Sharp's *South America Uncensored* described the Fascist tidal wave that swept over South America when Hitler and Mussolini were sinking. Don Luigi Sturzo in *Italy and the Coming World* advocated gradual measures for solving Italy's problems.

Poetry.—One of the sensational literary events of the year was the publication of 668 hitherto unpublished poems of Emily Dickinson entitled *Bolts of Melody*. John Crowe Ransom's *Selected Poems* earned high commendation. Louis MacNeice's *Springboard (Poems)*, 1941-44 reflected war-wracked England. *The Collected Poetry of W. H. Auden* contained most of the earlier work between boards and two dozen uncollected poems. The brilliant young Karl Shapiro, whose *V-Letter* brought him sudden fame, produced in his blank verse *Essay on Rime* a fine appraisal of modern poetry. Ogden Nash's *Many Long Years Ago* contained representative pieces of this master of whimsical verse.

Miscellaneous.—H. L. Mencken's monumental *The American Language: Supplement I* was a thesaurus of expressions that have found a place in American English. Less ambitiously a Scotch philologist, Ivor Brown, in *A Word in Your Ear and Just Another Word* gave a choice selection of British archaisms and contemporary slang. Another study in nomenclature was George R. Stewart's *Names on the Land* describing the origin of American place names.

Among outstanding books on philosophy Bertrand Russell's *A History of Western Philosophy*, readable as Will Durant's *Story of Philosophy*, explained the ideas of the great philosophers from the Greeks to Bergson and Dewey. Aldous Huxley's *The Perennial Philosophy* was a stimulating anthology of Western thought. The distinguished Harvard thinker Ralph Barton Perry explained his concepts in *One World in the Making*.

Social problems were treated in Henry A. Wallace's *Sixty Million Jobs*, berated as a visionary's Utopia and lauded as a brilliant solution of the major postwar problem; and Wallace Stegner's *One Nation* which discussed the intolerance and prejudice suffered by eight considerable American minority groups: Jews, Catholics, Chinese, American Indians, Mexicans, Japanese, Filipinos and Negroes. It is extremely doubtful that Roman Catholics and American Indians will agree that they are being discriminated against by their fellow-Americans.

A number of books were evoked by the bombs that "fell" on Japan. Henry de Wolf Smyth's *Atomic Energy for Military Purposes* brilliantly traced the history of the discovery, while John J. O'Neill in *Almighty Atom* described the probable effect on our civilization of the release of this new force.

Marshall Field's *Freedom is More than a Word* describes the multimillionaire publisher's struggles against news monopolies to establish his New York and Chicago dailies. The New York Times staff collaborated in producing *The Newspaper: Its Making and Meaning*, a book devoid of political implications.

Collections and anthologies were numerous. The *O. Henry Memorial Award Prize Stories of 1945*, edited by Herschel Brickell, contained 22 stories of which 10 depended on the war for motivation. John T. Flanagan's *America Is West: An Anthology of Middle Western Life and Literature*, though a good introduction to midwestern literature, suffered from a lack of humorous selections. H. Allen Smith's *Desert Island Decameron* was a first rate humor collection. Caroline Gordon's *The Forest of the South* was a fine collection of her tales of the southland. Bennett Cerf edited a varied and creditable collection entitled *American Short Stories*; most of the humorous tales grouped in his *Laughing Stock* had seen previous publication in one of his earlier anthologies.

The outstanding photograph album was Andreas Feininger's *New York*, including 96 full page pictures with preface by John Erskine—the most distinguished collection of views of Manhattan's cyclopean structures and typical street scenes that has yet appeared between boards.

There were a number of choice cartoon collections, notably Gardner Rea's *Sideshow* and the Russian Mischa Richter's *This One's on Me*.

The death of Theodore Dreiser on December 28 evoked considerable comment. The son of German immigrants, ancestral voices spoke

through his realistic novels which struck a new note in American fiction.

LITHUANIA. A Baltic state south of Latvia. The country was admitted into the Soviet Union as the Lithuanian Soviet Socialist Republic on Aug. 3, 1940, but that status has not been recognized by the United States and British governments. The Lithuanian republic recognized by Soviet Russia on July 12, 1920, had an area of 40,385 square miles; forcible seizure by Poland of Vilnius and surrounding territory (19,995 square miles) on Oct. 9, 1920, was accepted as a *fait accompli* by the Conference of Ambassadors on March 15, 1923; and on March 22, 1939, Germany forced Lithuania to yield Klaipeda, or Memel, and surrounding territory (975 square miles). With reconquest of the country by Russian troops in 1944, the original boundaries were restored, Vilnius (Vilna), population 1939, 207,750, becoming the capital. The population of Lithuania, as estimated on July 1, 1941, was 3,134,070. Prior to reabsorption of Vilnius, the capital was Kaunas (Kovno), which had a population in 1939 of 152,365; other cities include Siauliai (Shavli), 31,299, and Panevezys (Ponevezh), 26,508.

Lithuania is essentially an agricultural country the soil claiming 76.7 per cent of the people. Over 49 per cent of the land is arable; 22.2 per cent forests; and 16.4 per cent unproductive. The chief crops are rye, wheat, barley, oats, potatoes, and flax. The principal exports are meat, butter, eggs, flax, and wood pulp. Under prewar conditions Great Britain was Lithuania's principal customer, taking nearly 40 per cent of her products and supplying about one third of her imports.

The German defenders of Memel had been isolated in October 1944, and with its capture on Jan. 28, 1945, by Russian forces the seaport resumed its earlier name of Klaipeda and once more became part of Lithuania. By this time the Lithuanian SSR had been reconstituted, with Justas Paleckis as chairman of the presidium (president). However, Acting Secretary of State Joseph C. Grew stated on March 3, 1945, that there had been no change in the attitude of the United States toward Lithuania and the two other Baltic states, Estonia and Latvia, and that their ministers in Washington were still accredited and recognized; and the United States Treasury announced on March 25 that in appropriate cases, it would grant licenses to American creditors for payments from frozen funds belonging to Lithuania and certain other countries. This American policy of nonrecognition of Soviet claims to the Baltic states was further emphasized on Oct. 6, 1945, by Supreme Court Justice Robert H. Jackson who, as United States prosecutor of German war criminals, wrote to the Russian, British, and French prosecutors on the War Crimes Commission that, in signing the indictment preparatory to the trials he had "no authority either to admit or to challenge, on behalf of the United States, the Soviet claims to sovereignty over" Lithuania, Estonia, Latvia, and certain other territories to which reference had been made in the indictment as being within the area of the USSR.

The Germans had wrought great destruction during their occupation of Lithuania, according to Soviet sources damage done being estimated at 17 billion rubles and 300,000 civilians having been killed. Much of the population had been lost to the country, too, from other causes. Large numbers had been removed into Germany by the Nazis to work as slave laborers, and others fled the country when it was reoccupied by the Russians in 1944, a few making their way to Sweden but the bulk escaping westward to seek protection from the advancing Anglo-American forces. Many of the Lithuanians and other Balts remaining in Germany during 1945 were reluctant to return home, swelling the large numbers of stateless displaced persons. Poland and Lithuania agreed mutually to resettle Polish and Lithuanian minorities desiring to return to their countries of origin, but such transfer would not be obligatory; those wishing to move were to be allowed to take their belongings, and at their destinations would be aided in re-establishing themselves.

The budget for 1945 estimated revenue to amount to 728,000,000 rubles. One third of government expenditure was allocated to the rehabilitation of industry and the economy of cities and villages; nearly one half was devoted to cultural measures and the improvement of living conditions, and approximately one fourth went to public education and the development of the sciences and arts. The state extended to the peasants credits totaling 20,000,000 rubles; and 75,000 peasants were given each 15.5 hectares of land (1 hectare = 2.471 acres) free of charge and without limitation of time. In 1945, seven technical schools were opened to give training in agricultural science.

LLOYD GEORGE, David (1ST EARL LLOYD GEORGE OF DŴYFOR), British statesman: b. Chorlton-on-Medlock, Manchester, England, Jan. 17, 1863; d. Ty Newydd, Llanystumdwy, Caernarvonshire, Wales, March 26, 1945. One of the most important figures in British and European history during the first quarter of the 20th century, Lloyd George served as prime minister of Great Britain and Ireland during the crucial years of the First World War, directed Britain's policies to victory, and played a major role at the Paris Peace Conference and in drawing up the Treaty of Versailles.

The son of a poor schoolmaster and farmer, Lloyd George was brought up in Wales, where his uncle, a shoemaker and pastor of the Campbellite Baptists, educated him for the law. Having passed his law preliminary, he was articled to a firm of Portmadoc solicitors at the age of 17, and in 1884 qualified as a solicitor himself. His local reputation was made in 1888 by a successful fight, carried to the High Court, in defense of the right of a Nonconformist to burial in the churchyard of a Church of England parish. In the same year, he was married to Margaret Owen of Mynyddednyfed Fawr, Criccieth, and was adopted as Liberal candidate for Caernarvon Boroughs. The following year he was chosen an alderman, and in 1890 he was returned at a bye-election to the British House of Commons. An impassioned advocate of Welsh home rule, he won recognition in Parliament by his brilliancy in debate, and came into national prominence

through his pacifist speeches in opposition to the Boer War in 1899.

On the accession of the Liberals to power in 1905, Lloyd George became president of the Board of Trade, and with the elevation of Herbert Henry Asquith to the premiership in 1908, he was promoted to chancellor of the exchequer. The celebrated People's Budget, which he introduced in 1909, provided for heavy increases on income and inheritance taxes, levies on unearned income, and heavy rates on monopolies, and unearned increments of land. The House of Lords vetoed the budget, and the Liberals, denouncing this action as a breach of the constitution, called a general election in January 1910 to decide the issue. The Liberal government was returned to power, and the Parliament Bill, depriving the House of Lords of the right to veto, was passed in 1911. In that same year, Lloyd George introduced the National Insurance Bill, providing for health and unemployment insurance.

With the outbreak of the First World War, Lloyd George, as war finance minister, took prompt and wise measures to insure and maintain financial stability. When the Liberal government was broken up in May 1915, he accepted the newly-created post of minister of munitions in the Liberal-Conservative coalition administration of Asquith and Andrew Bonar Law. Under his direction, the munitions industries were quickly mobilized and a network of arsenals soon covered the country. Late in 1915, he forced to a head the movement for compulsory military service and swung the Cabinet over to his point of view, despite Liberal sentiment against conscription. On July 7, 1916, he succeeded Lord Kitchener as secretary of state for war. However, he became increasingly dissatisfied with Asquith's conduct of the war, and on Dec. 1, 1916, under threat of resignation, he urged that the direction of the war be placed in the absolute control of a small war committee, and that Asquith should not be a member. As the Conservative leaders supported Lloyd George, Asquith resigned on December 4, and shortly thereafter Lloyd George became prime minister and first lord of the treasury.

With virtually dictatorial powers, he immediately appointed a small coalition war committee, which resulted in a general quickening of war decisions and a more decisive control of the whole machinery of government. Lloyd George's faith in victory, his driving force and dauntless courage, and his ability to keep the confidence of the British public, even in the darkest moments of the war, proved invaluable to the Allied cause. During the supreme crisis arising from the great German offensive in the spring of 1918, he appealed to President Woodrow Wilson to send all available American troops at once, and was finally able to persuade British generals to accept the unified command of the Allied armies under Marshal Ferdinand Foch. This contributed greatly to the Allied successes that marked the autumn of 1918, culminating in the collapse of German resistance in November.

Deeply committed to a policy of vengeance against Germany by the overwhelming victory of his coalition government in the general elections of Dec. 14, 1918, Lloyd George attended the Paris Peace Conference in 1919 as the principal British delegate and later served as a member of the Council of Four. Although he supported the idea of the League of Nations and was more or less disposed to make a moderate peace, ruthless demands on Germany from the home front ham-

pered his freedom of action and weakened his resistance to the militant policies of French Premier Georges Clemenceau.

During the next year he developed extensive plans for social reform, but these had to be scrapped in answer to the general demand for government economy, which weakened his radical support. But the two chief factors contributing to the downfall of the coalition government were Lloyd George's alienation of the Unionist wing of the Conservatives by arranging a series of negotiations with the Sinn Fein leaders in 1921, which resulted in the establishment of the Irish Free State; and his support of the Greeks in the Greco-Turkish War, which almost involved Britain in a war with Turkey. The Conservatives decided to withdraw support from the coalition on Oct. 19, 1922, and the Lloyd George ministry at once resigned.

In 1923, he reunited his followers with the Asquith Liberals, and two years later, when Asquith was elevated to the peerage, Lloyd George became the official leader of the Liberal Party. However, by this time the party had fallen considerably from the important position it had once occupied. He permanently broke with the party in 1931 by refusing to support Ramsay MacDonald's election platform. After 54 years of service as a member of Parliament, he announced on Dec. 28, 1944, that he would retire when his term expired; three days later, in King George's New Year's honors list, he received an earldom. Lloyd George's wife died in 1941, and two years later, he was married to the former Frances Louise Stevenson, who had been his secretary for 30 years.

Lloyd George was the author of *Is It Peace?* (1923); *The Truth about Reparations and War-Debts* (1932); *War Memoirs* (1933-36); *Organized Prosperity* (1935); and *The Truth about the Peace Treaty* (1938).

LONDON CONFERENCE. See WORLD POLITICS.

LOUISIADE. See PAPUA, TERRITORY OF.

LOUISIANA. West South Central state, United States; admitted to the Union April 8, 1812. Population (1940): rural, 1,383,441; urban, 980,439; total, 2,363,880. Land area, 45,177 square miles, divided into 64 parishes. Principal cities, with 1940 populations: New Orleans, 494,537; Shreveport, 98,167; Baton Rouge, the capital, 34,719; Monroe, 28,309; Alexandria, 27,066; Lake Charles, 21,207.

Chief State Officers, 1945.—Governor, J. H. Davis; lieutenant governor, J. E. Verret; secretary of state, W. O. Martin, Jr.; treasurer, A. P. Tugwell; attorney general, F. J. Le Blanc.

Judiciary.—Chief justice of Louisiana's Supreme Court, Charles A. O'Neil; associate justices, J. B. Fournet, Lee Pouder, A. T. Higgins, Joe B. Hamiter, Wynne B. Rogers, Frank W. Hawthorne.

Legislature.—The state legislature (Senate, 39 members; House of Representatives, 100) convenes biennially.

Education.—Public elementary schools (1943-44 school year, latest reported), 2,460; teachers, 10,891; pupils, 342,469; average yearly salary of white elementary school teachers, \$1,527; of Negro teachers, \$756. Public high schools, 565; teachers, 4,242; students, 90,021; average yearly salary of white high school teachers, \$1,839; of Negro teachers, \$1,136. Education is compulsory for children between the ages of 7 and 15, inclusive. There are 7 teacher training or normal schools in the state, one of them for Negroes. All receive financial aid from the state.

Finances.—Following is a statement of Louisiana's finances for the fiscal year 1944-45, supplied by J. H. Lester, state budget officer:

Balance in treasury, beginning of fiscal year 1944-45	\$ 39,706,420.17
Receipts, 1944-45	121,993,955.25
Total	\$161,700,375.42
Disbursements, 1944-45	120,052,625.49
Balance, beginning of fiscal year 1945-46	\$ 41,647,749.93

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.).....	23,297	18,870	23,400
Oats (1,000 bu.).....	2,103	4,880	5,015
Rice (1,000 bu.).....	20,214	22,160	23,166
Cotton (1,000 bales) ..	643	620	420
Hay:			
Tame (1,000 tons) ..	356	362	406
Pecans (1,000 lb.) ..	7,788	14,400	9,600
Peanuts (1,000 lb.) ..	5,094	2,480	2,400
Sweet potatoes (1,000 bu.)	7,352	8,100	10,472
Tobacco (1,000 lb.) ..	141	210	165
Potatoes (1,000 bu.) ..	2,676	3,498	3,009
Peaches (1,000 bu.) ..	298	390	422
Pears (1,000 bu.)	163	245	228

LUGARD, Frederick John Dealtry, 1st BARON, British colonial administrator: b. Jan. 22, 1858; d. Abinger Common, Surrey, April 11, 1945. Almost all of his long career was identified with tropical Africa, where, besides accomplishing much exploration, he was a pioneer in political theory and colonial policy. In 1878 he received an army commission, having previously attended Rossall School, in Lancashire, and the Royal Military College, at Sandhurst. He served through the Afghan War, 1879-80, and the campaigns in the Sudan, 1884-85, and Burma, 1886-87, and in 1888 went to Africa to lead an expedition against Arab slave traders in Nyasaland; this was five years before establishment of the British protectorate over that country, which was still almost entirely unmapped. In April 1889 he entered the service of the Imperial British East Africa Company, which held a charter for the development of what later became Kenya Colony and the Uganda Protectorate. He explored the region of the Sabaki River, planned emancipation of the slaves in mainland territory of the sultan of Zanzibar (which ultimately constituted the Kenya Protectorate), and crossed Lake Victoria into Uganda; there he settled disputes between followers of rival missionary bodies which had led to open warfare, mapped much of the region around Lake Albert Edward, and established peaceful conditions for future trade in what became one of the most prosperous British territories in Africa. Returning to Britain in 1892, he persuaded the Liberal government to abandon its announced intention of relinquishing the dominant position in Uganda which he had secured for his country in competition against French plans; and the following year he published *The Rise of Our East African Empire*, in part autobiographical, in which he outlined a system for Uganda permitting internal control to be exercised through the native chiefs. This theory of "indirect rule" he was shortly to be able to demonstrate in practice in West Africa, destined to be the scene of his greatest work as colonial administrator.

In 1894 he joined the Royal Niger Company, chartered to develop the future colony and protectorate of Nigeria, and was sent to Bornu,

where the British, Germans, and French were competing to establish spheres of influence. Here, in a region little known to white men, he persuaded native rulers to accept the suzerainty of Britain in preference to that of its rivals, and for these services he was created Commander of the Order of the Bath (C.B.). During 1896-97 he explored the Lake Ngami area of the Bechuanaland Protectorate, in South Africa, on behalf of the British West Charterland Company, and then was recalled to West Africa by the British government. With a view to checking further French penetration of the interior districts, he created a native military organization which later became the Royal West African Frontier Force, and commanded it with the rank of brigadier general. In January 1900, the Colonial Office having taken over from the Royal Niger Company all political rights in Northern Nigeria, Lugard was appointed high commissioner for the new protectorate. Here he found circumstances specially favorable for adoption of the system of indirect rule, under which able native chiefs exercised considerable administrative powers. For the most part his paramount authority was acknowledged by the people, and so successful was he in securing the co-operation of the Nigerians that in 1901 he was created Knight Commander of the Order of Saint Michael and Saint George (K.C.M.G.). During 1903, however, Sir Frederick Lugard was involved in a campaign against the emir of Kano and the sultan of Sokoto, influential Mohammedans unwilling to surrender their complete independence, but after the submission of their states the entire protectorate was brought under British control. He resigned the commissionership in 1906, and the following year he was made governor of Hong Kong; he continued to serve there until 1911.

Again called back to West Africa, in March 1912 he was appointed governor of both Southern and Northern Nigeria, still distinct administrations, with instructions to plan their amalgamation; and when this was effected in January 1914, he became governor general. He continued to head the Nigerian government through the four years of the First World War, and at its conclusion he retired. In 1920 he was admitted to the Privy Council (an honorary appointment without responsibilities), and two years later he became a member of the permanent mandates commission of the League of Nations; he took an active part in the work of this latter body for the next 14 years. In his work *The Dual Mandate in British Tropical Africa* (1922; 4th ed. 1929), he outlined the two-fold trust imposed upon colonial administrators—responsibility, firstly, for the welfare of the native inhabitants, and, secondly, development of the country for the good of all; this concept of a "dual mandate" he put into successful practice in Nigeria. He believed that colonial administration should be founded upon native institutions, for these are, in themselves, valuable agencies of government, and their development could lead to some new type of self-governing organization which, while essentially African, guaranteed the individual rights upon which democratic institutions are based. After he was raised to the peerage in 1928, Lord Lugard spoke frequently in the House of Lords on colonial matters, concerning which he was an acknowledged authority. In many parts of Africa, in the course of his lifetime, he had seen slavery abolished, systems of communication

opening up the interior, and welfare measures brought to people in the most distant villages; and he saw, too, his doctrine of the "dual mandate" become the touchstone of British colonial policy.

LUMBER. During the early months of 1945, lumber continued among the most critically needed war materials. As hostilities ended in Europe and the nation's war effort was concentrated against the Japanese, war requirements mounted. Packaging, boxing and crating vast quantities of military supplies and equipment for shipment to the Pacific war theater, and establishment of bases and facilities in the newly won areas, called for an even greater volume of lumber than in the preceding months. The army classed lumber "on a par with ammunition as a combat material."

With production running behind requirements, the War Production Board placed lumbering on the "national production urgency list" in April and tightened controls on distributors' inventories and on the use of low grade lumber of certain species.

With the Japanese surrender, military requirements eased, and most of the government control orders on lumber distribution were lifted. Reconversion needs and pent-up civilian demand were expected to take up the slack resulting from cut-backs in military programs.

At the end of the war, however, lumber stocks were down to less than 4 billion board feet, compared with a prewar stockpile of some 18 billion feet. This meant that much of the production in the months following the war would have to go into replenishing stocks in the hands of distributors before a normal flow of lumber for civilian consumption could be re-established.

Production.—Lumber production in the United States in 1944 totaled 32,553,901,000 board feet, according to estimates made by the Forest Service in co-operation with regional lumber manufacturers' associations. A tabulation by states and species is given below. Production in 1944 showed a decrease of 6.4 per cent compared with 1943. Man-power shortages in the woods and at mills, and shortages of equipment were principal factors contributing to the decline. The progressive deterioration in the man-power situation is indicated by the Bureau of Labor index (1939 = 100) of employment of wage earners in logging camps and sawmills. It showed an average monthly index of 105.9 for the first quarter of 1942; 91.2 for the corresponding period of 1943; 81.6 for the first quarter of 1944; and 75.9 for the first quarter of 1945.

The total number of persons employed in sawtimber logging and mills in the first quarter of 1945 was 433,000. About 17,000 of these were women.

For the first six months of 1945, estimated lumber production was 10.3 per cent less than for the first half of 1944.

Long-Range Situation.—The 1920-40 average of annual lumber consumption in the United States was slightly under 30 billion board feet. It is likely that annual demand will be above this figure for several years after the war. Wood requirements for pulp and paper are also expected to remain at high levels materially exceeding pre-war consumption rates.

Latest estimates of the rate of timber growth in American forests were made in 1938. At that time the total annual growth was estimated at

11.3 billion cubic feet. Losses from fire, insects, diseases, etc., reduced this to a net usable increment of 9.2 billion cubic feet, including both merchantable material and small timber. The volume of logs and cordwood cut for all purposes was estimated at 11.4 billion cubic feet. Timber cut thus exceeded net usable increment by 2.2 billion cubic feet. In trees large enough to yield sawlogs, the net usable increment was 26.7 billion board feet; the volume cut was 42.4 billion board feet—more than 50 per cent in excess of growth.

While the annual net increment is not likely to have changed much since 1938, the drain is now substantially larger. Annual lumber cut in the past few years has been some 30 per cent greater than it was in 1938.

According to the Forest Service, too much forest land is still being stripped of its timber and left incapable of further production for years to come. The foresters warn that the nation cannot continue to eat into its forest capital and reduce the productive capacity of its forest land without serious consequences. It will be necessary to build up the growing stock of timber. It will take many years to bridge the gap between cut and growth, and longer still to develop the full potential output of American forests. It is more than likely that before the gap is bridged there will be a period when the United States will have to get along with less lumber and other forest products.

The United States cannot count on large-scale imports to augment its supply of lumber. Few countries of the world have surplus sawtimber. Russia has extensive forests but its own demands for forest products are increasing. The well-managed forests of Sweden and Finland produce exportable surpluses, but they have big markets close at hand. Net imports of sawn lumber and timber from Canada averaged about 500 million board feet for several years before the war, but in Canada, like the United States, timber supply is dwindling while demands from the home market and for export are increasing. Postwar exploitation of Latin American forest resources may make available larger quantities of tropical hardwood timber but the type of material obtained will be suitable mainly for cabinet woods and other specialty uses rather than for construction lumber. The great Parana pine forests of Brazil may provide an increasing volume of softwood lumber, but expanding home markets may absorb much of it.

The United States, on the other hand, may be called upon for a large volume of timber for reconstruction and development in Europe and Asia. Cutting enough timber to meet its own needs in the immediate postwar years, however, will continue to eat into its forest capital. Any large-scale exportation of timber, therefore, will further jeopardize its own future supplies.

CHARLES E. RANDALL,
U.S. Forest Service.

LUMBER PRODUCTION BY PRINCIPAL PRODUCING

STATES—1944
(Preliminary Estimates)
Thousand Board Feet

State	Total	State	Total
Alabama	1,844,224	Montana	404,342

LUTHERAN CHURCHES OF AMERICA. Of primary importance to Lutherans of America in 1945 was the restoration of relations with the churches of Europe. American leaders went overseas in March, visiting bishops of the Scandinavian countries and headquarters of the World Council of Churches in Geneva. Dr. S. C. Michelfelder took up residence in Geneva in mid-summer, to act as representative of the American Section of the Lutheran World Convention.

Americans seek to help the European churches to recover from the effects of severe persecution by the Nazis and from damage to organization and property resulting from the war. In 1945 a fund of \$2,500,000 was raised in America for work entitled "Lutheran World Action," a large part of which was allotted to European relief work. A sum of \$10,000,000 for such work will be sought in 1946-47.

In consequence of efforts on behalf of the European churches, increasingly close relations are being established among the segments of American Lutheranism working together in the common project. In January a new constitution was adopted by the National Lutheran Council, which pledges two thirds of the Lutherans in America to co-operate in spheres of work never before attempted by them in common. The remaining third, the Missouri Synod, has been working with the National Council group in planning European relief.

Intensive effort to provide adequate ministry of the Lutheran Church to men and women in the armed forces continued in 1945, through assistance to army and navy chaplains and through maintenance of 75 service centers. Several new centers were opened in foreign countries during 1945. This work is gradually shading off into a new type of ministry to returning service personnel, especially to wounded veterans. Under the Division of Welfare of the National Lutheran Council, chaplains will be supplied for the vet-

erans' hospitals to the extent that the Lutheran Church is asked to provide them.

Wartime efforts of Lutherans to follow migration of population to war-industry areas has been organized in 1945 into a continuing program under the Division of American Missions, National Lutheran Council. Until population movements are stabilized, an active program to meet recurring emergencies will be undertaken.

Lutheran congregations have checked during 1945 the loss of enrolment in the Sunday and weekday schools which has continued since 1940. Efforts to restore enrolments to normal numbers are in progress. Church attendances and financial support of the congregations have been at a high level through the year.

Following are the latest statistics available on all Lutheran Churches in the United States and Canada:

Baptized members	5,390,280
Confirmed members	3,796,516
Organized congregations	16,087
Ordained ministers	13,953

In 1944, Lutherans raised a total of \$88,121,784, of which \$66,622,542 was for local expenses, and \$21,506,346 for benevolences.

DR. G. ELSON RUFF,
Editor of The Lutheran.

LUXEMBOURG. A grand duchy of western Europe, bounded by Belgium, France, and Germany; area, 999 square miles; estimated population (1942), 301,000, the majority being Roman Catholics. The chief town is Luxembourg (pop. December 1935, 57,740), others being Esch-Alzette (27,517), Differdange (15,945), and Dudelange (13,572).

Luxembourg, from 1815 to 1866 part of the German Confederation and customs union, was in 1867 declared neutral. Invaded and occupied by the Germans in 1914, it was declared free of all German ties by the Treaty of Versailles. In 1922 Luxembourg entered into a 50-year economic union with Belgium, providing for the abolition

of customs barriers between the two countries, and for the use by Luxembourg of the Belgian currency. On May 10, 1940, the Grand Duchy was again invaded and occupied by the Germans. Its ruler, the Grand Duchess Charlotte, fled to France and later established a government in exile in Montreal, Canada, some Cabinet offices being set up in London. A German decree (announced on Aug. 30, 1942) annexing Luxembourg to Germany and conscripting Luxembourgers for service in the German armies, was answered by a general strike, to which the Germans replied with a series of executions and mass deportations.

Education is compulsory for all children between the ages of 6 and 13 years. There are several colleges, advanced technical schools, and other special schools. About 32 per cent of the population is engaged in agriculture. The leading crops are oats, potatoes, and beet roots. Mining and metallurgy are the most important industries, production figures for 1938 showing 5,140,632 metric tons of iron ore, 1,436,506 of steel and 1,550,703 of pig iron. In 1938 there were 2,644 miles of roads, of which 1,301 miles were state roads, in 1937, 339 miles of railway, 796 miles of telegraph line, and 1,485 miles of telephone line. Post offices numbered 144.

On Sept. 10, 1944, Allied invading forces freed the capital of the Germans, and five days later the entire duchy was liberated. But the northern half again became the path of the Germans in their December 16 drive to the Meuse. By Jan. 27, 1945, they were finally expelled. On Feb. 23 the Belgo-Luxembourg Economic Union signed a pact with France for the exchange of Belgian coke and coal for French ore. A month later Luxembourg signed an agreement with France, the Netherlands and Belgium pledging mutual consultation on all economic matters. The Grand Duchess Charlotte returned to her country on April 13. Luxembourg was represented at the San Francisco Conference in the spring of 1945.

M

MACAO. See PORTUGUESE COLONIAL EMPIRE.

MacARTHUR, Douglas, United States Army officer; b. Little Rock, Ark., Jan. 26, 1880. Regarded as one of the ablest military leaders the United States has ever produced, General of the Army Douglas MacArthur is the son of the late Gen. Arthur MacArthur. He was graduated from the United States Military Academy in 1903, at the head of his class. In the First World War, he fought in several major Allied offensives and was twice wounded in action. In November 1930, he was appointed chief of staff of the United States Army—the only chief of staff in the history of the country whose father had held the same position, and at the age of 50, the youngest officer to hold it since the First World War. In 1935, General MacArthur was ordered to the Philippines to direct the organization of national defense for the Commonwealth government, and in 1936, was named field marshal of the Philippine Army. He was retired at his own request in 1937. On July 26, 1941, as American-Japanese relations

grew more strained, he was recalled to active service, appointed commanding general of the Far East Command, and commissioned lieutenant general. After Japan's attack on Pearl Harbor in December 1941, he was named commander in chief of United States Armed Forces in the Far East, with the rank of full general, and charged with the defense of the islands. He led American and Filipino troops against the Japanese, and when forced to abandon Manila on Dec. 26, 1941, withdrew his forces to Bataan Peninsula. His magnificent defense of Bataan astounded military experts and endeared him to the American people. In March 1942, he was ordered by the late President Roosevelt to surrender his command to Maj. Gen. (now Gen.) Jonathan M. Wainwright, and evacuate to Australia. On March 16, he assumed command in that theater with the title of commander in chief of Allied Forces in the Southwest Pacific area. On March 16, 1943, General MacArthur completed his first year in Australia, a year whose first weeks proved discouraging in the extreme, bringing to

his command a slow and inadequate supply of men and matériel. He succeeded, however, in co-ordinating his forces effectively, and in May 1942, made his first tentative move on the road back. Then followed in rapid succession the Japanese defeat in the Coral Sea in that same month; the Battle of Midway on June 7; and on August 7, the beginning of the Solomon Islands campaign with the landings on Guadalcanal. In November 1942, General MacArthur personally directed the Allied drive across New Guinea's Owen Stanley Mountains to dislodge the Japanese from Buna and Gona. On March 3, 1943, he announced the destruction in the Bismarck Sea of a 22-ship Japanese convoy moving on New Guinea. With Admiral William F. Halsey, he launched a joint offensive in the Southwest Pacific on July 1, 1943. There followed Allied landings and conquests in the Gilberts, Marshalls, and the Marianas, pointing along the sea road to Tokyo. On Oct. 20, 1944, General MacArthur made good his promise to return to the Philippines with the invasion of the Philippine island of Leyte; less than three months later, Jan. 9, 1945, he invaded Luzon. The ensuing liberation of Manila and reconquest of the Philippines paved the way for operations in the Ryuku and other enemy-held archipelagoes. When the Japanese government radioed its surrender offer on Aug. 14, 1945, General MacArthur, as senior Allied officer in the Orient, was designated to arrange terms of capitulation for Japan's representatives. On September 2, aboard the American battleship *Missouri* in Tokyo Bay, he accepted the formal surrender of Japan to the Allies. He was promoted general of the army Dec. 15, 1944. Following Japan's surrender General MacArthur was made commander in chief of the occupation forces in Japan to enforce compliance with the surrender terms.

MacDOUGALL, Alice Foote, American restaurant owner: b. New York, N.Y. 1867?; d. there, Feb. 10, 1945. A well-known figure in the world of business, Mrs. MacDougall built up a \$2,500,000 restaurant enterprise out of \$38 and a coffee-blend formula. Her unique restaurants, designed after European patios, were among the most popular eating places in New York City during the 1920's and early 1930's.

Mrs. MacDougall started a small coffee business after the death of her first husband, who was a jobber in green coffee. The fame of this coffee spread rapidly, and she rented a tiny shop in Grand Central Terminal, where she also served food. Gradually, more shops were opened until she had six flourishing restaurants, and also sold coffee, various foodstuffs and pottery. In 1930, she entered into an agreement with other persons who took over her business and her name, and within the next two years, the entire business went into the hands of the receivers. Less than six months later, she had regained control of the business, taking over two shops personally, while friends ran the other three. However, she was active in business only three more years, retiring in 1935.

MacDOUGALL, Hamilton Crawford. See *Music—Necrology*.

MACKENSEN, August A. F. L. von, German Army officer: b. Haus Leiptnitz, Saxony, Germany, Dec. 6, 1849; d. Celle, Germany, Nov. 8, 1945. One of the most successful German military leaders in the First World War, Field Marshal von Mackensen helped drive the Russians

from Poland in 1914-15, and his troops conquered Serbia in 1915 and Rumania in 1916. Educated at the gymnasium at Torgau and the University of Halle, von Mackensen entered the 2d Death's Head Guard Hussars as a cadet in 1869 and served in the Franco-Prussian War the next year as a noncommissioned officer. He was appointed to the General Staff in 1882. After serving as lieutenant general in command of the 36th Division (1903), and general of cavalry in command of the 17th Army Corps (1908), he was made head of the Ninth Army on the Eastern Front at the outbreak of the First World War. In the early part of the war he took part in the East Prussian campaign, especially in the battles of Gumbinnen, Tannenberg, and the Masurian Lakes, but he did not become conspicuous as an independent leader until the big German offensive in western Galicia in May 1915. During that year he took command of the Eleventh Army, was promoted general field marshal, and given the command of the combined Central Power armies in the Balkans. In October and November 1915, as commander of the army sent against Serbia, he overran that nation, occupying the entire country within seven weeks. In the succeeding campaign, his army, reinforced by the Bulgarians and the Turks, occupied the larger part of Rumania by the middle of January 1917. Through a ruse the French captured him while he was directing the return of his troops through Hungary, and he was kept a prisoner from the armistice until December 1919. The next year he retired from active service. In 1933 he was made a state counselor, and Hitler utilized his prestige at parades and demonstrations, and employed him to give speeches before Hitler Youth gatherings. He was captured by Allied troops in April 1945.

MacRORY, Joseph, Cardinal, Irish ecclesiastic: b. Ballygawley, County Tyrone, Northern Ireland, March 19, 1861; d. Armagh, Northern Ireland, Oct. 13, 1945. Roman Catholic archbishop of Armagh and primate of All Ireland, Cardinal MacRory achieved note as a scholar, theologian, author, and vigorous preacher. An Ulsterman by birth and descent, Cardinal MacRory was educated at St. Patrick's Seminary, Armagh, and completed his training at Maynooth College. Early in his career, he was first president of Dungannon Academy. He was ordained in 1885. In 1887 he became professor of moral theology and sacred scripture at Olton College, Birmingham. Two years later he returned to Maynooth and held professorships until 1912, when he became its vice president. In 1915 he was appointed bishop of Down and Connor, and in 1928 archbishop of Armagh. He was created cardinal Dec. 16, 1929. Popular among all political parties, Cardinal MacRory was chosen a member of the Irish Convention, representing all parties and interests, which in 1917 and 1918 attempted to reach a solution of the Irish home-rule problem. He felt the partitioning of Ireland was a "flagrant and intolerable injustice against Catholics doomed to live under the narrow and unjust domination of the Belfast parliament and executive." In 1942 he was bitterly opposed to the presence of British and American troops in Ulster.

MADAGASCAR. An island in the Indian Ocean 240 miles off the southeast coast of Africa. A colony of France, dependencies of Madagascar are the Isles Comores (Comoro Archipelago), consisting of Grande Comore, Anjouan, Mayotte

and Mohéli; and Juan da Nova, Europa and Bassas da India. Madagascar and its dependencies have an area of 241,094 square miles, and a population of 4,037,482. In 1936, 3,758,338 of its inhabitants were Malagasy, 25,255 French and 14,343 foreigners. The capital is Tananarive (pop. 126,515), and other large towns are Majunga (23,684), Tamatave (21,421), Antsirabe (18,215), Tuléar (15,180), Fianarantsoa (14,740) and Diego Suarez (12,237). Majunga, Tamatave, Tuléar and Diego Suarez are the principal ports.

Government.—In June 1943, the French National Committee appointed M. de Saint Mart governor general of Madagascar. He is assisted by a Consultative Council of Administration, and by an advisory council which comprises French and native sections. In February 1945, a decree was promulgated establishing a local government in the south of Madagascar, which, the authorities claimed, was a first step in applying to Madagascar the federative program of administration planned at the Brazzaville colonial conference (1944), for promoting the economic, political, and social development of the French colonies.

The Budget and Foreign Trade.—The budget of Madagascar and its dependencies for 1943 was 495,644,000 francs, an increase of 19,500,000 francs over that of the preceding year. (At the exchange rate current in mid-1943 of 43.6 francs to the dollar, the total budget amounted to about \$11,368,000). Revenue is derived from a poll tax, taxes on land, cattle and houses, customs, posts and telegraphs, and markets. Since the middle of 1943, export of Madagascar's chief products—coffee, vanilla, wax, rubber, graphite, and manioc—has been resumed, with a corresponding rise in imports. Madagascar's foreign trade in 1944 almost doubled that for the preceding year in both quantity and value. Exports for 1944 amounted to 132,100 metric tons, valued at 1,262,891,108 francs, compared with 72,935 metric tons, valued at 465,354,266 francs in 1943. Imports in 1944 amounted to 61,566 metric tons, valued at 653,729,676 francs, compared with 36,385 metric tons, valued at 444,110,050 francs in 1943. While the volume of both exports and imports was still less than half that for 1938, the value of both exceeded that for 1938. This increase was due in part to the rise in prices, and in part to the fact that in February 1944 the franc had been depreciated 13 per cent in Madagascar and certain other French colonies. Owing, however, to the two-way expansion in foreign trade it was possible to raise the budget for 1945 nearly 100,000,000 francs above that for 1944, and to launch a 2,000,000,000 franc loan for a ten-year program of public works.

Production.—The principal crops under cultivation are rice, manioc, corn, sweet potatoes, haricot beans, potatoes, cotton, vanilla, and sugar cane. Cattle breeding is important. The people get from the forests, barks for tanning and dyeing, and wild rubber. Minerals of greatest economic importance are graphite, mica, corundum, gold and phosphates. Meat-canning, sugar refining and soapmaking are major industrial activities; straw hats are made; and silk and cotton woven.

In 1944, despite a 14 per cent increase in acreage planted over the preceding year, important food crops were reduced by late and insufficient rainfall, which also meant the loss of several hundred thousand head of cattle. The principal minerals showed increases in production, and minerals accounted for some 83 per cent

of the total value of the colony's exports. Manioc manufacturing in 1944 fell 50 per cent below normal, but peanut oil and soap factories gained 81 and 16.6 per cent respectively over the year preceding. Meatpacking, aided by shipments of tin plate from the United States, held its own, but exports were limited because of lack of space on refrigeration ships.

Communications.—Railroads have an aggregate length of 534 miles, and there are nearly 16,000 miles of roads suitable for motor traffic. Air transport services link the island with the French colonies in Africa. External telegraphic communications are both cable and wireless. In January 1945 it was reported that a bimonthly air service had been opened between Madagascar and the Comoro Islands.

Public Health.—On the basis of experimentation in cinchona cultivation, begun in 1930, Madagascar was reported in November 1944 to be able to produce quinine valued at 4,000,000 francs at an annual cost of 300,000 francs. Large quantities of asiaticoside, a drug used in combating leprosy, are being produced in Madagascar laboratories. The Tananarive School of Medicine, founded in 1896, granted diplomas to nine physicians, including three women, in 1944. Madagascar doctors of the native medical services were granted substantial increases in salary.

Education and Religion.—Education is compulsory between the ages of 6 and 14 in the primary European schools, and between 8 and 14 in the schools for natives. All children are required to learn the French language. There are two lycées, 1,011 government schools with 126,947 pupils, and 706 private schools with 94,232 pupils. At the capital there are a school of native medicine, a school of administration, and a native industrial school. The colony also has three agricultural schools.

While a large proportion of the tribes in the central districts have been Christianized, the majority of the Malagasy, particularly the tribes in outlying regions, remain heathen. Many Christian missions, French, American, British and Norwegian, are active in the island.

MADEIRA. The largest of a group of Atlantic islands comprising the Funchal District of Portugal (the Madeira Islands), approximately 535 miles southwest of Lisbon and 360 miles west of Morocco. The group, which also includes the islets of Porto Santo, the Desertas, and the Salvages, has a total area of 314 square miles and a population (1940) of about 250,000. It was first settled by the Portuguese in 1431 and was later under Spanish and English rule. Funchal, the capital (pop. 1940, 48,493), is a seaport and an episcopal see. The inhabitants are predominantly Roman Catholic. Owing to its healthful climate, Madeira is a popular health resort. The chief product is wine, exports annually amounting to about 700,000 gallons. Other products are sugar cane and bananas. Industries include fishing and the making of embroidery, linen, woollens, leather, straw hats, and baskets.

The chief imports are coal, wheat, rice, corn, and textiles. Exports, consisting largely of embroideries and wine, were greatly reduced after 1939 because of the war. In 1944, exports of embroideries—with which nearly a fifth of the population of the islands are connected—were valued at 121,669,516 escudos, compared with 68,076,014 escudos in 1943. (One escudo = approx. 4 cents in United States currency.) The United States accounts for larger purchases of

this commodity from the islands than do all other countries combined, and in 1944 its purchases were more than twice those for 1943. Exports for 1945 are expected to amount to even more than in 1944.

MAGNESITE AND MAGNESIUM COMPOUNDS.

The mine output of domestic crude magnesite in 1944 was 561,450 short tons valued at \$4,407,461, a figure higher than any previous year except 1943, when 754,832 tons valued at \$6,071,596 were mined. This decline was caused by the closing of Basic Magnesium Inc.'s flotation plant at Gabbs, Nev., late in 1944. Caustic-calcinated magnesite sold or used by producers in 1944 amounted to 139,243 short tons valued at \$6,481,963, while refractory magnesite sold or used by producers in 1944 totaled 278,490 tons valued at \$8,426,049. The demand for magnesite in refractories was heavy, though less than in 1943. Sales of caustic-calcinated magnesite for oxychloride cement flooring declined, but shipments of caustic-calcinated magnesite for use in fertilizers, epsom salt, and rubber remained high. The amount of dead-burned dolomite sold in 1944 was 1,290,790 short tons valued at \$11,441,612.

MAGNESIUM. Cutbacks in operation of primary magnesium producing facilities during 1944 totaled 83 per cent of installed capacity and were the result of decreased war requirements and growing ingot stocks, according to the United States Bureau of Mines. The production of primary magnesium in the United States totaled 157,100 short tons or 14 per cent less than the 183,584 tons produced in 1943. These production figures represent metal produced directly from Dow-type electrolytic plants plus the "ingot equivalent" of the raw and crystal magnesium obtained from plants using other processes of production. The total output of all primary magnesium in raw, crystal, and ingot forms, making no allowances for melting losses, was 161,935 tons in 1944, compared with 190,025 tons in 1943. Recovery of secondary magnesium totaled 14,185 short tons (including secondary magnesium incorporated in primary magnesium ingot) in 1944, as compared with 11,404 tons in 1943, and required the consumption of 17,014 tons of magnesium scrap, which was almost entirely new scrap. Even though restrictions on the use of magnesium in civilian products were removed in October 1944, virtually all the metal consumed during that year went into military uses. The most important uses were incendiary bomb casings, aircraft engine parts, airframes, and landing gears. Other important uses included rocket launcher tubes, powder for incendiaries, flares, and tracers, and as an alloying metal with aluminum. Actual consumption of primary magnesium and magnesium-base alloy (excluding secondary) in 1944 totaled 132,698 tons (magnesium content).

In 1944 exports of magnesium in primary form totaled 21,001 tons (including 16,171 tons of magnesium-base alloy) and were equivalent to about 13 per cent of the total domestic production. Of the total exports of metal in primary form, 15,958 tons went to the United Kingdom and 4,996 tons went to the USSR.

World production of primary magnesium in 1944 is estimated to have been 235,100 metric tons, or 13 per cent less than the all-time record of 269,800 tons in 1943. Meager statistical data indicate that 29 per cent of the total output was under Axis control, whereas about 71 per cent was under the control of the United Nations.

MAINE. New England state, United States; admitted to the Union March 15, 1820. Population (1940): rural, 504,169; urban, 343,057; total, 847,226. Land area, 31,040 square miles, divided into 16 counties. Chief cities, with 1940 populations: Portland, 73,643; Lewiston, 38,598; Bangor, 29,822; Auburn, 19,817; Biddeford, 19,790; Augusta, the capital, 19,360; Waterville, 16,688.

Chief State Officers, 1945.—Governor, Horace A. Hildreth; secretary of state, Harold I. Goss; treasurer, Joseph H. McGillicuddy; comptroller, J. James Allen; attorney general, Ralph W. Farris.

Judiciary.—Chief justice of the Maine Supreme Judicial Court, Guy H. Sturgis; associate justices, James H. Hudson, Harry Manser, Sidney St. F. Thaxter, Arthur Chapman, Harold H. Murchie.

Legislature.—The state legislature (Senate, 33 members; House of Representatives, 151) meets biennially in odd years on the first Wednesday in January.

Education.—At last report (1943-44) there were 1,704 public elementary schools in the state, with 4,350 teachers, and a net enrollment of 116,328 pupils. Elementary school teachers received an average yearly salary of \$1,123. Public junior high schools and class B high schools numbered 16, with 151 teachers, and 3,103 students. Public senior high schools (not including academies) numbered 180, with 1,531 teachers, and 31,924 students. High school teachers received an average yearly salary of \$1,726. There are four teacher training schools. The University of Maine receives financial aid from the state. Education in Maine is free for all persons between the ages of 5 and 21, inclusive. Total state appropriation for education (1944), \$3,482,653.66.

Finances.—Following is a statement of Maine's finances for the fiscal year 1944-45, supplied by the state treasurer's office:

Balance in treasury, beginning of fiscal year 1944-45	\$ 7,317,773.25
Receipts, 1944-45	67,698,480.47
Total	\$75,016,253.72
Disbursements, 1944-45	66,430,323.63
Balance, beginning of fiscal year 1945-46	\$ 8,585,930.09

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.).....	575	640	585
Oats (1,000 bu.).....	3,933	3,515	2,960
Buckwheat (1,000 bu.)..	137	120	108
Barley (1,000 bu.).....	118	84	84
Hay:			
Clover and timothy (1,000 tons).....	478	415	536
Tame (1,000 tons)....	807	729	951
Potatoes (1,000 bu.)....	46,102	53,868	58,025
Apples (1,000 bu.).....	600	912	180

MALINOVSKY, Rodion Yakovlevich, Soviet Army officer; b. 1898. Like most of his fellow officers in the Russian high command, Marshal Malin-

ovsky is young. Born 48 years ago in Odessa, he was off to the wars as a lad of 15, a stow-away aboard a troop train bound for a First World War front. He was attached to a machine gun crew; saw 15 months' continuous service; was wounded; and before his 18th birthday, was promoted corporal and awarded the St. George Cross. In 1915, he was sent to France where he fought with French, British, and American troops. He returned to Russia in August 1919 to join the revolutionary forces, and with the civil war's end, remained in the Red Army. In 1930 he completed studies at Frunze Military Academy, and was appointed chief of staff, later commander, of a cavalry regiment. At the time of the German invasion, he was a corps commander in Bessarabia. In the spring of 1942, he commanded an army of Siberian troops defending Stalingrad, and in the Russian counteroffensive at the year's end, his forces blocked General von Mannstein's efforts to relieve General von Paulus' Sixth German Army trapped in the city. Throughout 1943 and 1944, Marshal Malinovsky continued to take a major role in the Russo-German conflict, directing his forces for a brilliant series of victories—the capture of Rostov (Feb. 14, 1943), of Kharkov (August 23), and Stalino (September 8); a juncture with General Konev's troops (October 26) which virtually freed the Dnieper (Dnepr) bend area. On Feb. 22, 1944, his Third Ukrainian Army liberated Krivoi Rog, vital iron ore center, and on April 10, Malinovsky's home city, the Black Sea port of Odessa. A year later, the Marshal was on the soil of "Greater Germany," directing operations of the Second Ukrainian Army against the Austrian capital of Vienna. His troops co-operated with troops of Marshal Tolbukhin's Third Ukrainian Army to complete Vienna's occupation on April 13. On Aug. 8, 1945, Marshal Malinovsky commanded the Trans-Baikal Army for the brief Soviet campaign in Japanese-occupied Manchuria.

MALTA. An island (95 square miles) in the Mediterranean Sea, 58 miles south of Sicily, which with Gozo (26 square miles) and Comino (1 square mile) constitutes a British colony (122 square miles), having a civilian population (Dec. 31, 1943) of 272,121. Valletta (pop. 22,779) is the capital, chief port, and an important naval base. The governor (Lieut. Gen. Sir Edmond Schreiber appointed in September 1944) heads a Council of Government comprising 8 official and 12 unofficial members (10 of the latter elected). During 1945 a National Assembly was engaged in drafting a new constitution for the colony, implementing the undertaking given in 1943 by the British government that responsible government was to be restored in Malta after the war. Revenue in 1943-44, including a grant from the British Treasury of £1,350,000, was £4,026,373; and expenditure was £3,731,831. With cessation of hostilities in the Mediterranean, revenue increased to four times the prewar figure, and far exceeded expenditure. English is the official language, and Maltese is the official language of the courts. Trial by jury in both civil and criminal cases was resumed in 1944. President Franklin D. Roosevelt and Prime Minister Winston Churchill conferred in Malta in February 1945, prior to attending the Yalta Conference with Marshal Stalin. During the war against Italy, 1940-43, casualties among civilian Maltese totaled 5,286 (1,579 killed); and of nearly 45,000 houses in

Malta, 27,953 were damaged by enemy action (5,316 totally demolished, 5,019 severely damaged, and 17,618 partially damaged). When water supplies were running short, military engineers, by boring, discovered unlimited quantities from a gusher, 300 feet down, in the center of the island.

In 1944-45 there were 94 primary schools (approximately 35,000 pupils); 130 night schools; 4 secondary schools for girls (about 660 students); a lyceum for boys (700 students); a preparatory secondary school for boys and girls (490 pupils); 1 technical school (120 pupils); and 60 private schools (12 state aided). Royal University averages about 250 students.

Chief agricultural products (from 41,000 acres) are wheat, barley, tomatoes, potatoes, onions, cumin seed, cotton, grapes, figs, and other fruits. In 1938 livestock included 34,470 goats, 15,936 sheep, 8,799 horses, mules and asses, and 4,540 cattle. Fishing is of importance. Butter, cotton, filigree, lace, and wine are manufactured, and fruit is canned. The colony has no railroads; buses plying on good roads link the towns. A public ferry runs between Malta and Gozo.

MANCHURIA (Japanese MANCHUKUO). A region including the three northeastern provinces of China, bounded (roughly) on the west by Inner Mongolia and the Khingan Mountains, on the south by the Yellow Sea, on the southeast by Korea, on the east by the Maritime Territory of the Union of Soviet Socialist Republics, and on the north by the Argun-Amur rivers. Original home of the Manchus, former rulers of China. Prior to the Japanese occupation (1931-45), Manchuria, with its exceptionally rich soil, had been attracting large numbers of immigrants from crowded central China. Its area was given in 1930 as 363,610 square miles, its population at that time being estimated by Chinese authorities at about 30,000,000. Occupied by the Japanese, beginning in 1931, its area was extended in February 1932 to include the province of Jehol, and the territory so enlarged was set up as the nominally independent state of Manchukuo under Japanese control. During the Japanese occupation, which ended with the defeat of Japan in August 1945, the nominal government of Manchukuo consisted of a chief executive, a privy council, and a cabinet. Henry Pu-yi, formerly boy emperor of China, was crowned emperor of Manchukuo under the name of Kang Teh, in March 1934; but the real power lay in the hands of the Japanese vice ministers, and the Japanese ambassador. The area of Manchukuo coincided with the provinces of Heilungkiang, Kirin, Liaoning (Fengtien), and Jehol, as shown on the official map of China (*China Handbook*, 1937-1943, New York, 1943). Manchuria was specifically mentioned in the communiqué (of Dec. 1, 1943) following the Cairo Conference, among the territories stolen from the Chinese by the Japanese which were to be restored to the Republic of China after Japan's surrender. This agreement was confirmed, insofar as the USSR was concerned, under the terms of the Sino-Soviet treaty of August 14, 1945. (For details of this treaty affecting Manchuria, see section PRINCIPAL EVENTS in this article.)

Prior to the Japanese surrender, the area of the Japanese puppet state (Manchukuo) was given as 503,013 square miles, its population (est. 1940), as 42,233,954. These figures (like others derived from Japanese sources during the

occupation period) were considered unreliable by the Chinese authorities.

Restoration to China of the southern end of the Liaotung Peninsula, which had been known as Kwantung (q.v.), leased to Japan since the Russo-Japanese War (1904-05.), will add to the territory an area of 1,438 square miles, and a population (1939) of 1,750,000. Dairen (Dalny), in Kwantung, had an estimated population (1939) of 533,696; Port Arthur (Chinese, Lushun; Japanese, Ryojun), 145,286. The principal cities of the puppet state of Manchukuo were: Mukden (Moukden, Feng-Tien, pop. 1944, 1,135,801); Harbin (661,984); Hsinking (Changchun, Kwanchengtse, the capital, 544,202); Antung (1939, 315,242); Anshan (1944, 213,865); Yingkow (Newchwang, 180,871); and Kirin (173,624).

Education and Religion.—In 1939 there were 15,877 primary schools with 1,579,169 pupils, 254 secondary schools with 60,368 pupils, 16 normal schools with 4,045 pupils, 66 vocational schools with 5,043 pupils, and 14 colleges with 4,372 students. The chief religions, named in order of the number of their adherents, are: Buddhism, Taoism, Roman Catholicism, Mohammedanism, and Protestant Christian sects.

According to a news bulletin of the National Geographic Society, the Japanese railway authorities established research laboratories and experimental farms, hospitals, schools, and libraries, as well as auxiliary industrial services, along the Manchurian railway lines, aiming thereby to make them bearers of Japan's culture as well as means of exploiting Manchuria's material resources.

Finances.—The general budget for 1941 was balanced at 649,220,000 yuan; special budget revenues amounted to 1,849,077,161 yuan, expenditures reaching 1,758,175,290 yuan. From 1935 until the Japanese surrender, the yuan was linked with the Japanese yen. In February 1941 Japanese investments in Manchukuo amounted to 2,471,200,000 yen, chiefly in the South Manchurian Railway Company and in state companies.

Products.—The soil is extremely rich and fertile, the arable land being estimated in 1937 as 80,890,656 acres. The principal crops are soybeans (which made the territory the wealthiest part of old China), with a yield in 1940 of 3,827,000 metric tons, kaoliang, millet, corn, wheat, rice, and cotton, with some Manila hemp and hempseed, flax, herbs, and tobacco. Livestock in 1940 included 1,683,200 cattle, 1,998,000 horses, and large numbers of other draft, meat, and dairy animals. The forest area amounts to 216,805,540 acres (roughly $\frac{2}{3}$ of the total area), making lumber another leading industry. Mineral resources include coal (with an estimated yield in 1941 of 24,500,000 metric tons), iron (reserves of which before the war were believed to be many times those of Japan), gold, silver, lead, magnesite, and oil shale. Important steel and shale-oil plants are located at Anshan and Fushun, flour and oil mills at Harbin, and factories (recently established) for the manufacture of textiles, beer, and metal products, at Mukden and Newchwang.

Foreign Trade.—Foreign trade (both import and export) has been predominantly with Japan. Principal exports (valued in 1939 at 826,190,000 yuan) were in order of their value: soybeans, bean cakes, coal and bean oil. Principal imports (amounting in 1939 to 1,783,366,000 yuan), were in order of their value: machinery and

tools, iron and steel, wheat flour, paper, sugar, cotton fabrics, and raw cotton. During the Second World War the Japanese came to depend upon recently developed Manchurian industrial centers, particularly Anshan, for much of their iron and steel, chemicals and explosives, fuel oils, building materials, machinery and locomotives.

Communications.—At the beginning of 1941 the railway mileage in Manchukuo totaled 7,590, chiefly in state railways, of which the Japanese, since 1933, had financed about 3,500 miles, designed mainly for strategic use against China or the Soviet Union, and depended upon by the Japanese as a major economic and strategic resource during the Second World War. Manchukuo in 1940 had some 27,900 miles of motor highways, over 4,000 miles of navigable inland waterways, and nearly 10,000 miles of airways. It is mainly upon the railways that Manchuria has depended for its economic growth. Harbin, in the north, became the hub of the two main Manchurian railway lines and of river traffic. Mukden, in the south, became the junction point of lines from northern Manchuria, Korea, Dairen, and Tientsin. Dairen, the planning of which as a modern city, railway terminal, and port was begun by the Russians in 1898, has over two miles of piers and docks, and can accommodate steamers of up to 25,000 tons. As an all-year harbor free to world commerce, to be shared by China and the Soviet Union under their recent agreement, it is expected to become not only the main outlet of the new Manchuria, but one of the leading ports of northeast Asia. Antung, on the Yalu River, on the Korean border, is another important port.

Principal Events.—On Aug. 9, 1945, following a Soviet declaration of war against Japan, Red Army forces invaded Manchuria from three directions: from the west, in the region of Lake Dalai and Lake Bor (Buir), in the northeast, across the Ussuri and Amur rivers, opposite Khabarovsk, and along the eastern Manchurian frontier, west and north of Vladivostok. On August 23, after rapid Red Army advances toward the main centers, it was announced by Premier Stalin that the Soviet forces had occupied the entire territory, including Dairen and Port Arthur, and were advancing into Korea. On the same day it was revealed that on August 17 the whole Kwantung army, Japan's main strategic reserve on the continent of Asia, had surrendered unconditionally to the Red Army command. Henry Pu-yi, puppet emperor of Manchukuo, had been captured at Mukden and interned. The Japanese surrender in Manchuria led within a few days to the release of a number of high-ranking Allied prisoners of war, including Lieut. Gen. (now General) Jonathan M. Wainwright, defender of Bataan and Corregidor, who had been taken to Manchuria from Formosa in November 1944.

In the meantime, on Aug. 14, 1945, a treaty had been negotiated at Moscow between Premier T. V. Soong, of China, and Premier Stalin, under which it was agreed that Manchuria should be restored to China (Soviet forces to begin their withdrawal three weeks after Japan's formal surrender). The Chinese Eastern and South Manchurian railways are to be combined into one system, to be called the Chinese Changchun Railway, which, it was agreed, will be jointly owned and operated by China and the Soviet Union* for 30 years, after which it is to be returned to China without payment. The port of

Dairen, to be placed under joint control of the two signatory countries, is to be open to all nations as a free port. Port Arthur (where the Russian Fleet, in 1904, was crippled by the Japanese, in an attack resembling that on Pearl Harbor) is to be used (according to the treaty of 1945) by both China and the Soviet Union as a naval base, the Chinese assuming responsibility for its civil administration, and the Soviet authorities for its defense. By the end of October industrially advanced Manchuria had become a potential center of civil war in China between the Kuomintang armies, near its southern frontier, and the Chinese Communists and other elements. By the end of 1945, the forces of the Chinese central government, with the co-operation of the governments of the USSR (under Sino-Soviet treaty) and of the United States, had occupied strategic centers in Manchuria and were reported to be moving into Jehol Province, which the Japanese had included in their puppet state of Manchukuo, and which had formerly been considered part of Inner Mongolia.

MANGANESE. The production of manganese ore containing 35 per cent or more manganese in 1944 was the largest since 1918 and the second most productive year on record, according to the United States Bureau of Mines. Shipments of this ore totaled 247,616 short tons compared with 205,173 tons in 1943. Of the manganese ore shipped from mines in 1944, 241,170 tons were metallurgical ore, 6,224 tons were battery grade, and 222 tons were for miscellaneous uses. The value, f.o.b. mines, of manganese ore shipped in 1944 was \$9,014,875.

Shipments of ferruginous manganese ore containing 10 to 35 per cent manganese amounted to 297,136 short tons in 1944; shipments of manganiferous iron ore containing 5 to 10 per cent manganese amounted to 1,190,476 tons valued at \$2,519,018 for the same period; and 1944 shipments of manganiferous zinc residuum totaled 247,402 short tons. Production and shipments of ferromanganese in 1944 totaled 702,632 short tons and 715,059 tons respectively, the value of shipments being \$91,406,229. Production and shipments of spiegeleisen totaled 165,530 short tons and 155,325 tons respectively, the value of shipments being \$4,851,490.

MANITOBA. Known as the Red River Settlement before it entered the Dominion in 1870, Manitoba is the central province of Canada. It is bounded east by Ontario, west by Saskatchewan, north by the Northwest Territories and the 440 mile shore line on Hudson Bay, and south by the states of North Dakota and Minnesota. Its area is 246,512 square miles (219,723 square miles of land; 26,789 of water), and its population (1941 census) 729,744, of which 407,871 was rural. The principal cities with their 1941 populations are Winnipeg (the capital), 221,960; St. Boniface, 18,157; Brandon, 17,383; Portage la Prairie, 7,189.

Government.—Manitoba is governed by a lieutenant governor and a legislative assembly of 55 members elected for five years.

The coalition government under the premiership of Stuart Sinclair Garson, K.C., and comprising members of the Liberal-Progressive, Progressive Conservative, and Social Credit parties, was dissolved in September 1945 and appealed for re-election on October 15. The vote resulted in the return to office of the government with 43 supporters, and an opposition group represented by 10 members of the C.C.F. (Co-

operative Commonwealth Federation), 1 Labor-Progressive and 1 Independent. In the electoral division of the city of Winnipeg 10 members are elected under the proportional representation, (Hare) system, thus providing for representation of minority groups; all other electoral divisions of Manitoba elect members by the use of the alternative balloting system, assuring representation of majority candidates. Manitoba is represented by 6 members in the Canadian Senate and elects 17 to the House of Commons.

Education.—A legislative committee presented a report on educational reforms in the spring of 1945. Emphasis is placed on creation of larger units of school administration, increased grants distributed on the basis of equalization of community resources, increased minimum for teachers' salaries, and increased facilities for vocational programs, the latter in the present period being principally devoted to rehabilitation of veterans. Dr. A. W. Trueman of Saint John, N.B., was appointed to the presidency of Manitoba University, and subsequently in August to the chairmanship of the Royal Commission on Adult Education, other members being Dr. Harold Innis of Toronto University, John Grierson, late head of the Canadian Film Board, J. J. Deutsch, economist, of the *Winnipeg Free Press* and late of the Bank of Canada, and Frances MacKay, director of extension work for women in the Manitoba government service. Arising out of the educational rehabilitation program for veterans, the university enrolment increased from 2,632 to 4,290 for 1945. There were 100,243 pupils enrolled in elementary grades in 1944, and 18,831 in secondary grades; these attending in 4,205 departments located in 2,090 school buildings. Scholarships now number approximately 700 for students attending secondary schools, the university and teacher training institutes.

Production.—Estimates for 1945 are: field crops, \$143,000,000; farm animals, \$34,500,000; poultry \$16,250,000; garden, \$2,250,000; honey and wax, \$500,000; dairying, \$22,000,000; fur farming, \$1,000,000. The 1941 census recorded 58,686 farms in the province with 16,891,322 acres on occupied farms.

In 1944, 33,413,900 lbs. of marketable fresh water fish were landed by 6,288 commercial fishermen, which netted them \$3,536,378. Varieties are pickerel, saugers, tullibees, pike, perch, sturgeon with whitefish and goldeyes, the best known and most desired on the Canadian and international fish markets. In 1943-44 there were 570 licensed fur farms, and an estimated value of raw furs exported of \$8,063,521. Manitoba has extensively developed conservation programs and planned muskrat areas in the north and successfully operated trap-line control measures for the wild fur industry. Fur auction sales at Winnipeg are leading international markets. Mineral production in 1944 was valued at \$13,728,126, of which \$10,379,677 represented metals. Copper, zinc, gold, silver and cadmium are among the metallic group. Nonmetallic production consisted of clay products, structural materials, peat moss and salt. The latter is produced and refined at the town of Neepawa.

Health.—The Department of Health and Public Welfare administers all laws relating to health and welfare. In 1945 there was instituted a complete health plan to assure rural citizens equal facilities with those of the cities. The plan is in process of being made a reality by an educational program throughout the province. It comprises creation of Health Units, providing preventive

service, diagnostic aids, medical care and community hospitals, with varying degrees of extensive government financial aid. Welfare developments in the year include creation of the Old Age and Blind Persons Board within the department. Decentralization of welfare administration to regional areas is under way. Health and welfare programs are being established to provide for adaptation of the federal government health insurance and social security policies within the present framework.

Rural Electrification.—Arising out of a royal commission report presented by Dr. Emerson P. Schmidt, chairman, in 1942, the Manitoba Power Commission in the summer months of 1945, as a culmination of a preceding educational campaign started a provincial-wide farm electrification project. As recommended, government financial support is extensive in respect to capital installations. Availability of equipment is a present factor in the construction program.

Agriculture.—Policies have been instituted for the creation of a province-wide veterinary service with special scholarship inducements offered for increasing the veterinary personnel. Financial assistance has been provided for vaccination of beef and dairy cattle to eliminate Bang's disease. The Manitoba Federation of Agriculture, at its 1945 annual meeting, created a new constitution to include co-operative and credit union organizations and hereafter will be known as the Manitoba Federation of Agriculture and Co-operatives.

Finances.—Provincial and local government revenues remain buoyant without changes in rates of taxation in general. This is illustrated by the peak profit in 1945 of \$1,307,939, by the Manitoba Government Telephone System (with ownership and operation of two radio stations); Manitoba Government Liquor Control Commission sales in 1944 of \$12,571,892; and increased turnover taxation returns from race meets, this latter bearing a higher rate on pari-mutuals. The Manitoba government presented a brief to the Dominion-Provincial Conference on Reconstruction in July which embodied proposals for readjustments in internal Canadian financial, economic and social relationships and upon the successful conclusion of which a broad postwar program is based, which includes programs established and for which plans are prepared by urban and rural communities. In addition to projects herein interpreted and under way, others include highways and public works and developmental plans for natural resources.

J. L. JOHNSTON,
Provincial Librarian.

MANUS. See NEW GUINEA, TERRITORY OF.

MARCUS ISLAND. A small island in the Pacific Ocean, north of the Tropic of Cancer, roughly in line between Wake and the Bonin Islands (Japanese), and only 1,185 miles (four hours by air) southeast of Tokyo. Fortified by the Japanese, it was heavily raided in September 1943 by United States naval vessels and carrier-based planes. During 1944 it was frequently bombed, and in October heavily shelled in a prolonged naval bombardment. Bypassed, with its estimated 5,000 Japanese troops in the Allied sweep to the west, it was a target for several further air attacks during the first half of 1945, and became subject to Allied occupation following the general Japanese capitulation, the garrison of 2,445 surrendering on August 31 to the commander of the U.S. destroyer *Bagley*.

MARIANAS ISLANDS. See JAPANESE SOUTH SEA ISLANDS.

MARINE CORPS, United States. The United States Marine Corps, in 1945, helped to deliver the final great blows which brought victory over Japan, and then took part in the occupation of that defeated country.

At Iwo Jima and Okinawa, and in the skies over Japan itself, marines carried to a climax their traditional amphibious mission, which had commenced in the Second World War at the moment the first Japanese plane attacked Pearl Harbor. The Marine Corps began the year with six divisions and four aircraft wings, comprising the bulk of the Fleet Marine Force in the field, ready for Pacific action.

On February 19, in the wake of a heavy pre-invasion naval and air bombardment, the 4th and 5th Marine divisions landed on the beaches of Iwo Jima, 760 miles from Tokyo. The small gourd-shaped island was stoutly defended by enemy troops dug into volcanic Mount Suribachi on the south and huge rock formations in the north. The major objectives, two airfields, were on the flat land between.

Although subjected to terrific artillery and mortar fire and hampered by the shifting sands which bogged down mechanized equipment, the marines drove a wedge across the island and isolated those troops on Mount Suribachi. On February 21, the 21st Marines of the 3d Marine Division, which was in corps reserve, began landing at 1530 where it was subsequently used on the left flank of the 4th Marine Division. The 3d Marine Division (less one regiment combat team) was not committed as a division between the 4th and 5th divisions until February 25. Division commanders were Maj. Gen. Graves B. Erskine of the 3d Division; Maj. Gen. Clifton B. Cates of the 4th Division; and Maj. Gen. Keller E. Rockey of the 5th Division. The three divisions were under command of the 5th Amphibious Corps, headed by Maj. Gen. Harry Schmidt.

On February 22, the attack on Mount Suribachi was begun. Twenty-two and a half hours later, after a resolute but bitter advance, men of the 28th Marine Regiment raised the American flag atop the volcano. The total weight of the offensive then turned northward, and by February 25, Motoyama Airfield No. 2 had been captured.

On March 6, the three divisions launched their final major assault. Opposition remained stubborn, with most survivors of the garrison fighting to the death, until their last stand was broken at Kitano Point, and Iwo Jima on March 16 was announced as secured.

Marine casualties totaled 19,938, including 4,189 dead. Conservative estimates placed the Japanese dead at 21,000. Five months later, as the war ended, a total of 1,259 prisoners had been taken.

Iwo Jima, as a fighter plane and reconnaissance base and B-29 way station, contributed much to the pressure which speeded Japan's final capitulation.

The 3d Marine Amphibious Corps, commanded by Maj. Gen. Roy S. Geiger, joined the 24th Army Corps to comprise the Tenth Army which struck at Okinawa, principal island of the Ryukyus chain, on Easter Sunday, April 1. The 3d Amphibious Corps included principally the 1st, 2d and 6th Marine divisions and six battalions of corps artillery. Of the 2d Division, only the 8th Regimental Combat Team eventually was committed.

MARINE CORPS

marine spotter plane flies an artillery control mission over the front lines at Okinawa.

Columnist Ernie Pyle (third from left) trudges along with First Division Marines on patrol in the interior of Okinawa.

Marines hurdle a stone wall as they drive across Okinawa.

Official U.S. Marine Corps Photographs

Okinawa, just 325 miles southwest of southern Japan, was strongly garrisoned by the enemy, but the Tenth Army's initial landings near Kadena were virtually unopposed. The 1st and 6th Marine divisions drove northward to attack the upper two thirds of the island, while the 24th Army Corps wheeled south.

The marines advanced swiftly against sporadic resistance, with concentrations of enemy forces seeking at several points to ambush the leading units. Fighting, on these occasions, was severe. Despite these encounters and the mountainous terrain, a battalion of the 22d Marines reached the island's northern tip on April 13.

Three army divisions meanwhile had collided with the bulk of enemy troops on the Naha-Shuri-Yonabaru line, one of the strongest defense systems in the Pacific. Progress against this maze of underground positions was slow.

On April 21, marines seized Taka and on April 22, Sesoko, islets just west of Okinawa, after which they moved to join the fighting in the south. On April 30, the 1st Division was attached to the 24th Corps and began relieving the 27th Infantry Division on the extreme right flank of the line. The 1st Division later swung over to the north of Shuri when the right half of its sector was taken over by the 6th Marine Division. On May 8, the 6th Division relieved elements of the 1st Marine Division in the right of the 3d Amphibious Corps' zone of action.

Marine ground and air forces on Okinawa were at this time visited by the commandant of the Marine Corps, Gen. Alexander A. Vandegrift, who was touring corps activities in the Pacific. General Vandegrift on April 4 had been promoted from lieutenant general to the rank of general, becoming the first marine commandant on active duty ever to be appointed to four-star rank.

Slowly Tenth Army lines surged forward. By May 28, the 6th Division had secured Naha. Shuri fell May 31. The 1st Division broke through to the coast on June 7, thus closing the escape route for Japanese forces on Oroku Peninsula. The Japanese fell back to their secondary defense line. On the 79th day of the campaign, the 8th Regimental Combat Team, after seizing two outlying islands—Iheya and Aguni, went into action and drove into Nagasaki. Organized resistance crumbled.

On June 18, General Geiger took over temporary command of the Tenth Army after Army Lieut. Gen. Simon Bolivar Buckner, Jr., had died in action. On June 19, General Geiger's promotion to lieutenant general was confirmed. On July 3 he was named commanding general of the Fleet Marine Force, succeeding Lieut. Gen. Holland M. Smith, who took command of the Marine Corps Training and Replacement Center at San Diego, Calif.

Okinawa was secured on June 21. The enemy's total land casualties in the marines' sector included 42,000 killed. Marine casualties totaled 16,013, of which 3,044 were dead.

The Fleet Marine Force was preparing for further amphibious action when Japanese surrender came. Marine units, including the 2d and 5th divisions and the 4th Regiment (6th Division) thereupon gained the Leathernecks' final goal—Japan—not as stormy invaders, but as part of the Allied occupation forces. The 4th Regiment was among the first occupying units to move into Japan from American warships.

On September 4, Brig. Gen. Lawson Sanders, commanding general of the 4th Marine Air Wing, accepted the surrender of the Japanese

garrison on Wake Island, site of heroic marine action in the first days of the war.

Aviation.—At the turn into 1945, the 1st Marine Air Wing was providing close air support for army ground troops in the Philippines and the 4th Wing was carrying on its relentless neutralization raids against bypassed enemy islands in the Marshalls and Marianas. The 2d Wing was reorganizing for what was to be a major role in the Ryukyus campaign, while the 3d Wing—in command of marine aircraft in the Hawaiian area—was acting primarily as a training unit.

Marines were flying fighters, night fighters, dive bombers, torpedo bombers, medium bombers, artillery spotting planes, photographic planes, and transports. In February, marines joined their navy brethren in flying from carriers of the fleet. Administratively, these marine carrier units were under the command of the 3d Wing. Marine squadrons were operating from the *Franklin* and the *Bunker Hill* at the time those ships were severely damaged by enemy attacks.

Before the battle for Iwo Jima had ended, a marine torpedo bombing squadron (VMTB-242) was operating from that island; it was joined, as the island was secured, by a squadron of marine B-25s (VMB-612).

The Tactical Air Force (TAF), Ryukyus, which blazed the aerial way in the conquest of Okinawa and other Ryukyus islands, was comprised of the 2d Marine Air Wing and the 301st Army Fighter Wing. The TAF was commanded first by Marine Maj. Gen. Francis P. Mulcahy, who was succeeded on June 11 by Marine Maj. Gen. Louis E. Woods.

During the three-month period from April 7 to July 6, the TAF destroyed 611 enemy planes in aerial combat at the loss of only four. Of that total, 2d Wing airmen were credited with 495 enemy planes, and 301st Wing fliers accounted for 116. The missions carried out by these units ranged from support for ground troops to attacks on the home islands of Japan.

Women's Reserve.—The Marine Corps Women's Reserve entered 1945 at its peak strength of 19,000. Enlistments were being accepted only to fill small replacement needs. In January, the first contingent of women marines to go overseas by congressional authorization arrived at Oahu, Hawaii, for duty at Pearl Harbor and Ewa Field. In the next seven months, the number on duty at Oahu rose to 1,000.

Strength.—At the war's end, Marine Corps personnel totaled approximately 478,000 men and women, by far the greatest numerical strength of the corps' history. The greater part of this strength was devoted to the combat landing and defense units and their supporting troops. Of the remainder, some 118,000 were in Marine Corps aviation; 12,000 were assigned to combatant naval vessels as integral parts of the crews, and others guarded naval establishments and staffed marine posts and stations at home and abroad.

Immediately upon the surrender of Japan, the Marine Corps announced a demobilization plan, the main feature of which was release of reserve personnel according to a point system. Credit was given for length of service, sea or foreign duty, combat stars and decorations, and parenthood. Critical release scores used in the initiation of the plan were 85 points for male and 25 points for female personnel. These scores subsequently underwent a series of graded reductions.

ROBERT L. DENIC,
Brigadier General; Director, Division of Public Relations, U.S. Marine Corps.

MARINE CORPS WOMEN'S RESERVE. At the beginning of the history-making year of 1945, the first contingent of women marines destined for overseas service was in its final phases of training at the staging area at the Marine Corps Base, San Diego, Calif. On January 28, this group, consisting of 5 officers and 160 enlisted women, walked down the gangplank onto the Territory of Hawaii.

These marines were to form the nucleus of an overseas detachment of women which eventually numbered nearly one thousand. Established in their own areas at Moanalua Ridge and Ewa Air Station on the island of Oahu, they organized a motor transport unit and maintained their own military police, post exchanges, and mess halls. More important, they released combat men for the war zones by taking over in offices, control towers, radio rooms, parachute lofts, photographic laboratories, and work shops. They also released for stateside duty, or for well-deserved furlough, battle-tired veterans who had seen many months of strenuous overseas service.

Meanwhile, in the states, the Women's Reserve continued to function as before. About 40 per cent of its members were engaged in some phase of aviation. In other assignments, at camps, supply depots, air stations, and rehabilitation and training centers, they continued their duties as motor transport drivers, communications workers, electricians, welders, chemists, draftswomen, mechanics, typists, and administrative clerks.

Victory in Europe did not affect their status since almost the entire Marine Corps effort has always been concentrated in the Pacific.

In August, however, the abrupt termination of the war with Japan brought changes in activity. Official emphasis swung from the prosecution of the war to the task of putting the Marine Corps on a peacetime basis. To this end, shortly after V-J Day a point system of discharge was announced, and on September 10 the first women marines to be discharged from headquarters under that system received their final papers.

Four separation centers for the women marines were quickly established, and rehabilitation personnel were assigned to each. By early October, the machinery for group discharge was in operation.

Meanwhile, many women marines whose work had become nonessential were transferred to new assignments to aid in the demobilization of both men and women reservists. Paymaster, muster rolls, transportation, and discharge departments worked on the release machinery. The historical division compiled data on Pacific campaigns. Women marines in the casualty divisions notified the families of prisoners of war as those prisoners were released. Clerks, stenographers, messengers, and mimeograph operators on dwindling staffs labored to handle the flood of details attending the war's end.

Proud of their record, with their "mission accomplished," women marines turned once more towards their families and peacetime living. And each woman, as she prepared for civilian life, found that she could doff the uniform, but not the spirit, of the United States Marines.

RUTH CHENEY STREETER,
Colonel; Director, Marine Corps Women's Reserve.

MARINE INSURANCE. See **INSURANCE.**

MARITIME COMMISSION, United States. The wartime ship construction program of the United States Maritime Commission was curtailed immediately on the surrender of Japan. The commission's building schedule, directed increasingly in 1944 and 1945 toward production of vessels expressly for military uses or capable of being converted to war purposes, was cut by cancellation of contracts for 135 vessels, some of which were under construction. Readjustments were made to fit the changed situation and the commission began the task of fitting into the nation's peacetime requirements the huge merchant fleet that was constructed under compulsion of war.

This cessation of construction brought to a virtual close the wartime shipbuilding program that, in the period of less than four years between the attack on Pearl Harbor and the end of hostilities, had increased the cargo-carrying capacity of the United States oceangoing merchant fleet by about 400 per cent, in addition to the considerable military construction and the building of several hundred small craft.

As of Sept. 1, 1945, United States shipyards had built under direction of the Maritime Commission, 5,558 oceangoing vessels, whose aggregate deadweight tonnage was 54,630,105 tons. (Deadweight tonnage is the actual cargo-carrying capacity of a vessel, expressed in tons of 2,240 pounds.) This total included dry cargo ships of various types; tankers; wooden, steel and concrete barges; ore carriers; harbor and ocean-going tugs. Also vessels built directly for or converted to military service, including aircraft carriers, frigates, transports, hospital ships, tank carriers, oilers and tenders and special combat transport and attack ships completed by the navy on Maritime Commission hulls.

In addition to these larger types there were about 1,000 small barges and 200 power boats built under Maritime Commission supervision.

The Maritime Commission was established under provisions of the Merchant Marine Act of 1936. After surveying the nation's maritime resources the commission inaugurated a building program designed to correct the deficiencies that were disclosed, both as a means of providing water transportation for carriage of domestic and foreign trade, and of providing an auxiliary for the armed services in times of emergency.

The initial program was for 50 ships a year for a decade. Simultaneously with delivery of the first vessels under this schedule, in the summer of 1939, tension in Europe increased so greatly that unusual demands were made for American shipping, and as a security measure the construction schedule was doubled. As war engulfed Europe in 1940 the schedules were redoubled and again in 1941, with the advent of lend-lease and a great toll of British shipping being taken by Axis raiders, the schedule was again doubled.

It was in 1941 also that the Liberty ship was put into production, and the first deliveries of these mass assembled ships were made in December. The methods and techniques developed in succeeding months to build these vessels were the principal reasons for the enormous production of ship tonnage that came in 1942 and 1943. The ships and tonnage produced in Maritime Commission shipyards increased in this way:

Year	Liberty* ships	Other vessels	Total vessels	Dwt. tonnage
1939	0	28	28	341,219
1940	0	54	54	638,037
1941	2	101	103	1,159,765

Year	Liberty* ships	Other vessels	Total vessels	Dwt. tonnage
1942	542	218	760	8,091,833
1943	1,232	717	1,949	19,270,746
1944	720	1,066	1,786	16,447,368
1945 (to Sept.)	104	774	878	8,681,140
	2,600	2,958	5,558	54,630,106

*Does not include 60 built for Great Britain, or any Liberty ship conversions or modifications from the original dry cargo types.

In the above table there can be traced the influence of world events and the course of the war upon the Maritime Commission's construction schedules. The first of the commission's C-types, the original long range designs, were delivered in June 1939. That year 28 vessels of all types were delivered. Production continued at about the same pace in 1940, but was almost double in 1941, after acceleration had gotten well under way.

The immediate effect of the Liberty program can be seen in 1942. The year's production soared to seven or more times that of 1941, and in 1943 the original construction goal of 16 million deadweight tons of shipping for the year was exceeded by three million tons.

After putting almost 3,000 new vessels afloat by the end of 1943, and with indications of permanent improvement in the rate of losses by enemy action, the commission felt itself enabled to curtail the building of Liberty ships and devote more of its time and facilities to production of faster cargo vessels and tankers and special vessels for the needs of the armed services.

As a result of this policy the number of vessels and deadweight tonnage produced in 1944 is not as high as 1943. This was not, however, an indication of lessened work or decreased schedules. It was rather a reflection of the construction of larger units of more complicated design and the building of vessels for military purposes, which have little deadweight carrying capacity.

The number of oceangoing merchant vessels under control of the War Shipping Administration, as of Nov. 1, 1945, was 4,442, aggregating about 46.8 million deadweight tons. More than 240,000 officers and men were in merchant service on that date, a force that had grown from about 55,000 at the time of Pearl Harbor.

The War Shipping Administration was created in February 1942 and empowered to requisition all American flag oceangoing merchant vessels except those under jurisdiction of the armed services, and all enemy vessels in United States ports; to control all United States ocean shipping except that under military control; and to act as representative of the United States in directing United Nations shipping in the interest of the war.

This last function was pursued by a coalition of the powers of the War Shipping Administration with those of the British Ministry of War Transport in a Combined Shipping Adjustment Board, which directed from Washington and London the strategic movements of Allied merchant vessels. As the war progressed and conditions changed, a set of "Principles" was agreed to in August 1944 by several of the members of the United Nations to govern international shipping until after the defeat of Japan. These principles were put into effect in May 1945 and were to be in effect six months after termination of hostilities in the Pacific, unless there was earlier agreement to disband them.

E. S. LAND,

Vice Admiral, U.S.N. (Ret'd), Chairman, U.S. Maritime Commission and War Shipping Administrator.

MARQUESAS ISLANDS. See FRENCH OCEANIA.

MARSHALL, George Catlett, United States Army officer; b. Uniontown, Pa., Dec. 31, 1880. As the United States Army's chief of staff, General Marshall directed the army's development from a force of less than 200,000 men in 1939 to a vast global organization with an operating strength of about 8,300,000 men at the end of the European war in May 1945. Throughout both the European and Pacific wars, he was a pivotal member of the Joint and Combined Chiefs of Staff and a participant in all the great Allied military conferences. In his third and last biennial report to the nation (released Oct. 10, 1945) on the progress of the Second World War from July 1, 1943, to June 30, 1945, he warned the American people that "the only effective defense . . . is the power of attack"; that the "nation's destiny clearly lies in a sound permanent security policy" based upon two essentials—intense scientific research and development and maintenance of a permanent peacetime citizen army. In late October 1945, General Marshall appeared before the Senate Military Affairs Committee in support of the War Department's proposal to consolidate the United States Army, Navy, and air groups into a single department of armed forces. On November 20, his resignation as chief of staff and the appointment of Gen. Dwight D. Eisenhower, as his successor, was announced by President Truman. On November 26, he relinquished his office, with a salute from the President as "the man to whom the nation owes its World War II victory and its future." An estimated 20,000 persons gathered in the Pentagon Building in Washington, D.C., to say farewell and to witness his acceptance of the oak leaf cluster in lieu of a second Distinguished Service Medal for "victory." On November 27, General Marshall was appointed President Truman's special envoy to China, with rank of ambassador, replacing Patrick J. Hurley. He left for his new post December 15.

Unable to obtain an appointment to West Point, General Marshall attended the Virginia Military Institute, entered the army upon graduation and thereafter was graduated from the Infantry-Cavalry School, and the Army Staff College at Leavenworth, Kans. In the First World War, he saw action with the 1st Division in France, was later selected by General Pershing to be chief of operations for Gen. Hugh Drum's First American Army. He served in China from 1924 to 1927, becoming in the latter year, an instructor at the Army War College. From 1927 to 1932, he was assistant commandant of the Infantry School. In July 1933, he joined the General Staff as chief of the War Plans Division; was deputy chief of staff of the United States Army, 1938–39; acting chief of staff, July–September 1939; and on Sept. 1, 1939, became chief of staff with the rank of general. In December 1944, he was named general of the army, following congressional legislation creating that new rank. General Marshall's military awards include the Distinguished Service Medal (First World War), Victory Medal with five bars, Croix de Guerre with palm, and Order of Suvorov, 1st degree (USSR). See also section on *General Marshall's Report* under WORLD WAR, SECOND.

MARSHALL ISLANDS. See JAPANESE SOUTH SEA ISLANDS.

MARTINIQUE, mār'tī-nēk'. French colony of the West Indies having an area of 385 square

miles and a population (1944 estimate) of 255,000. It is administered by a governor, assisted by a Privy Council, and is directly represented in the French Chamber by a senator and two deputies. An elected general council votes the budget, and municipal councils administer the 32 communes into which the colony is divided. Pupils in the primary schools number 33,260 (1938), and there is a co-educational lycée, a high school, a commercial school, and a law school, mostly at Fort-de-France, the capital and chief city (pop. 53,000—estimate 1943). Sugar and rum are the chief products. Cacao, pineapples, bananas, coffee, tobacco, and vanilla are also grown. Sugar factories and distilleries are the principal industrial establishments. The sugar mills, which operate their own narrow-gauge railroads, were reported in 1945 to be having difficulty in obtaining equipment, their locomotives, freight cars, and repair parts not being interchangeable because each railway has a different gauge. Because of the island's dependence on the sugar crop, furthermore, and because of its lack of fuels and minerals, the inhabitants of Martinique have to import much of their food and fuel, medical supplies, building materials, and other manufactures. The last prewar budget, for 1938, was estimated at 120,000,000 francs.

MARYLAND. South Atlantic state, United States; one of the original thirteen states. Population (1940): rural, 740,893; urban, 1,080,351; total, 1,821,244. Land area, 9,887 square miles, divided into 23 counties and the independent city of Baltimore, which has the status of a county. Chief cities, with 1940 populations: Baltimore, 859,100; Cumberland, 39,483; Hagerstown, 32,491; Frederick, 15,802; Salisbury, 13,313; Annapolis, the capital, 13,069.

Chief State Officers, 1945.—Governor, Herbert R. O'Connor; secretary of state, William J. McWilliams; treasurer, Hooper S. Miles; comptroller, J. Millard Tawes; attorney general, William Curran.

Judiciary.—Chief justice of the Maryland Court of Appeals, Ogle Marbury; associate justices, Edward S. Delaplaine, Stephen R. Collins, C. Gus Grason, Ridgely P. Melvin, William L. Henderson, Charles Markell.

Legislature.—The state General Assembly (Senate, 29 members; House of Delegates, 123) convenes biennially on the first Wednesday in January in odd years.

Education.—Public elementary schools (1944-45), 943; teachers, 5,838; pupils, 218,525; average yearly salary of elementary school teachers, \$1,931. Public junior high schools (Baltimore City), 20; teachers, 766; students, 20,008. Public senior, senior-junior, and regular high schools, 188; teachers, 2,439; students, 57,637; average yearly salary of public junior and senior high school teachers, \$2,307. Education in Maryland is compulsory for all children between the ages of 7 and 16, inclusive; children from 14 to 16 years may be excused from school attendance if regularly and lawfully employed in Baltimore City, provided they have completed the elementary school of 6 grades. There are five state teacher training colleges, two of them for colored students. The following receive financial aid from the state: the University of Maryland, College Park and Baltimore; Princess Anne College (Negro), Princess Anne; Johns Hopkins University, Baltimore; Washington College, Chestertown; St. Johns College, Annapolis; Western Maryland College, Westminster; Morgan State

College (Negro), Baltimore; St. Mary's Female Seminary Junior College, St. Mary's City. State superintendent of schools, Thomas G. Pullen, Jr.

Finances.—Following is a statement of Maryland's finances for the fiscal year 1944-45, supplied by the state treasurer's office:

Balance in treasury, beginning of fiscal year 1944-45	\$ 29,863,452.63
Receipts, 1944-45	72,974,253.24
Total	\$102,837,705.87
Disbursements, 1944-45	73,482,881.29
Balance, beginning of fiscal year 1945-46	\$ 29,354,824.58

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.)	16,333	17,150	17,242
Oats (1,000 bu.)	1,052	1,170	1,221
Buckwheat (1,000 bu.)	102	120	132
Wheat (1,000 bu.)	7,465	8,906	7,605
Barley (1,000 bu.)	1,575	2,174	2,070
Rye (1,000 bu.)	240	319	270
Hay:			
Clover and Timothy (1,000 tons)	343	295	398
Tame (1,000 tons)	514	486	632
Sweet potatoes (1,000 bu.)	1,134	1,280	1,280
Tobacco (1,000 lb.)	28,325	32,160	23,100
Potatoes (1,000 bu.)	2,612	1,824	2,231
Apples (1,000 bu.)	1,829	1,863	795
Peaches (1,000 bu.)	391	602	312
Grapes (tons)	425	250	100

MASCAGNI, Pietro, Italian composer: b. Leghorn (Livorno), Italy, Dec. 7, 1863; d. Rome, Aug. 2, 1945. Mascagni won international fame in the early 1890's with *Cavalleria Rusticana*, a melodramatic one-act opera which still remains a popular favorite in the repertoire today. Mascagni's father, a baker, intended that his son should be a lawyer and discouraged the boy's attempts to learn music, but young Mascagni studied secretly with Alfredo Soffredini at the Institut Luigi Cherubini. Later adopted by his uncle, Mascagni devoted himself in earnest to music and in 1879 his Symphony in C minor and a *Kyrie* were performed. In 1881 a cantata, *In Filanda*, was favorably mentioned in a prize competition sponsored by the International Exhibition of Music in Milan. His next composition, a setting of a translation of Schiller's *Ode to Joy*, was so successful that a wealthy nobleman offered to pay for his education at the Conservatory of Milan. Mascagni studied there with Ponchielli and Saladino, but he found the regular course of study too restricting and joined a travelling opera company as conductor, later settling at Cerignola, near Foggia, where he gave piano lessons and managed the Municipal School of Music. In 1889 the publishing company of Sonzogno offered awards for the best operatic composition, and Mascagni's *Cavalleria Rusticana*, based on a story by Giovanni Verga, and written in eight days and nights, won first prize. One of the leading products of the *verismo* or realist school, *Cavalleria Rusticana* was first presented at the Constanzi Theater in Rome on May 17, 1890, and won the composer 40 curtain calls and subsequently the Order of the Crown. The opera was produced in Berlin in 1890; in London and New York in 1891; and in Paris in 1892. Mascagni's 14 later attempts to repeat this success proved futile, although *L'Amico Fritz* (1891), *Iris* (1898), and *Le Maschere* (1901) were fairly popular. His other operas include

I Rantzau (1892); *Guglielmo Ratcliff* (1895); *Silvano* (1895); *Zanetto* (1896); *Amica* (1905); *Isabeau* (1911); *Parisina* (1913); *Lodoletta* (1917); *Il Piccolo Murat* (1921); *Nerone* (1935); and the operetta *Si* (1919).

MASSACHUSETTS. New England state, United States; one of the original thirteen states. Population (1940): rural, 457,245; urban, 3,859,470; total, 4,316,721. Land area, 7,907 square miles, divided into 14 counties. Principal cities, with 1940 populations: Boston, the capital, 770,816; Worcester, 193,694; Springfield, 149,554; Fall River, 115,428; Cambridge, 110,879; New Bedford, 110,341; Somerville, 102,177; Lowell, 101,389; Lynn, 98,123.

Chief State Officers, 1945.—Governor, Maurice J. Tobin; lieutenant governor, Robert F. Bradford; secretary of state, Frederic W. Cook; treasurer, John E. Hurley; comptroller, Francis X. Lang; attorney general, Clarence A. Barnes.

Judiciary.—Chief justice of the state's supreme judicial court, Fred T. Field; associate justices, Henry T. Lummus, Stanley E. Qua, Arthur W. Dolan, James J. Ronan, Raymond S. Wilkins, John V. Spalding.

Legislature.—The state's chief legislative body, the General Court (Senate, 40 members; House of Representatives, 240) convenes annually on the first Wednesday in January.

Education.—Public elementary schools (latest report, 1943-44 school year), 1,887; teachers and other school officials, 13,549; pupils, 348,562; average yearly salary of elementary school teachers, \$2,017 (est.). Public junior high schools, 169; teachers and other school officials, 4,000; students, 89,865; public senior high schools, 271; teachers and other school officials, 6,519; students, 130,132; average yearly salary of junior and senior high school teachers, \$2,403 (est.). Education is compulsory for all children between the ages of 7 and 16, inclusive. There are nine state teachers colleges, and the Massachusetts School of Art. These schools and Bradford Duffee Textile School, Fall River Textile School, Lowell Textile School, and the Massachusetts Maritime Academy receive financial aid from the state. Total state appropriation for regular public, day school education (1943-44), \$5,855,915; appropriation by cities and counties, \$66,452,683.

Finances.—Following is a statement of finances for the fiscal year 1944-45, supplied by John E. Hurley, state treasurer:

Balance in treasury, beginning of fiscal 1944-45	\$ 40,750,301.55
Receipts, 1944-45	235,986,047.66
Total	\$276,736,349.21
Disbursements, 1944-45	229,560,080.72
Balance, beginning of fiscal year 1945-46	\$ 47,176,268.49

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.)	1,677	1,763	1,849
Oats (1,000 bu.)	183	165	192
Hay:			
Clover and timothy (1,000 tons)	347	252	367
Tame (1,000 tons)	502	404	583
Tobacco (1,000 lb.)	7,965	9,381	9,170
Potatoes (1,000 bu.)	2,474	3,120	3,240
Apples (1,000 bu.)	2,550	2,747	574
Grapes (tons)	415	250	150

MAURITANIA. See FRENCH WEST AFRICA.

MAURITIUS. An island in the Indian Ocean, 600 miles east of Madagascar and 2,000 miles southwest of Ceylon, a British colony. The area of Mauritius is 720 square miles, and the population (1941 est.) 408,392; dependent islands, the largest of which is Rodrigues, have a combined area of 87 square miles and a population of 13,024. The indigenous population of Creoles (descendants of 18th-century French planters) is far outnumbered by Indian migrants, while English people are in a distinct minority; there is also a Chinese community. Both French and English are official languages, the former being in more general use; French law, based upon the *Code Napoléon*, has been preserved. Fort Louis (pop. 57,803), on the northwest coast, is the capital and principal seaport; it is unhealthy for whites, whose principal residential area is on the central plateau at Curepipe, 16 miles distant. The governor (Sir Henry C. D. C. MacKenzie-Kennedy appointed July 5, 1942) is assisted by an Executive Council, and by a Legislative Council of 27 (8 ex officio members, 9 nominated and 10 elected on a restricted franchise). Revenue in 1941-42 amounted to 23,661,338 rupees, and expenditure was 22,122,292 rupees.

Revision of the constitution was under discussion during 1945, when the Indian community, considering its proposed future representation inadequate, appealed to the Indian National Congress to exert pressure on its behalf. Elementary education is free but not compulsory. The government conducts 51 primary schools (enrolment of 15,680 in 1941) and gives financial assistance to 74 others conducted by religious bodies (enrolment 24,899); three quarters of the latter are Roman Catholic. The state also maintains Royal College, for secondary education, and aids 9 other secondary schools.

Of the total cultivated area of 185,775 acres, 149,525 are under sugar, about 20,000 under fiber, and 16,250 under tea, copra, and other crops. Because of a badly distributed rainfall, the tea crop in 1944 was only 1,820,900 pounds (1,930,670 pounds in 1943), the sugar crop was in excess of 400,000 tons. Two cyclones which hit the island in January-February 1945 were the worst experienced since 1892; all standard crops, vegetables, and fruits were largely destroyed, and many thousands of people were rendered homeless. During March-April an epidemic of poliomyelitis struck down an unprecedented proportion of the people, and this affliction had scarcely passed when a third cyclone, in April, did still more damage. The effect was a calamitous crop outlook for 1945. The sugar crop for 1944-45 was not expected to exceed 200,000 tons, a reduction of more than 50 per cent on the previous year's output, and it was anticipated that other production would suffer a marked decrease. During 1941-45 the British Treasury made grants to the colony totaling £11,300 for improving educational and health services and the development of agriculture.

Many of the necessities of life have to be imported from abroad. Rice and grain are obtained from India, flour from Australia and India, oxen from Madagascar, and minor imports from South Africa and elsewhere. Cotton and woolen textiles, machinery, and medicines are imported mainly from Great Britain. The metric system of weights and measures is in use; the currency is based on the Mauritius rupee, divided into 100 cents. Mauritius has a good railroad system covering most of the island (a standard gauge line totaling 106½ miles in length, and 14 miles

of narrow gauge). Motor bus services also traverse many of the 862 miles of roads.

McCAIN, John Sidney, United States naval officer: b. Teoc, Carroll County, Miss., Aug. 9, 1884; d. Coronado, Calif., Sept. 6, 1945. As commander of Navy Task Force No. 38, one of the designations of the Carrier Task Force, Third Fleet, a command he held alternately with Vice Admiral Marc A. Mitscher, Vice Admiral McCain headed his group in the operations that prepared the way for the Peleliu campaign, maintained a protective air cover over General MacArthur's invasion of Leyte, and helped to win the second battle of the Philippine Sea. He succeeded Admiral Mitscher as commander of the Carrier Task Force on Oct. 29, 1944, and headed the groups in clashes with the Japanese air force over the Philippines, in the cover of the invasion of Mindoro, in the strikes against Luzon, Formosa, and the Ryukyus, and in the final air attacks on the Japanese mainland.

McCLOY, John, United States Naval officer: b. Kingston, N.Y., 1876?; d. Leonia, N.J., May 25, 1945. One of the few men to win two Congressional Medals of Honor, and a holder also of the Navy Cross, Lieutenant Commander McCloy was a hero of the Boxer uprising in 1900, the Vera Cruz incident of 1914, and the First World War. Lieutenant Commander McCloy joined the merchant marine at the age of 15, and the navy in March 1898. He was a coxswain when he earned his first Congressional Medal of Honor in the Boxer Rebellion, "for distinguished conduct in the presence of the enemy in the battles of June 13, 20, 21, 22, 1900, while with the relief expedition under Vice Admiral Seymour (of the British Navy)." As chief boatswain, he received his second Congressional Medal for "eminent and conspicuous conduct" at Vera Cruz, where he led a flotilla of three picket launches. On Nov. 11, 1920, the Navy Cross was awarded to McCloy for distinguished service as lieutenant commander of the U.S.S. *Curlew*, a minesweeper operating in the North Sea. He wore three other navy decorations, one for service in the West Indies campaign, one for the Philippines, and another for China. The State of New York, in recognition of his valor, also presented a medal to him.

McCORMACK, John, Irish tenor: b. Athlone, Eire, June 14, 1884; d. Booterstown, County Dublin, Eire, Sept. 16, 1945. The charm of John McCormack's voice and his genial personality won for him, particularly in the concert field, a place that was supreme among tenors.

The son of a poor Irish family, McCormack attended the Marist Brothers School, and in 1896 entered Summer Hill College, County Sligo. At the age of 18 and without previous instruction he won the gold medal at the National Irish Festival (Feis Ceoil). He became a member of the Dublin Catholic Choir in 1903 and began to study seriously with the organist and choirmaster, Vincent O'Brien. The following year he sang with the choir at the St. Louis Exposition, after which he went to Milan where he studied with Sabatini. He made his debut as a concert singer at a Sunday League Concert in London on Feb. 17, 1907, and his operatic debut followed on October 15 of the same year, when he appeared as Turiddu in *Cavalleria Rusticana* at Covent Garden in London. He was so successful that in 1909 he sang at the San Carlo Opera House in Naples, and made his New York debut

on November 10, at the Manhattan Opera House, as Alfredo Germont in *Traviata*. He was subsequently engaged by the Chicago-Philadelphia Opera Company; the Chicago Grand Opera Company; the Metropolitan Opera Company; and the Monte Carlo Opera Company. He sang with Tetrizzini in London, New York, and Parma, and toured Australia in Italian opera with Melba in 1911. He toured the United States in concert in 1912 and Australia again in 1913. From that time on he devoted himself mostly to concert work, and appeared regularly on the concert stages of the principal cities of the United States, Canada, England, and Ireland. When the United States entered the First World War, he contributed his services to all kinds of patriotic purposes and through his efforts raised nearly a million dollars for all causes. In 1918 his income was estimated at \$300,000, the income from phonograph records alone amounting to \$180,000, a greater amount than the royalties received by any other two singers combined. In 1919, McCormack became a United States citizen, and in 1928 was raised to the papal peerage, with the title and dignity of count. He sang for the first time over the radio on Jan. 1, 1925, and in 1929 made the talking motion picture, *Song O' My Heart*. His retirement was marked by a farewell tour in 1938, but in 1944 he started a tour for the British Red Cross. His health broke down and he was ordered by his doctor to give up singing.

McCREERY, Sm Richard Loudon, British Army officer: b. Feb. 1, 1898. Lieutenant General McCreery commanded the British Eighth Army for the final phase of the Allied campaign in Italy, November 1944-April 1945. He launched the Eighth's spring offensive on the Adriatic side of the front on April 10. There followed in rapid succession the Eighth's capture of Argenta on April 18; of Bologna, with Truscott's American Fifth, April 21; of Ferrara, key to 6 potential escape routes for von Vietinghoff's forces, April 24. McCreery's men took Genoa on April 27 and Venice on April 29, the same day on which all Nazi troops surrendered unconditionally in Italy, and southern and western Austria. On May 1, troops of his New Zealand Division effected a junction with Marshal Tito's Yugoslav forces at Monfalcone, and 2 days later, occupied the port of Trieste. General McCreery assumed command of the British Eighth Army in early November 1944, replacing Lieut. Gen. Sir Oliver Leese. His Second World War record includes service in France (1940); in the Middle East as chief of the general staff (1942); and Tunisia (1943). He is a product of Eton and Sandhurst, and in the First World War, saw service in France, 1915-17, and again in August-November of 1918.

McGUIRE, Thomas B., Jr., United States Army Air Force officer: b. Paterson, N.J., Aug. 1, 1921; d. in action over the Philippines, Jan. 7, 1945. At the time of his death, Major McGuire was the leading American active ace with 38 Japanese planes to his credit. In a letter from Lieut. Gen. George C. Kenney, commanding the Allied Air Forces in the Pacific, to the flier's widow it was indicated that an accident in some way disabled Major McGuire's plane, making him an easy prey to defending enemy fighters. He became the leading ace when Maj. Richard I. Bong, credited with downing 40 Japanese planes, returned to the United States on leave.

McNARNEY, Joseph Taggart, United States Army officer: b. Emporium, Pa., Aug. 28, 1893. On Nov. 20, 1945, General McNarney was appointed commanding general, United States Forces in the European theater; commander in chief, United States Forces of Occupation in Germany; and United States representative on the Allied Control Council for Germany. In this three-fold job, he replaced Gen. Dwight D. Eisenhower. General McNarney had previously served as acting Allied supreme commander in the Mediterranean theater. He is a graduate of the United States Military Academy, 1915; the Air Corps Tactical School, 1921; the Command and General Staff School, 1926; and the Army War College, 1930. In the First World War, he was attached to the air service overseas. His promotion to the rank of full general (temporary) was confirmed March 28, 1945.

MEASLES. See **MEDICINE**.

MEAT PACKING. Total meat production in the United States in 1945 from all sources was about 22,500,000,000 pounds. Of this amount, the meat packing industry handled about 17,600,000,000 pounds, with total sales of \$5,000,000,000. More than 4,000 meat packers, large, medium and small, purchased in 1945 live animals for meat from 5,000,000 farmers and ranchers who received cash for their livestock the day of sale. Until V-E Day, May 8, meat packers operating under federal inspection set aside substantial proportions of their total meat production for government use. During the middle of the year, the United States armed forces consumed about 72 million pounds of meat weekly. Just to carry this much meat to camps or seaports would take 18 freight trains, each 100 cars in length. During the year government meat requirements for the armed services and other war services, including lend-lease, was about one-third of all meat produced under federal inspection, or one-fifth of the total production of meat from all sources. For the first eight months of the year, the meat packing industry continued to operate under 75 government regulations and 1,200 amendments. Soon after V-J Day, many of these regulations, such as meat set-asides, were adjusted or completely eliminated, making more meat available for consumers.

Meat packers slaughtering hogs in 1945 found that pork production per hog was above that for the previous year, and above the average for the 1936-1944 10-year average. The amount of beef produced by federally inspected packers in January, February and March of 1945 was 9 per cent more than in the same period in 1944. Beef production in April, May and June was 9 per cent greater than in those same months in 1944. The average increase in beef production the last six months of 1945 was 10 per cent, compared with the same six months of 1944.

With the exception of January, veal production in meat packing plants under federal inspection was from 15 to 27 per cent lower, respectively, for the other eleven months of 1945, compared with 1944. Meat packers slaughtering sheep and lambs from January through June under federal inspection dressed 12 per cent more lamb than during the first six months of 1944. The last six months of 1945 showed decreases ranging from 12 to 20 per cent, respectively, compared with the same six months of 1944.

Civilian meat consumption per capita in 1945 was estimated at about 135 pounds. This com-

pares with the per capita consumption in 1944 of 150 pounds, and with the 5-year 1935-39 average of 126 pounds. Meat allocations for October, November and December of 1945 by the United States War Meat Board will allow civilians an annual average per capita rate of almost 148 pounds. If meat supplies were available, however, the civilian demand based on OPA ceiling prices would be approximately 165 pounds per person.

The civilian allocation of 4,847,000,000 pounds of meat for the fourth quarter of 1945 is nearly 30 per cent more than was allocated to them for the third quarter in 1945. This increase in civilian allocation was made possible by reductions in military requirements and the seasonal increase in livestock marketings. Compared with the same quarter a year ago, the United States military allocation of 764,700,000 pounds is a reduction of more than 50 per cent from the amount allocated to this outlet and other war services for the same months in 1944.

With the fulfillment of V-E Day and V-J Day, the meat packing industry had practically no reconversion problem. What uncertainties there were in unemployment in meat packing grew out of the seasonal variations in the flow of livestock from the farms and ranches to the market centers and slaughter houses.

The meat packing industry afforded jobs in 1945 to approximately 250,000 persons. The element of security and the stability of employment ranks high. During 1945, more exclusive meat items for the armed forces and other war services were developed by meat packers and food technicians of the subsistence laboratory of the U.S. Quartermaster Depot. During the entire period of the war these new meat items totaled 50. Included among these were such foods as dehydrated corned beef hash, dehydrated meat and rice, dehydrated pork, canned pork and apple sauce, canned ham and sweet potatoes, canned meat balls and spaghetti, and scores of other foods. Undoubtedly, some of these new meat, and meat and other foods items will be packed for civilians when the army no longer requires them exclusively.

Scientific development has made great strides in the last year in the development of research work on frozen and pre-packaged meats. Among the greatest contributions of the meat industry to the war effort in 1945 was the further development of three-way, frozen boneless beef. Briefly, this called for removal of all bones from whole sides of beef, dividing the remainder into three types of cuts: for roasting and broiling, for braising and stewing, and for ground beef. Each of these three types of beef was packed in boxes weighing around 50 pounds each, and quick frozen to seal in the natural juices and preserve the natural color. Packing beef in this form saved space in shipping and storage.

New by-products of packinghouse products developed, as well as refinements of some of those already being marketed, were features of the scientific development which has characterized the industry in the past decade.

JOHN CUTTING,
American Meat Institute.

MEDICAL INSURANCE. See **INSURANCE**.

MEDICINE, Progress in. During the past year, as in other recent years, most of the important advances in the field of medicine have occurred along lines which are of paramount importance to the medical services of the armed forces. In the

AMERICANA ANNUAL for 1944 it was pointed out that medical research had received an enormous impetus during the years of the Second World War, due to the mobilization of medical manpower, the co-ordination of research facilities, the allocation of federal funds, and the unusual opportunities which the organization of the armed forces provides for the gathering of medical data on a large scale. Such factors have accelerated the pace of medical research and expedited the solution of problems in this field just as identical factors made possible the development of the atomic bomb in a space of time which would have been considered impossible shortly before the war. This acceleration of scientific research during the war years has been widely recognized, and as a consequence, there is at present pending in the 79th Congress considerable legislation designed to perpetuate into the postwar period some sort of federal control of research activities like that which seems to have been so productive of good during the war years. It is projected that such control would include the field of medical research as well as the field of national defense and the physical sciences, such as chemistry. Leaders in medicine recognize the values which such control might have, but fear that these might be outweighed by the defects inherent in any system of federal control, such as political or bureaucratic domination, suppression of private initiative, and loss of individual freedom of action.

Antibiotics.—The discovery that a mold, penicillium, produced a substance, penicillin, which would destroy bacteria within the human body, and thus cure diseases due to bacteria, inaugurated a new era in the treatment of infections. Almost everyone has by now heard of penicillin. It is less generally known that penicillin is only one of a large number of substances which have been isolated from molds and shown to have potent actions against bacteria. Such substances have also been derived from bacteria and found to have powerful effects against other bacteria. In a recent review of this subject, 30 antibiotics, as these agents are called, were listed. Most of these have already been found unsuitable for use in human disease because they exert serious toxic effects as well as antibacterial ones. Some of them, such as *gramicidin*, derived from a bacillus found in soil, are too toxic to be administered internally but may be applied with good effect externally, as in the treatment of skin infections. As yet no other antibiotic has even approached penicillin in general value in the treatment of human disease. Most of these substances are still in the process of investigation and have not yet been tried in treatment on any wide scale. This whole field is still in its infancy and it is hoped that as time goes on it will provide many therapeutic agents of great value to suffering humanity. As Sir Alexander Fleming, the discoverer of penicillin, has himself remarked, it would be remarkable indeed if the first useful antibiotic to be discovered, penicillin, should be the last, or even the best.

Penicillin.—In the AMERICANA ANNUAL for 1944 the new drug for the treatment of bacterial infections, *penicillin*, was discussed briefly. At that time our knowledge of this therapeutic agent was in its formative stage, since supplies of the drug were sharply limited due to difficulties in its production. Moreover, use of the drug had been restricted to certain conditions of paramount importance in the armed forces. During the past year methods and facilities for the manufacture of

penicillin have been so improved that this medicine is now available in unlimited quantity to both the armed forces and the civilian population. It has been used on a huge scale in the treatment of disease and our knowledge of it has advanced so rapidly that it is already possible to make a fairly definitive statement about it.

Penicillin is now prepared for clinical use in the form of highly purified and concentrated sodium and calcium salts. In order to assure the antibacterial effects of the drug in the living organism, it is necessary to maintain a concentration of penicillin in the blood. Since a single dose of the drug is absorbed almost immediately from the site of injection and completely excreted from the body by way of the urine in between 2 and 4 hours, it is necessary to give doses every 2 or 3 hours throughout the duration of treatment in order to maintain a proper concentration in the blood. At the present time it is considered desirable to give each dose by intramuscular injection, since penicillin is rapidly destroyed by the acid in the stomach; only a small proportion of the drug reaches the intestine, where it can be absorbed, when the drug is given by mouth. A year ago it was considered that the oral route of administration might always remain an impractical one, due to the difficulty just cited. However, it has been shown more recently that satisfactory concentrations of drug in the blood may be obtained if really huge doses of penicillin are taken by mouth. The oral dose necessary for a proper effect must be at least five times as much as an intramuscular dose which gives the same effect. This makes the cost of treatment by the oral method excessive as compared with the intramuscular at the present time. Just now the cost of penicillin for the treatment of a serious infection by the intramuscular route is about one dollar and fifty cents a day. It seems likely that oral dosage with penicillin will replace intramuscular administration in the near future. This would be perfectly feasible if either the cost of the drug is further reduced or if some method of enhancing the absorption of the drug following oral administration is discovered. Up to the present time attempts to achieve the latter by administering the penicillin along with oil, antacids, and other chemicals have been disappointing. It is interesting to note that penicillin has been administered with good effect in the treatment of lung infections in the form of a vapor which the patient inhales.

As can be imagined, the injection of penicillin deep into the muscles, such as those in the hip region, at intervals of two hours day and night over a period of many days, and often over one of several weeks, becomes very distasteful to the patient. He often objects to being a pincushion early in the course of treatment and almost always does so soon or late as it continues. In order to avoid the nuisance of such frequent injections attempts have been made to prolong the action of single injections. For example, it has been found possible to administer simultaneously with the dose of penicillin another drug which will retard the excretion of penicillin by the kidneys and thus prolong the presence of the drug in the blood for as long as 6 hours after a single dose instead of 2 hours. In like fashion, penicillin has been injected in a mixture of beeswax and peanut oil, which slows the absorption of the penicillin from the site of injection into the blood stream so that effective concentrations of the drug persist for 6 to 7 hours. Methods of prolonging the action of injections of penicillin are still in the experimental

stage and it is not possible to say at present which will prove the most useful.

Penicillin constitutes the treatment of choice for infections due to the streptococcus, the staphylococcus, the pneumococcus, the gonococcus, the gas gangrene bacillus, the anthrax bacillus, and the organisms which cause trench mouth and Vincent's angina. These bacteria are the ones which cause the great bulk of serious infections in humans, such as wound infections, serious skin infections, pneumonia, meningitis, empyema, septicemia, child bed fever, abscesses, and acute infections in the ears, sinuses, and throat. Penicillin is also very effective against the meningococcus, the common cause of meningitis, but it is not clear at present whether penicillin is to be preferred to the sulfonamide drugs in this disease. Penicillin has also been found effective against syphilis, diphtheria, a serious type of fungus infection called actinomycosis, and rat bite fever, but its value in these conditions requires further evaluation. For example, penicillin appears to give a rapid and complete cure of syphilis in its early stages, but it is not certain as yet whether such a cure is permanent as it is with the older methods of treatment with arsenic and bismuth. Penicillin is not effective against certain infections due to bacilli which are readily cured with the sulfonamide drugs. These infections would include those due to the colon bacillus, the commonest invaders of the urinary tract, bacilli which cause common types of dysentery, the influenza bacillus, and the bacillus which causes chancroid. Like the sulfonamide drugs, penicillin has no value against typhoid fever, tuberculosis, undulant fever, or any of the diseases due to viruses such as measles, infantile paralysis, the common cold, and grippe, and no value in any disease which is not due to infection.

As yet the mode of action of penicillin, the manner in which it cures infections, is not entirely clear. It seems likely, as is the case with the sulfonamide drugs, that penicillin interferes in some way with the essential life processes of the bacterial cell. Penicillin acts against bacteria much more rapidly than do the sulfonamide drugs, suggesting that it may actually kill the germs rather than merely stopping them from multiplying as the sulfonamides do. However, this point is still somewhat obscure.

When penicillin was first being used it was hoped that it would prove entirely free of any undesirable side actions such as the toxic effects which constitute a nuisance in the use of the sulfonamide drugs. It is already apparent that this hope will not be wholly justified. As yet no frequent or really serious toxic effects from penicillin have been observed, but it is quite apparent that the drug occasionally causes fever, hives, skin rashes, joint pains, and possibly neuritis. However, the common toxic reactions which follow the sulfonamides, and which made it necessary for patients receiving them to have frequent examinations of the blood and urine and other laboratory tests, have not been observed.

In summary, we may state that penicillin has proved an equally effective treatment for most of the infections which are susceptible to sulfonamide treatment with the advantages that it lacks the serious toxic effects of the sulfonamides, and that it is effective against a number of serious, common infections against which the sulfonamides have little or no effect. This additional value of penicillin is most notable in the instance of staphylococcus infections, such as osteomyelitis with blood stream infection, and in that of bacte-

rial endocarditis. This deadly infection of the heart valves was formerly universally fatal. With the sulfonamide drugs perhaps 10 per cent of patients with bacterial endocarditis were saved but with penicillin the recovery rate is at least 50 per cent and possibly as much as 75 per cent.

Streptomycin.—One of the most interesting antibiotics discovered so far is *streptomycin*, an extract from a mold prevalent in soil, streptomycetes. This substance has been found highly effective in the test tube against a variety of infections which are completely resistant to treatment with either penicillin or sulfonamide drugs, and which include the typhoid bacillus, the tuberculosis bacillus, and the bacillus which causes tularemia. Streptomycin has already been shown to have value in the treatment of such infections in animals and it is hoped that similar effects will be observed in human infections. Trial of streptomycin in human diseases is now under way. Unfortunately the results of such treatment are not available in any quantity at the time of this writing.

Infectious Jaundice.—A fairly common illness familiar to many by reason of personal experience consists of vague abdominal discomforts, loss of appetite, nausea, a sense of fatigue, and jaundice, or yellow discoloration of the skin and the whites of the eyes. This illness, which commonly persists for a few weeks, following which complete recovery occurs, has long been known as "catarrhal jaundice." This name was given to the disease because physicians have for generations considered that this condition is due to a catarrh of the bile ducts which obstructs the drainage of bile from the liver just as a cold in the nose results in obstruction of drainage from that organ. For years it has been recognized that epidemics of this type of jaundice might occur, particularly during wartime conditions of crowding. During the Second World War such epidemics of jaundice occurred in large numbers, affording an opportunity for study which has given us an entirely new body of knowledge concerning this disease. It has been discovered that this type of jaundice is due to infection with a filterable virus which causes a generalized inflammation of the liver. Experiments on human volunteers have shown that the disease may be contracted by the ingestion of food, water, or other substances which have been contaminated with the excreta of a person suffering from the infection, which thus appears to be spread in much the same fashion as typhoid fever. There is also proof that the disease may be contracted by inoculation with blood serum obtained from an individual suffering with the infection. The most notable epidemic of jaundice in history occurred in the early days of the Second World War, affecting military personnel. More than 11,000 cases appeared among troops stationed in the western region of the United States alone. It was quickly noted that all the men affected by the jaundice had been vaccinated with certain lots of yellow fever vaccine. This vaccine had been made with human serum, and it is now understood that some of this serum was unknowingly derived from individuals who had the causative virus of infectious hepatitis in their blood. As might be expected, when yellow fever vaccine prepared with this infected serum was administered on a large scale, thousands of cases of jaundice resulted. In this instance an even worse epidemic was prevented only by the prompt and intelligent action taken through the Office of the Surgeon General of the Army which quickly

solved the problem and terminated the difficulty. At present yellow fever vaccine is prepared without the use of any serum from human beings and individuals may be vaccinated without any danger at all.

Carefully controlled studies of the treatment of infectious jaundice have shown that two things are of paramount importance. These are rest in bed and the consumption of liberal amounts of food including fat, protein, and starches. All the medicines tried, including intensive vitamin therapy, have proved disappointing. With rest and a liberal diet practically all cases of infectious jaundice recover completely. In less than one half of 1 per cent the disease is fatal, and of those who survive, less than 5 per cent show any permanent damage to the liver.

Control of Airborne Infection.—Recent years have brought important advances in our knowledge of how to control the spread of diseases which are disseminated through the air we breathe. It has been known for a long time that many respiratory infections, such as streptococcal sore throats and influenza, the common cold, measles, whooping cough, and pneumonia are contracted by inhaling air which contains tiny droplets of saliva expelled by the breathing, coughing, or sneezing of an infected individual. It has usually been considered that this type of infection occurred only when the contagious individual coughed or sneezed in close proximity to his victim. Recent studies have shown that this need not be the case at all, and that the air in the vicinity of a contagious individual is not only contaminated for a considerable distance, but also remains contaminated for some time after the individual has left the immediate vicinity. This latter phenomenon has been explained by the demonstration that bedclothes, floor dust, and other materials may become impregnated with bacteria or viruses by an ill person, and function as a reservoir from which infectious material blows into the air, where it may be inhaled and reproduce infection. In a study made in an army barracks it was found that each cubic foot of air contained 15 to 20 of a virulent type of streptococcus, and that 100,000 of the same organism could be found on a single sheet or blanket. Moreover, it was observed that the frequency of illnesses due to streptococci was proportional to the number of the bacteria in the air.

Such facts might be horrifying were it not that remedies for them have already been found. The regular use of oil on the floor, which prevents the dispersal of dust, and the treatment of bedclothes with an emulsion which reduces the dispersal of dust and lint, practically obliterates the danger of contamination of the air from such reservoirs of infection. Furthermore, it has been found that air containing germs may be very effectively sterilized in one of several ways. This may be done by the use of ultraviolet lights, or by impregnating the air with a germicidal gas which is harmless to humans. A vapor made from the chemical triethylene glycol has been found very useful for this purpose. It seems unlikely that measures such as those outlined above for the control of airborne infection will ever be necessary or practicable in the home. On the contrary it is considered that they may find a wide use in environments such as schools, theaters, and hospital wards where the herding together of individuals exposes the entire group to infection with some illness existing in a single member. It has already been proved that the use of ultra violet irradiation of air in a school prevented the

epidemic spread of contagion in one department of the school although it occurred freely in the other departments where no attempts at prevention were made.

Human Blood Fractionation.—The global war caused an enormous demand for human blood and blood substitutes to combat the hemorrhage and shock which so regularly result from war wounds. Early in the course of the war it became obvious that human blood in its natural state, as ordinarily used for blood transfusions, was unsuitable for use in military medicine. This was because it could not be accumulated and stored in advance, since it does not keep well for extended periods of time, and also because before every ordinary blood transfusion, the bloods of donor and recipient must be carefully matched to be sure that they are compatible and that their admixture will not cause a transfusion reaction. This matching is a procedure which requires time and special equipment.

Because of the unsuitability of whole blood, as it is called, blood plasma was tried instead. Blood consists of two components, the red blood corpuscles, and the liquid medium in which they are suspended, which is called blood plasma. The red blood corpuscles are readily separated from the plasma by allowing the whole blood to stand so that the corpuscles may settle to the bottom, following which the overlying plasma may be siphoned off. It was soon discovered that this blood plasma could be dried and a powder obtained which could be stored almost indefinitely, and that when this powder was dissolved in water again at some later date, it could be administered to patients suffering from shock with most of the beneficial effects of whole blood. As everyone knows, under the auspices of the Red Cross, the civilian population donated millions of pints of blood, from which dried plasma was prepared for the treatment of our wounded abroad. It was used for this purpose on an enormous scale, and this treatment is credited with saving thousands of lives.

Of these two primary blood fractions it is not only the plasma which is useful, for experience has shown that the red blood corpuscles which are separated from the plasma may also be used to advantage. They also can be stored for future use, although not for as long periods as the plasma, and then can be resuspended in a saline solution and injected into the veins as an effective treatment for serious anemia, just as whole blood is used for this purpose. In this connection it may be mentioned that it is the plasma fraction of blood which is effective in the treatment of shock and the corpuscle fraction which is so in the treatment of anemia. This explains why the two fractions may be used separately in the treatment of the two conditions. Naturally, whole blood is effective in the treatment of either.

Still further advances have been made in the fractionation of blood. The most important constituent of plasma is blood, or plasma, protein, which is present in two principal forms, albumin and globulin. It has long been known that the plasma albumin is formed in the liver, but it has only recently been discovered that the plasma globulin is formed in the lymph gland tissue of the body. Recent studies have demonstrated that the albumin fraction may be extracted in pure form from plasma, and that relatively small amounts of this substance, such as may be contained in a small pocket-sized vial, are effective in the treatment of shock much as are either whole blood or plasma. In this fashion the treat-

ment of shock has been made even more simple and convenient than with plasma. This plasma albumin has also been found helpful in the treatment of a number of diseases, particularly severe malnutrition, which is characterized by a pathological deficiency of the albumin in the blood, which results in serious dropsy.

The globulin fraction of the plasma protein has also proved of great interest and value, for it has been found that this substance contains the antibodies of the blood. These are an important part of the mechanism by which we resist disease and acquire immunity to it. The globulin fraction also has been isolated in pure form and it has already been proved that inoculation with some of this material will cause immunity to measles in a high percentage of cases, constituting the safest and most effective agent for this purpose that we know of today.

In addition to the albumin and globulin fractions of the plasma proteins, still other fractions exist in much smaller quantity. Of these fibrin and thrombin, both of which are important in the mechanism of the clotting of blood, have also been extracted in pure form. They have already been employed successfully as a treatment to check hemorrhage. Their value is already proved in at least two conditions where we have long lacked an effective agent for the purpose of checking bleeding. These two conditions are the oozing of blood which occurs during operations on the brain, and the serious bleeding which often persists at the site of accidental injury or surgical operation in individuals who suffer from hemophilia, a hereditary disease characterized by an abnormal bleeding tendency.

It seems probable that the blood plasma contains still other fractions which will be isolated and prove useful in the treatment of disease. Much interest is focused on this field of research, and much is hoped from it.

DDT.—In the *AMERICANA ANNUAL* for 1944 preliminary mention was made of the remarkable new insecticide DDT, the chemical composition of which was a military secret at the time of writing. It may now be revealed that this substance is dichloro-diphenyl-dichloroethane, a chemical which was first synthesized in 1874 in Strasbourg. It was first used as an insecticide in Switzerland, for the purpose of destroying agricultural pests, and it was called to the attention of the military services by the United States Department of Agriculture early in the global war when it became apparent that the control of insect-borne diseases, such as malaria and typhus fever, would be major military problems. Tests made with a variety of insects showed that DDT would kill them effectively either by being eaten or by merely coming into contact with it. The substance was put into military service and achieved a brilliant success. It has been found that DDT is marvelously effective against flies, mosquitoes, lice, bed bugs, cockroaches, ticks, chiggers and a host of other insects not directly concerned in the transmission of disease. Accordingly this agent has already become a factor of paramount importance in the control of insect-borne diseases, especially typhus fever and malaria. Moreover DDT has been proved harmless to humans and to domestic animals when properly employed. One of the most remarkable features of this substance is the duration of its action. For example, clothing dusted with it will remain immune to infestation with lice for a month, and this power to repel the lice will persist through several washings. DDT is effective when used as

a dusting powder, and it may be dissolved in kerosene for a spray, or mixed with other liquids and used as a paint. For adequate effect, insecticide mixtures must contain at least 3 to 5 per cent of DDT.

Congenital Anomalies Following German Measles.

—In 1940, an unusually severe form of German measles became epidemic in Australia, probably as the result of wartime conditions of crowding and poor hygiene. Some months later it was noted that an unusual number of babies were being born with congenital defects, particularly cataracts in the eyes and cardiac conditions. It was soon discovered that these infants came from mothers who had had German measles in the early months of their pregnancies. Closer examination of the data revealed that almost 100 per cent of the mothers who had had German measles during the first two months of pregnancy gave birth to defective children, the percentage declining as the measles occurred later in pregnancy. Within the past year the same sequence of events has been recognized in this country, also in conjunction with unusually severe epidemics of German measles probably resulting from wartime conditions. Since German measles is a very common ailment, one might well inquire why the association of congenital defects with it has never been noted previously. There seem several possible explanations for this. One might be that in normal times most females do not suffer from German measles during the childbearing period, since the disease is essentially one of childhood. Thus, normally, cases of the disease affecting a pregnant woman are so scattered and sporadic that the association of congenital defects in the offspring might well escape notice, while on the other hand in wartime the occurrence of large epidemics involving pregnant women, as well as others, provided large numbers of cases in such a short time that the phenomenon became obvious. Another possible explanation might be that the disease in question is not German measles at all, but rather some new disease which has not yet been distinguished from German measles, or that it might be German measles which has acquired exceptional virulence, as sometimes happens with infectious disease when they are passed through unusually large numbers of people. Whatever the explanation, one may well inquire how this new hazard to the unborn child is to be met. Obviously it is necessary that the pregnant woman take every precaution against being exposed to German measles. It has also been suggested that all females be deliberately infected with the disease in childhood so that having had it, they will be immune in later life when they bear children. This might be quite feasible, since the disease is a mild one from which people very rarely, if ever, become seriously ill.

Successful Vaccination Against Influenza.—Within the past year it has been announced that it is now possible to vaccinate individuals successfully against influenza with a vaccine prepared by growing the virus within eggs containing living chick embryos. This vaccination confers an immunity to the disease which is highest during the second week after vaccination, when 85 per cent of the vaccinated individuals appear immune, and which persists with considerable effect for at least six weeks. It is considered that the wholesale application of this vaccination to the population would probably cut short the spread of influenza if we should again be faced with the danger of a terrible epidemic such as oc-

curred after the First World War. At present it does not seem worthwhile to vaccinate individuals on general principles since influenza is a mild disease in normal times and becomes a serious one only in its epidemic form.

Malaria.—The recent deployment of millions of military personnel in Africa, the South Pacific, and other tropical and subtropical regions where malaria is prevalent caused this disease to be one of the major medical problems of the war and provided the greatest opportunity in history for study and elucidation of the disease. In view of this fact it is somewhat disappointing that many of the most important problems relating to it remain unsolved. For instance, no treatment has yet been discovered which will prevent relapses in the common variety of malaria. However, certain important discoveries have been made, and deserve mention here.

It is now proved fairly conclusively that when a victim is bitten by a mosquito infected with malaria, the malarial parasite lodges in the tissues of the individual and grows there for a time before it invades the blood and causes the symptoms of malaria. This explains the incubation period between being bitten by a mosquito and the development of the fever which signifies the disease and which results from huge numbers of the parasites in the blood stream. The fact that the malarial parasite lodges in the tissues also explains the tendency to relapse in malaria, since it has been shown that some parasites may persist in the tissues, and later reinfect the blood even after all the parasites in the blood have been killed by treatment.

Recent experience of the military forces with the treatment of malaria has caused a revision of our notions concerning the relative merits of the drugs effective in treatment. Atabrine, also called quinacrine, a synthetic drug long considered a poor substitute for quinine, has proved to be the most effective drug for the treatment of all three of the common varieties of malaria, and is now preferred to quinine in all instances, not only for treatment but also for prevention of infection.

Plasmochin, another synthetic drug, previously thought to have value for the prevention of relapses in malaria, has proved to have no value in this respect, but has demonstrated an unsuspected value for another purpose. When given to persons suffering from one variety of malaria, the malignant tertian type, it suppresses the parasites in their blood so that mosquitos biting these individuals are not contaminated with the disease. In this fashion, plasmochin is useful in preventing the spread of this type of malaria from person to person by mosquitos. It is now recognized that neither atabrine nor quinine is effective in preventing relapses of malarial fever, and that natural, and perhaps acquired, immunity is a more important factor in governing an individual's tendency to relapse than had hitherto been suspected. As yet, no drug has been found that will cure the disease and guarantee that no relapse will occur. The discovery of such a drug will constitute one of the great medical discoveries of all time, since it is estimated that even in peacetime more people, the world over, suffer from malaria than from any other type of serious infection.

Infantile Paralysis.—The past few years have brought important additions to our knowledge of the disease infantile paralysis, or poliomyelitis. It has been known for a good many years that this illness is caused by a virus, but the manner in which individuals became infected and in which

the disease spreads has only recently been discovered. It has been proved that infection may result when the causative virus enters the mouth and passes down the gastro-intestinal tract, and it has even been possible to isolate the virus from the stools of patients suffering from the disease. Moreover, it has been shown that the virus may be found in the stools of apparently healthy individuals who have merely been in contact with a person suffering from the disease, indicating that such individuals, who have not yet developed the disease themselves, none the less constitute a source of infection for the public. The virus has also been found in sewage, on flies, and in food which has been exposed to flies. It is thus apparent that the disease may be spread not only directly from person to person but also by flies through the medium of food, and possibly other things, which they contaminate. These findings give good hope that in the future epidemics of poliomyelitis may be prevented, or at least cut short by measures directed toward the control of flies and the avoidance of food which has not been thoroughly washed or cooked. These discoveries also explain the occurrence of epidemics of the disease in warm weather only, a phenomenon which had long been puzzling, since this is the time when flies are most prevalent.

Scrub Typhus Fever.—Early in the course of our military operations in the Southwest Pacific during the recent global conflict it became apparent that one of the serious medical problems in that theater of operations would be a serious infection to which the name scrub typhus fever has been given. As soon as this problem became evident, extensive studies were initiated by the Medical Department of the army, and these have resulted in an entirely new body of knowledge concerning a disease which previously had been merely a medical curiosity. Since the latter years of the last century it has been known that there occurred in certain river valleys in Japan and adjacent regions of Formosa a type of fever to which the name Tsutsugamushi disease was given, and that this disease was caused by a bacterial organism called *Rickettsia orientalis*, a variety of the same organism which causes typhus fever, one of the scourges of eastern Europe. Until recently it had never been understood that this disease was also prevalent in many parts of southeast Asia and the adjacent islands of the Indian Ocean, and in the Southwest Pacific islands. This has unfortunately been proved by the experience of our troops in these areas.

The disease which afflicted them is characterized by onset with fever, and general misery followed by the development of a skin rash, and, in severe cases, by evidences of brain infection, heart failure, and involvement of the liver and kidneys. The mortality of the disease ranges as high as 30 per cent in the more severe epidemics. One very characteristic feature of the disease is a sore, or scar, at the site where the infection gained admittance to the body. It has been proved that this infection always occurs as the consequence of being bitten by an insect, a mite. This mite habitually lives on the bodies of small rodents, and from them becomes attached to grass and other foliage through which these small animals pass. Thus it follows that infection with the disease commonly results from working in, or passing through, grassy and bushy areas, or areas covered with scrubby foliage. It is from this fact that the name "scrub typhus" derives. Up to the present time, no treatment has been discovered which is proved effective for the disease. A serum

and two chemicals, methylene blue and para-amino-benzoic acid, have been tried with some apparent success, but all of these require further evaluation.

This disease, scrub typhus, provides an excellent example of the manner in which the medical departments of our armed forces have solved a great variety of problems. In this instance our soldiers became ill in large numbers from a disease which had never been considered a problem in the areas where they were engaged. As soon as the problem became evident, a commission of research workers began work on it, and they speedily identified the disease with one previously considered to be of importance only in Japan, ascertained the causative organism, proved the mode of transmission via an insect, established the characteristic symptoms and signs of the illness, and initiated the trial of new methods of treatment. Accordingly, this disease is discussed here not only because much that is new has been learned about it, but also because it serves to illustrate the solution of a medical problem by the modern method of combined attack by bacteriologists, epidemiologists, and physicians at the bedside. CHARLES H. WHEELER,
Assistant Professor of Clinical Medicine, Cornell University Medical College; President, The American Federation for Clinical Research.

MELLON INSTITUTE. This institute commemorated in 1945 the 35th anniversary of the application of its methods at the University of Pittsburgh. Since 1911 the institute has pioneered paths for developing technology and public health through nonprofit scientific investigation. It has been active in cultivating the natural sciences, in improving chemical education and research, in building up chemical engineering and industrial hygiene. During the past four years it has been serving the federal government by much work of martial necessity.

Advances in Coal Chemistry.—Research veterans are investigating problems concerning bituminous coal derivatives, including the recovery of compounds from coke-oven gas, the elimination of wastes, the improvement of quality of products, and the industrial uses of these chemicals. A study of the impurities in "nitration benzene," the most important commercial grade, has been carried out. A speedy and accurate method has been composed for determining hydrocyanic acid and certain of its derivatives in gaseous, liquid, or solid state. A project attracting much effort is the recovery of thiocyanates from solutions. A new process for making guanidine nitrate has been announced.

Work on the physical constants of tar bases has laid out a map of the entire field and of the extensions that may be expected. Investigations on the rheological properties of various tar products have been continued. An important outcome has been the manufacture and introduction of a pitch compound of modified flow characteristics, suitable for the protection of metal products, such as corrugated roofing and siding, flat and V-crimp sheets, and associated constructional accessories. Other types of modified pitches that may be of interest in the development of more chemically resistant mastics are being evaluated in experimental installations. The desulphurization of naphthalene is also receiving developmental attention. A method has been contrived for determining small amounts of

sulphur in naphthalene. Studies are under way on the oxidation of ethylnaphthalene. A new procedure has been found for making vinyl-naphthalene, which has promise in plastics technology. Cyclopentadiene, one of the recently investigated coal chemicals, is now recovered by a number of coke plants for use in the production of synthetic resins. A novel approach to the separation of the constituents of anthracene cake has been the guide to a process of manufacturing a new product. Improvements have been made in the preparation of vinylcarbazole. Progress has been accomplished in the synthesis of picolines and of vinyl derivatives of pyridine and in research on the oxidation of lutidines and picolines.

Progress in Plastics Technology.—The institute's specialists in plastics have kept on increasing their investigational acquisitions. A pilot plant for making bentonite plastics is in operation as an adjunct to the laboratory work. Service tests have demonstrated the utility of new coriaceous plastics in several essential industries. Preformed plastic, developed in a 5-year joint program, is produced from a mixture of 99 per cent water and 1 per cent wood fibers and a phenolic resin, beaten together and then strained by vacuum through a screen to preform to the desired shape, as an airplane wing tip. The wet preform is next oven-dried and molded under heat and pressure. The density can be varied from that of a suberose substance to a strong material resembling hardwood. Research is continuing on organic plastics containing sulphur. Much work has to do with processing and utilizing plastics. Precision casting, molding-laminating techniques, and drying are being investigated. Fibrous reinforcing fillers for molding mixtures are receiving study. Other projects relate to new plasticizers.

New Organosilicon Products.—An offspring of inorganic and organic chemistry in combination, the research on organosilicon derivatives has covered much ground excellently in both theory and practice.

The technical glassware fellowship was founded in 1931 for the development of certain types of glass composition. Later the problem of coating glass blocks with a cement-adherent material, assigned to the fellowship, was successfully solved; the patented process is now in industrial use. The fellowship was then asked to carry on research on the synthesis of organosilicon compounds intended as impregnants for electrical glass tape. This investigation, in a new field of chemistry, brought unexpected and useful findings. A series of organosilicon oxide fluids or liquid polysiloxanes was synthesized and proved to be the basis for other diversified preparations. Resinous compounds of utility in impregnating and molding were also discovered.

Fluids are now being made that have high heat stability and low freezing points, with exceedingly small slope to the temperature-viscosity curve. Greases have been developed that retain a petrolatum-like consistency between -40° F. and 400° F.; they have found uses as lubricants or electrical sealing compounds where corrosive and high-temperature conditions prevail. Water-repellent compounds that are neutral in reaction are available for application to ceramic insulators and the like. Resins are in production that are natural complements to inorganic spacing materials and have thus given rise to a new class of electrical insulation, unique for its heat-resistance and moisture-proofness. The laminating type of resin employed in conjunction with glass cloth

affords sturdy panels that are electrically non-tracking and nonflammable. Temperature-resistant elastic types of silicones have been under development for several years and some of them are now on the market. Practically all the materials produced were originally completely allocated to war purposes and have helped in the solution of problems presented by the armed forces. This laudable co-operative program has built a completely new division of chemical products, obtainable in quantities for increasing the potentiality of many industries.

Novel Synthetic Lubricants.—Through the co-operation of the multiple fellowship on special lubricants and the Bureau of Aeronautics, Navy Department, there have been evolved new and improved instrument lubricants of real utility. Processes have been devised and demonstrated for making these novel lubricants on a manufacturing scale.

Synthetic organic chemicals appeared to be the most promising sources for new lubricants with strict properties. Accordingly, several hundred compounds were synthesized and studied extensively, and from the most promising of them 185 blends were prepared. The best compositions determined by laboratory examination were then tested under operating conditions by Naval Air Stations and instrument manufacturers. It was next decided to transfer the procedure for making one of these oils from the laboratory to a unit plant and to introduce such alterations in the processing as became necessary. From this work has come a very satisfactory method that yields a high quality product.

Industrial Hygiene Foundation in the Maintenance of Manpower.—Industrial Hygiene Foundation, a nonprofit national association of industries, which has its headquarters at Mellon Institute, has contributed to the forward health movement in technology through its numerous services and activities for the maintenance of manpower among its member companies and the industrial fields in general. Most important have been plant hygiene investigations to appraise working conditions for their possible effects upon health, and to provide preventive engineering measures to control noxious and obnoxious exposures in work places.

Numerous studies have been made of soldering operations. No significant lead hazard has been found where soldering irons are used, but in some instances torch soldering or lead baths emit dangerous quantities of fume, the latter occurring where the lead is heated excessively. In 1944-45 several chemical dermatitis problems were overcome through the co-ordination of field investigations with experimental studies by ten dermatologists. In other research airborne asbestos dust was studied.

Research chemists of member companies are urged to use every precaution while developing new compounds. If it is thought that a new material will have commercial interest, information on its physiological action is obtained. Where no data are available or if toxicity is suspected, range-finding animal experiments are conducted so as to classify the new substance. Chemical engineers then devise manufacturing processes that have safety as a prime requisite. As far as possible the only difference between the laboratory micro-pilot installation and the later full-scale plant is one of dimensions. In short, precautions are built into the production processes.

In addition to its plant hygiene surveys, the foundation, with the collaboration of the United

States Public Health Service, has carried on a program, started in 1940, to help reduce sick absences in the industries. Systematic course of action in industrial hygiene demands concrete knowledge not only of the amount of sick absenteeism, but also of when, where, and why it occurs.

Mellon Institute's Department of Research in Pure Chemistry.—The work of this department has been largely devoted to chemotherapeutic studies, with particular emphasis on the synthesis of new drugs of possible antimalarial activity.

The novel hydroxyethylating agents developed for use with apocupreine have been applied to a variety of new compounds, some of which are possibly useful as therapeutic agents. Substituted lepidylpyridinium and quinolinium bromides and lepidyl mercaptans have been tested as antimalarials. Basically substituted diphenyl ethanolamines and substituted mandelic thioamides have also been prepared as antimalarials.

Of the two synthetic antimalarials that have achieved clinical usage—namely, quinacrine and pamaquine—the latter is representative of the most active chemotherapeutic agents so far discovered for the treatment of malaria. Adoption of pamaquine to any extent in actual medical practice is, however, precluded; the United States Army has advised against its routine use because the margin of safety between therapeutic and toxic doses is too small. This experience has led to the departmental search for modified compounds which will retain high antimalarial activity but will be much less toxic to the host. The possibility of obtaining a much less toxic drug of this type is an additional attraction in that pamaquine has been found to have true prophylactic action at the toxic-dose level. A considerably less toxic analog of sufficient antimalarial activity may therefore prove to be an effectual prophylactic agent against malaria. Here, of course, is the ultimate goal of malaria chemotherapy.

This research on the detoxification of pamaquine has been patterned after the work previously done in this department in detoxifying the antipneumococcic agent "Optochin," work which resulted in the discovery of hydroxyethylapocupreine. A comprehensive plan has in fact been undertaken to synthesize and study hydroxyethyl analogs of the pamaquine series. Several compounds in this class have been made and one substance has shown considerable promise. At present several analogous drugs, which it is hoped will show a corresponding lowering of toxicity together with an enhanced antimalarial activity, are in process of synthesis and testing.

With the assistance of the new alkylating agents, the hydroxyethyl ether derivative of morphine has been prepared, and some of its pharmacological properties have been determined. Introduction of the hydroxyethyl group was again shown to cause a marked lowering of systemic toxicity. In mice, hydroxyethylmorphine was $\frac{1}{4}$ as toxic and $\frac{1}{2}$ as convulsant as morphine, $\frac{1}{11}$ as toxic and $\frac{1}{17}$ as convulsant as the methyl ether of morphine (codeine), and $\frac{1}{20}$ as toxic and $\frac{1}{22}$ as convulsant as the ethyl ether (dionine). The analgesic power of hydroxyethylmorphine in mice, subjected to a pain stimulus induced by heat, was substantially equivalent to that of codeine and dionine.

W. A. HAMOR,
Assistant Director, Mellon Institute.

MENG CHIANG. A quasi-independent state formed by the Japanese in 1939 from the Chinese provinces comprising Inner Mongolia, and maintained by them until the Japanese surrender in August–September 1945. Meng Chiang had an estimated area of about 200,000 square miles and a population (1939) of between 5,000,000 and 7,000,000 Chinese and Mongols, and in 1937 about 36,000 Japanese civilians, whose numbers are believed to have grown rapidly until the decline of the Japanese empire. Meng Chiang, signifying “lands across the Mongol border,” became strategically and politically important in the Japanese imperial scheme as a buffer state between north China and the Mongolian Republic (Outer Mongolia). See also INNER MONGOLIA; MONGOLIA; MONGOLIAN REPUBLIC.

MERCHANT MARINE, United States. See MARITIME COMMISSION, UNITED STATES.

MERCURY. Restrictions on the use of mercury were eased in September 1943 and were withdrawn in February 1944. The data for 1944, as reported by the United States Bureau of Mines, indicates a partial return to consumption for purposes formerly banned by War Production Board Order M-78, the completion of certain aspects of the war program involving mercury, and the opening up of a new phase of war demands. The approximate production of mercury in 1944 was 37,300 flasks (a flask contains 76 pounds) and the approximate consumption amounted to 42,900 flasks. During 1944 there were gains in the use of mercury for agricultural purposes (which includes the use of additional amounts for wood disinfectants and the resumption of quantities for turf fungicides); severe drops in pharmaceutical and other uses; and noteworthy gains in the use for electrical apparatus. The total production for the first six months of 1945 was 17,500 flasks, while consumption for the same period rose to 41,300 flasks. This rise in consumption was due to gains in the manufacture of red mercuric oxide for battery use.

MESOPOTAMIA. See IRAQ.

METALLURGICAL ADVANCES. The year 1945 has been one of transition from wartime to peacetime metallurgy and while a considerable amount of information has come to light concerning processes developed in wartime, the real advantages of these processes to peacetime metallurgy has not been fully determined. From the standpoint of public interest, the metallurgy of uranium has occupied the center of the stage because of its use in the manufacture of the atomic bomb. It appears that the metallic uranium, which was used as the starting point for plutonium production, was made in accordance with well known methods, the actual metal being produced by sodium reduction of the uranium halides.

Plutonium was produced from the uranium metal by bombardment with neutrons emitted by the U-235 present in the uranium and slowed down by traversing suitable thicknesses of graphite. The plutonium formed, being a separate chemical element and not an isotope, was separated from the residual uranium by chemical methods, the exact nature of which has not been made public.

In addition to the basic metallurgy of the process for producing plutonium, the metallurgist was called upon for a great variety of engineering materials, among the most interesting of which were the diffusing barriers for separating the U-235 isotope of uranium from the heavier

isotopes. We lack information as to the exact nature of the finally selected barriers of atomic screens, but it appears that a number of alloys such as copper-manganese and nickel-manganese, where one of the constituents is much more readily attacked than the other, can be rolled to thin sheets and screens of atomic dimensions made by suitable chemical treatment.

Finally one of the most interesting features of the whole process for producing the unstable elements which liberate atomic energy is that almost all of the uranium which goes into the process is obtained as a by-product of the process in the form of U-238, which has been substantially freed from both U-235 and plutonium. This provides a real problem for the metallurgist, to find a use for such unexpected quantities of by-product, uranium.

In spite of all of the fanfare about elements Numbers 92, 93 and 94, element Number 26 still remains the backbone of the metallurgical industry. Element 26, of course, is iron.

Iron and Steel in 1945.—Steel making capacity on Jan. 1, 1945 was rated at 95,500,000 tons, an increase of 13,750,000 since 1940. Examination of these figures shows that a greater amount of new iron is being used to produce each ton of steel, than was the case before the war. There has been a substantial increase in the amount of alloy steel made in the open hearth. This has been due, in considerable measure, to increased use of multiple alloy steels such as the national emergency steels adopted during the war. This tendency to use the combined effects of a number of alloys to bring about the desired properties has resulted in the suggestion, which has received some acceptance, of purchasing alloy steels on hardenability specifications. In this procedure the chemical specification covers only the type of alloy steel. The amounts of the several alloying elements, which may be used, is left optional with the steel maker so long as the finished steel meets a definite specification for hardenability. The American Iron and Steel Institute has made up a list of type specifications of these so-called H steels and the hardenability ranges, which can be obtained within the type specifications. In the field of tool steels, it appears that the molybdenum tungsten high speed steel, developed because of the shortage of tungsten, will continue to be used on account of its merits. The addition of cobalt to tungsten high speed steels has increased and enables tools made from these steels to cut material of 300 to 400 Brinell.

There has been an increase in the use of cemented carbides and particularly a recognition of the necessity of heavy supports for carbide tips, which is essential to make use of the high modulus of cemented carbides which may be 80,000,000 compared with 30,000,000 for steel.

Not much that has been developed during the war in the way of changed iron and steel-making practice will be carried over to peacetime. It was found that the aluminum necessary for deoxidizing steel may be reduced by using a borax slag, which dissolves out some of the oxides that would otherwise have to be reduced by aluminum. Aluminum dross has been used as a substitute for fluorspar. The Bureau of Mines has developed a process for agglomerating fine fluorspar to make it acceptable for open hearth use, which should go a long way in solving the fluorspar problem.

There has been continued interest in iron ore preparation, as everyone recognizes that the industry must use an increased amount of bene-

ficiated ore. All beneficiated ore is necessarily too fine for blast furnace use and some form of agglomeration it must be resorted to. The classical methods of nodulizing and sintering are the only ones so far tried on a large scale. Rolling up the slightly wet ore into glomerules and heating to form strong, very porous balls, a process which was developed in the Bureau of Mines' laboratories in 1933, has received increased attention.

Light Metals.—New aluminum alloys of greater hardening range have been announced by both Alcoa and Reynolds. The future of the government-owned aluminum production plants built during the war was still in doubt on November 1. It is improbable that the rate of aluminum production, which was achieved in wartime, will again be required for several years. In the case of magnesium, ingot capacity was expanded 100 fold during the war. Before the war the use of magnesium was largely restricted to castings. While this is still the largest field for magnesium, greatly increased consumption, if it is found, must be found in the wrought alloys which have been used for furniture, truck bodies and almost all of the uses to which aluminum has been put. New alloys such as those with 5 per cent aluminum, 1 per cent zinc and .3 per cent calcium have simplified the production of sheets. An alloy with 8½ per cent aluminum and .5 per cent zinc, provides the highest strength of the wrought alloys in commercial use. When extruded and hardened, it has a strength around 50,000 pounds per square inch. An alloy of magnesium with 4 per cent of manganese and 4 per cent of nickel has been found to have a slightly higher tensile strength and to retain this tensile strength to a remarkable degree at high temperatures. It presents difficulties from corrosion which have not yet been overcome.

Titanium.—Titanium has been receiving increased attention as an addition to steel for neutralizing carbon, as a constituent of high temperature alloys for gas turbines, as a constituent of rolled zinc alloys and alloys to make glass to metal seals and finally as a ductile light metal with unusual physical properties. The Foote Mineral Company has produced titanium by the De Boer process of decomposing titanium iodide on fine incandescent wires. The Bureau of Mines has used the Kroll process of reducing titanium tetrachloride with magnesium and sintering the product so obtained in vacuum. The product of both of these methods is highly ductile, corrosion resistant and suitable for any type of fabrication. See also CHEMISTRY; MINES, UNITED STATES BUREAU OF.

R. S. DEAN,
Assistant Director, Bureau of Mines, U. S. Department of the Interior.

METEOROLOGICAL SOCIETY, American. Founded in 1919 through the initiative of Dr. Charles F. Brooks, then of the United States Weather Bureau, the society, starting with less than 600 members and a budget of less than \$2,000, in 1945 had a membership of more than 2,700 and an annual budget of around \$35,000. The members meet in regional and national gatherings in different cities at various times of the year. There are some 20 or 30 local branches which meet at regular intervals. While anyone interested in meteorology may become a member of the society, in 1944 there was established a separate class of professional members. The society is active not only in promoting developments of meteorological theory, but also in the practical and personal affairs of the profession, as, for in-

stance, in the placement of returning veterans, who have had meteorological experience. Since 1920 the society has published 10 times a year its *Bulletin*, which brings to its members news of the latest developments in weather science and organization. In 1944 it began publication of a quarterly *Journal of Meteorology*, devoted to the presentation of important research. The society maintains a book service, and publishes a classified list of publications, with summaries. President, Prof. C. G. Rossby, University of Chicago; secretary, Prof. Charles F. Brooks, Harvard University.

METEOROLOGY. The cessation of hostilities has led to the release to the public of considerable information on wartime developments in weather service and in instrumental aids for navigation in bad weather. Some of this publicity gives the impression that great advances in forecasting have been made and that new navigation aids will render weather forecasts less necessary.

However, the results of war research and experience are really most striking for the wholesale application of certain techniques known or suggested, but little used before the war. During the war, areas of the world and expenditures of men and equipment were involved to an extent meteorologists used to hope for and dream about, but never believed possible in this generation. In this way we have learned a lot about the value in other parts of the world of ideas, instruments, and techniques which previously had been tried, if at all, only on a limited scale and in restricted regions. Also, we have found out some of the peculiar problems that must yet be solved in order to provide adequate weather service in remote regions, where civilian aviation may wish to go in peacetime, or the military in a future war. The immediate importance of such intelligence should not be underestimated, nor eclipsed by the glowing promises for the future of certain new developments that just began during the war. The scope of wartime meteorological experience could not be fairly indicated in anything less than a book, but it will suffice to mention several items:

(1) Millions of daily surface and upper-air weather observations were taken by the Allied armies and navies at hundreds of stations scattered over more than half the globe, in regions where such observations were very scanty, inaccurate, incomplete or nonexistent heretofore. These data are being preserved in convenient form for meteorologists to analyze. The civilian weather services will take over as many of the military weather stations as they can in order to continue the worldwide network necessary for international civil aviation.

(2) Much of the vast amount of meteorological equipment of the army becomes excess and is being turned over to civilian services and other governments to use for the benefit of all weather services.

(3) Most of the large number of men trained in meteorology for and by the army and navy will return to civil life and their experience will thus become available to the airlines, Weather Bureau, universities and industry. The American Meteorological Society is actively endeavoring to obtain or create opportunities for these men where their weather experience in the war can be applied to good advantage.

(4) The preparation of background materials for use of forecasters was carried out on a much more extensive scale by the military services than ever done before. In particular, sets of historical

(past) daily and average weather maps (both sea level and upper air) were compiled and published. One of these sets is said to have repaid its great cost many times over by the aid it gave in making the forecast for D-day in Europe. These maps and other voluminous tabulations made for military planning will become available to the public and may be of as great value in peace as in war. The need for such materials has long been recognized and only prohibitive cost prevented their earlier preparation.

Probably not all the new developments from the war years have been made fully public as yet. Already the imagination of the public is fired particularly by the uses of radar, among which the application to storm detection is prominent. Undoubtedly, from the professional point of view too, this is the single most promising recent meteorological development. The Civil Aeronautics Administration (CAA), airlines, and Weather Bureau are now taking a hand in this work and much will be heard about it in the next few years. Radar installations in planes and on the ground will detect fog, clouds and rain, for miles around, indicate their thickness and intensity, etc., permit airplanes to steer a safe path through them to destinations or landings, and to avoid hitting other planes and mountains. But it does not necessarily follow that, as a result of radar, weather reports and forecasts may no longer be much needed for aviation, for many aviators will not plan to fly if dangerous weather is accurately forecast. Moreover, the radar weather reports will amplify the detail in weather observations to an extent that better forecasts will be possible. Another valuable use of radar is in providing wind observations from planes flying over the sea. The radar gives the absolute height of the plane. By comparing at two successive times this measure with the indicated altimeter height, the navigator can compute the true wind direction and speed even when the sea or sky is invisible. This information can be radioed back to help the weather forecasters and also used by the navigator to revise his flight plan. The tracking of balloons for upper-wind measurements is now often accomplished by radar, permitting observations to great heights regardless of weather (clouds).

The army and navy have pioneered and developed the use of "weather reconnaissance" by aircraft to obtain current weather data from remote areas, especially the oceans, needed for forecasting for critical regions. Radar methods described above have been a basic adjunct in weather reconnaissance. We may expect the civil weather services to adopt such aircraft reconnaissance, especially of hurricanes.

Finally, we may mention the recently increasing use of punched-card machine methods for tabulating weather reports for climatological and weather research studies. The army now has millions of cards punched with weather data, and the Weather Bureau as well as foreign weather services are also taking up this powerful and efficient method on a large scale.

The letdown of wartime restrictions did not come in time to be greatly reflected in the meteorological publications during 1945. However, a few noteworthy textbooks and papers appeared: *General Meteorology*, by H. R. Byers; *Dynamic Meteorology*, by Holmboe, Forsythe and Gustin; *Use of Pressure Altitude and Altimeter Corrections in Meteorology*, by J. C. Bellamy; and *Handbook of Meteorology*, edited by Berry, Bollay and Beers.

ROBERT G. STONE,
American Meteorological Society.

METHODIST CHURCH. The Crusade for Christ, which was planned by the General Conference of 1944, has been pressed vigorously. The first objective, an emergency fund for relief and restoration, has been achieved by subscriptions of \$27,577,815 of which \$21,380,194 had been paid before Nov. 23, 1945. Some progress has been made toward the increase of Sunday school attendance, which has suffered heavy declines in recent years. Evangelism is now being pressed, both in reviving the interest of the million members classed as "inactive", and through a New Life Movement, headed by Rev. Albert E. Day of California, which will arrange for evangelistic campaigns throughout the country. The upturn in prosperity, due largely to the war, is reflected in reports of all the administrative bodies. The Board of Publication had record sales of \$8,315,232. From the net produce, \$400,000 was appropriated for distribution among the retired ministers. The total number of Sunday school helps and story papers rose to 89,000,000 copies. A new headquarters building will be erected in Nashville, Tenn., a new building bought in Kansas City, and \$500,000 will be spent on presses and other equipment. It is planned to offer scholarships in schools of journalism for young people who wish to prepare themselves for work in the Publishing House.

Bishop Badley of India, Bishop Gattinoni of South America, and Bishop Springer of Africa, have retired. The Rev. Arthur F. Wesley was elected for South America, and the Rev. John A. Subhan for India. The latter is the first Mohammedan convert to be elected a Methodist bishop. War conditions prevented the Central Conferences in Germany and China from meeting. Bishop Ralph Ward of China has been liberated after internment by the Japanese. Bishop Edwin F. Lee, of Southwestern Asia, who escaped from Singapore, has revisited his field. Bishop Melle of Germany survived the Battle of Berlin, and has resumed his activities. He reports havoc among the Methodist church properties in the Reich.

The Methodist Committee on Overseas Relief reports receipts for the fiscal year ended May 31, 1945 of \$673,296. For China Relief this body has disbursed \$216,619, and through other agencies, Methodist and interdenominational, about \$460,000. The Crusade for Christ presented \$25,000 for child relief in Greece through Archbishop Damaskinos, regent of the kingdom. Methodist offerings for World Service (benevolences) totaled \$5,803,049, not including special gifts of \$678,336, and over \$4,000,000 raised by the Women's Society of Christian Service.

The statistics of membership, etc., show full membership 8,046,129, of whom 1,318,258 are classed as "inactive." The enrolment in the 20,826 church Sunday schools was 4,898,096. The number of preaching places was 41,067; value of churches and parsonages \$602,398,329, on which the indebtedness was \$25,587,960. Debts had been reduced by \$12,197,000 in the year. Local church expenditures amounted to \$87,173,254. There were 18,269 effective ministers, and 5,385 on the retired list. Supply pastors, mostly local preachers, numbered 3,759. There were 21,104 pastoral charges, and 41,067 preaching places. The Woman's Society of Christian Service (a union of the former missionary societies, Home and Foreign) has 30,283 local units and 1,161,389 members. JAMES R. JOY, *Librarian and Historian, Methodist Historical Society, New York, N.Y.*

METROPOLITAN MUSEUM OF ART, The. Plans for large-scale additions and alterations to the museum's building, located in New York City, were announced at the annual meeting in January, 1945. The proposed changes will cost several million dollars and will make possible a more attractive and legible arrangement of the museum's vast collections, besides providing special space for The Whitney Museum of American Art and for a new auditorium, better library stack arrangement and other improvements.

Under the new scheme the museum will be divided into five museums to function under one roof: the Museum of Ancient Art, devoted to the civilizations of the Mediterranean basin, Egypt, the Near East, Greece and Rome; the Museum of Oriental Art, covering the civilizations of Islam and the Far East; the Picture Gallery, which will in turn be connected with the departments of the graphic arts and the print room; the Museum of Decorative Arts, which will cover the systematic evolution of art in Europe from Roman times to the present day, displaying arms and armor, textiles, costumes, glass, ceramics, etc.; a museum to cover the entire development of American art from Colonial times to the present day, to include The Whitney Museum of American Art and the American Wing.

At the annual meeting it was also announced that attendance during 1944 had broken all records and reached over 1,680,000. It continued to increase during 1945.

The museum continued to work out its plan to rearrange collections, to give them attractive settings and make them more easily understandable to the public, as far as possible, in the present building. The first major step in this direction was the reinstallation of paintings on their return from safekeeping in 1944, and the second was the opening of nine rearranged galleries of Greek art in the spring of 1945. These will become a part of the permanent Museum of Ancient Art which will occupy two floors of the south wing and will show in logical sequence the arts of Greece and Italy from the Neolithic period, about 4000 B.C., to the breakup of the Roman Empire in the 4th century A.D. The new installation of Greek art met with critical acclaim.

The more important special exhibitions of 1945 included "William Sidney Mount and His Circle," in which the beginnings of American genre painting were shown; "Costumes from the Forbidden City," a dramatic exhibition of about 200 richly embroidered robes, brilliant in color, set theatrically against backgrounds suggested by the actual Forbidden City of Peking; "American Fashions and Fabrics," in which dresses made of fabrics designed from objects in the museum's collections were shown in a series of fashion promenades and in an exhibition; "Prints and Drawings by Goya"; "The War Against Japan," an exhibition of over 100 paintings and drawings by official artists of the Army, Navy, and Marine Corps, and by *Life* correspondents, sponsored by the Treasury Department.

"The Living Past of China," a special exhibition of museum material designed to go on tour through the city's high schools, was one of many activities in which the museum co-operated with schools of the city. The Junior Museum also geared itself to fit in with specific studies of the grade and junior high schools and put on an exhibition on "Paul Revere," which was attended by about a thousand school children a week during the school year. Classes were also taken by guides to whatever part of the museum ap-

plied to their studies, and this was a constant activity. A full schedule of lectures and gallery tours on special exhibitions and on the permanent collections was maintained.

For the second year, the museum's Holiday Shop was opened during the Christmas season and sold vast quantities of Christmas cards taken from paintings and other objects in the collections, special publications, reproductions, casts and other gifts. Museum publications of the year include *The Ch'ing Ming Shang Ho Spring Festival on the River*, a portfolio of 10 details in color from a Chinese scroll painting of the Ming dynasty; *About the Round Table*, by Margaret R. Scherer; *The Great King . . . , King of Assyria*, with photographs by Charles Sheeler, an introductory essay, *The Assyrian Phenomenon*, by Susanna Hare, and *The Palace and Reliefs of Ashurnasirpal II*, by Edith Porada; *Painting in Flanders*, by Roberta M. Fansler and Margaret R. Scherer; *Scenes from the Life of Jesus*, with Quotations from the Bible, arranged by A. T. Gardner (December 1944); *The Slain Soldiers of Neb-Hepet-Re Mentu Hotpe*, a publication of the museum's Egyptian Expedition, by Herbert E. Winlock. The museum also published a large number of inexpensive guides and picture books based on the collections.

An important acquisition of December 1944, is a set of ten Gobelins, tapestries representing months of the year (French, 1732-1737), the gift of John D. Rockefeller, Jr. Acquisitions of 1945 include an enormous ornamental vase of malachite mounted in gilt-bronze (by Thomire of Paris, 1819), purchased from Mrs. Cornelius Vanderbilt and long in the hall of the Vanderbilt house at 640 Fifth Avenue; a painted terracotta portrait bust, probably representing Sir Henry Guildford, by an Italian sculptor working in England in the first quarter of the 16th century; painted boiserie of the boudoir of the Hotel de Crillon in Paris, in the Louis XVI style, probably executed between 1776 and 1782; a collection of more than 160 examples of various types of English pottery of the 17th and 18th centuries, a gift of Mrs. Russell S. Carter; a Flemish tapestry (School of Arras, about 1420) representing the Annunciation, previously in the collection of Mrs. Harold I. Pratt; a marble relief of a youth and horse, Greek, 4th to 3rd century B.C., approximately half life size; a red-figured Athenian amphora showing Perseus and Medusa, about 450-440 B.C.; a black-figured Athenian hydria showing Achilles and Troilus, about 600-550 B.C.; a silver cauldle cup made by William Cross, Boston, Mass., late 17th century; a mantle clock made by Aaron Willard, Jr., Boston, Mass., c. 1800, bequest of Herbert Lee Pratt; a chest of drawers, pine with painted decoration, probably Connecticut, c. 1700, the gift of Mrs. J. Insley Blair; a Pennsylvania German walnut and leather settee, c. 1700, gift in memory of Mrs. J. Amory Haskell; a curly maple daybed, New England Queen Anne style, c. 1740, gift of Mr. and Mrs. Paul Moore; sideboard and tambour-front cases for silver, American, probably made in Baltimore, 1795-1800; *The Muse*, a painting of his daughter by Samuel F. B. Morse, the bequest of Herbert Lee Pratt; a group of contemporary American paintings; the Robert Hamilton Rucker collection of Japanese sword furniture, comprising 125 pieces of the finest workmanship by the first fifteen masters of the main Goto family, 16th to 19th centuries.

CHARLOTTE HUGHES,
Department of Public Relations, The Metropolitan Museum of Art.

MEXICO. A federal republic bounded by the United States on the north, on the west by the Pacific Ocean, on the south by the Pacific, Guatemala, and British Honduras, and on the east by the Gulf of Mexico. The area is 758,258 square miles. The central body of Mexican territory is a vast tableland from 5,000 to 8,000 feet high, ringed by mountain chains which in general parallel the Pacific and Gulf coasts. Many volcanoes are found in central Mexico, most spectacular of which is the new volcano Parícutin which began eruption in February 1943. The Yucatán peninsula, curving northeastward toward Cuba, is a flat, low-lying region. Mexican climate is principally subtropical, except where tempered by altitude. The 1940 census showed a population of 19,653,552; a 1943 estimate was 21,153,321. The capital and largest city is Mexico City (pop. 1,749,916); other important cities are Guadalajara (229,235), Monterrey (186,092), Puebla (138,491), Mérida (98,852), León (86,089), Aguascalientes (82,234), Tampico (81,334), San Luis Potosí (78,042), Torreón (76,613), Veracruz (71,720), and Chihuahua (57,476). Mestizos (mixed bloods) constitute more than half of the total population, Indians 29 per cent, and whites 17 per cent. Immigration at all times has been relatively light; the total foreign population was estimated in 1938 at 500,000; Spaniards constitute the largest group of foreigners. Mexico was conquered by Cortés in 1521 and fabulous sums of gold and silver won for Spain. The ready wealth made Mexico (as the viceroyalty of New Spain), along with Peru, one of the most important parts of the Spanish colonial empire. Independence was finally won from Spain in 1821. The present constitution was promulgated Feb. 5, 1917; it has subsequently been amended frequently. Mexico is divided into 28 states, a federal district, and three territories. The states elect their own governors and legislatures but, to a much greater extent than is true in the United States, are under the political domination of the national government. The president is elected by direct popular vote for a six-year term and is ineligible for reelection. The bicameral congress includes a Senate and a Chamber of Deputies. The former consists of 58 members, two from each state and the federal district; the Chamber of Deputies is chosen on a population basis and now includes 147 members. A permanent committee of 14 senators and 15 deputies represents the congress in the intervals between sessions. The judiciary is headed by a Supreme Court of Justice. The Cabinet contains 11 ministers, headed by a minister of government. The dominant party is the PRM (Partido de la Revolución Mexicana), nomination by which for the presidency is tantamount to election. The president in 1945 is Manuel Ávila Camacho, who assumed office Dec. 1, 1940. Presidential and congressional elections are scheduled for July 7, 1946.

Religion and Education.—Roman Catholicism is the dominant faith, although state and church are entirely separate and have had a long record of recurrent antagonism. The constitution of 1917, as had the preceding constitution of 1857, severely restricted the position of the Catholic Church. Since the election of President Lázaro Cárdenas in 1934 relations between state and church have been more amicable, with further improvement under Ávila. Regulation of the number of priests is a matter for state action. It was alleged in 1945 that certain Catholic circles were reviving anti-Protestant agitation. Arch-

bishop Luis Martínez on May 16 ordered Catholic clergy to abstain from political activity.

Primary education is compulsory and primary and intermediate education free. Literacy was officially estimated to have increased from 41 per cent in 1930 to 48 per cent in 1945. Education statistics show 23,191 primary schools with 2,037,870 pupils, 388 intermediate schools with 64,758 pupils, and 13 universities, most important of which is the National University of Mexico with approximately 10,000 enrolled. A new teacher training institute, authorized by law Dec. 26, 1944, opened March 19, 1945, for the primary purpose of training rural teachers. The most spectacular and significant educational development continued to be the national literacy campaign authorized by law August 21, 1944; three stages were provided: organization, August 1944, through February 1945; teaching, March 1945 through February 1946; and review and appraisal, March-April 1946. The government late in 1944 launched a joint federal-state-private school-construction program.

Communications.—Railway mileage is 12,741, of which the principal lines are the National Railways of Mexico and the Southern Pacific of Mexico. The railways have suffered greatly during the war from lack of equipment and repairs, though Mexico has begun manufacturing some of its own rolling stock. The government announced that 46,433,000 pesos (peso = 20 cents) were spent on repairs and maintenance of national railways in 1944. Highway mileage is 43,711 but less than one-fourth of that is classified as all-weather. The Pan American Highway is being extended toward the Guatemalan border; 109 miles south of Mexico City have now been paved. Airlines now operate a total of 37,593 miles of routes. Nationalization of transportation facilities continued in 1945. Early in the year, the government was negotiating for the purchase of British-owned railways and on January 23, Pan American Airways disposed of its majority control of the Compañía Mexicana de Aviación, as required by Mexican law. A strike by CMA pilots tied up all domestic-run lines for eight days beginning March 5. Mexican and Canadian private interests were negotiating early in 1945 for a new shipping line linking the two countries' Atlantic ports. Vehicle registrations in 1943 included 113,427 automobiles, 11,145 busses, and 53,461 trucks. There are approximately 175,000 telephones with 40,380 miles of line, 43,000 miles of telegraph lines, 750,000 radio receiving sets and 216 broadcasting stations, and 3,682 post offices.

Production.—Mexico is primarily an agricultural country, though only a small fraction of land classified as "agricultural" is actually so used. During the Cárdenas administration much impetus was given the program of land distribution in the form of *ejidos* (communally owned plots) but that program has declined under Ávila Camacho. The latest economic census showed more than 4,000,000 people engaged in agriculture with total annual production valued at about \$175,000,000 and with approximately 17,000,000 acres under cultivation; probably an equal acreage could be brought into cultivation if irrigation facilities existed. Corn is the principal crop and the staple food, though production does not ordinarily satisfy domestic needs. Beans are second in importance as a crop and an article of diet. Other crops raised, chiefly for domestic consumption, are wheat, rice, chickpeas, sugar, coffee, fruits, and vegetables. Crops exported in significant amounts include bananas, henequén, coffee,

and winter vegetables. Stock raising is important in many sections and there are about 165,000,000 acres of grazing land. Mexico has about 12,000,000 cattle and 5,000,000 hogs. The 1944 corn crop was estimated at 2,440,483 metric tons as against 1,775,200 tons in 1943 and 2,356,236 tons in 1942. Estimated wheat production for 1943-44 was 396,000 metric tons, a decline of 33,000 tons from the previous year. Wheat consumption in 1944 was estimated at 700,000 to 750,000 tons, the balance over production being imported mostly from the United States. The 1944 cotton crop was estimated at 504,280 bales (about 187,962 bales coming from the Laguna region in north central Mexico); plantings for the 1945 crop were somewhat reduced, especially as the stored surpluses, almost equalling one year's crop, were causing grave concern. Production of winter vegetables was slightly less in 1944 than in 1943. Chickpea production in 1944 was about 74,000 tons. Production of refined sugar in 1943-44 was 390,000 metric tons but consumption was 445,000 tons and was expected to increase in 1945. Henequén production in 1944 was 199,456 tons and that of sesame seed 55,000 tons; shelled peanut production in 1944 was about 57,000 tons. The 1944 rice crop was estimated at 4,600,000 to 5,400,000 bushels as against 5,682,000 in 1943; a government decree Nov. 22, 1944, put production of rice for 1944-45 under strict government control. Crop estimates for 1945 were generally lacking, although the sugar crop was estimated at 409,000 short tons. The livestock industry had a generally poor year in 1944; the fishing industry expanded, however. Mexico's chief forest products are chicle, vegetable waxes, and woods. Lumbering operations were down in 1944 due to lack of logging equipment, but mahogany production totalled about 25,000,000 board feet. Production of metals and minerals was about 20 per cent less in 1944 than in 1943, due largely to tapered United States demands. Crude petroleum production in 1944 was 36,120,000 barrels, a considerable decline from previous years. Petroleum reserves were officially estimated Jan. 1, 1945, to be 800,000,000 barrels, though private estimates put the amount at 660,000,000 barrels. Iron production in 1944 was 186,960,771 kilograms as against 137,936,273 kilos in 1943. The United States by the beginning of 1945 had stopped its purchases of celestite, mercury, and tungsten. Government stimulation of both agriculture and mining continued in 1944 and early 1945. Students entering the national college of agriculture are now required to pledge three years of professional service after graduation. The government early in 1945 began opening machinery centers. It also announced that in the first three years of the Ávila administration 928 presidential proclamations had granted 2,800,000 acres to 17,304 *campesinos* (peasant farmers). The government early in 1945 began encouraging greater national use of native minerals such as iron, lead, zinc, copper, antimony, mercury, silver, and coal; Mexico normally produces about two-fifths of the world's silver. Mexico's industrial production is limited but growing. The latest industrial census showed 12,624 industrial establishments employing 332,323 workers; production value was \$802,839,189. Chief items are textiles, iron and steel products, shoes, cement, soap, flour, beer, paper, furniture, and petroleum products. The cotton textile industry was estimated in August 1945, to have 200 mills with P150,000,000 capital, 55,000 workers, 550,000 spinning needles, and 32,000 looms; 1944 production was valued at P480,000,-

000. A new refinery near Mexico City, with a daily capacity of 50,000 barrels, was scheduled for completion by the end of 1945. Beer production in the first 10 months of 1944 was 266,740,382 liters as against 259,256,484 liters in all of 1943.

Finances and Economic Conditions.—Originally announced budget figures for 1945 were P1,006,000,000 but President Ávila Camacho stated in January that extra-budgetary expenditures would total P260,000,000; they were to be financed by three government loans at 6 per cent; no government loans were contracted in 1944. The federal district (including Mexico City) announced a 1945 budget of P130,000,000, the largest in its history. The original budget for 1944 totalled P1,101,815,699.34 but this was later increased to P1,571,925,491.80. Income for 1944 was P1,285,123,839; both that and expenditures constituted a record. The largest sources of revenues were, in order, income taxes, industrial taxes, export taxes, import duties. Amendments to the income-tax law providing for pay-as-you-go collections gave the government additional revenues which were used for public works. Chief items of 1945 budgetary expenditures were agriculture, P174,000,000; education, P171,000,000; national defense, P170,000,000; public works P160,000,000; debt service, P82,600,000. Note circulation Jan. 1, 1945, was P1,358,338,491 as against P1,170,846,000 one year earlier. Deposits and sight obligations of the Bank of Mexico Jan. 1, 1945, were P1,058,056,376 as against P732,300,000 one year earlier. Metallic coins in circulation Jan. 1, 1945, totalled P528,243,076.96 as against P446,804,110.75 one year earlier. The wholesale price index for the federal district Jan. 1, 1945, was 237.9 as against 100 in 1929. There was little attempt at official rationing in 1944 and inflation continued to be serious. The government early in 1945 centralized all gold imports and exports in the Bank of Mexico. A serious economic weakness in 1944 was the general failure of the fuel supply. The government in June 1945, announced a 10-point program to promote tourism, stating that 205,000 tourists in 1944 had spent P270,000,000. Long-range industrial requirements were estimated in 1945 at \$383,000,000.

Foreign Trade.—Imports for 1944 were P1,348,635,000 and exports P1,047,846,000; the import balance was the second such recent instance, and was due to heavy food purchases and the slackening of wartime exports. The United States supplied 85 per cent of Mexico's imports, and took a like percentage of her exports.

Principal Events.—Soviet Ambassador Constantine Oumansky and eight others were killed January 25 in a plane crash on leaving Mexico City for San José, Costa Rica; later investigations failed to prove charges of sabotage. The joint Mexican-United States Commission for Economic Development was dissolved by Presidents Roosevelt and Ávila Camacho January 29 after having essentially completed its program. Hearings in the U. S. Senate in February on the water treaty with Mexico reflected vigorous organized opposition from California but the treaty was approved on April 18 by a vote of 76-10; Mexico later ratified the treaty by a large vote. A train collision February 1 at Cazadero, north of Mexico City killed 193 persons. Communications Minister Maximino Ávila Camacho, brother of the president, died February 17. The Inter-American Conference on Problems of War and Peace met at Mexico City from February 21 to March 8 and adopted important political and economic measures. An Ex-

peditionary Air Force of 298 men joined U.S. forces at Manila on May 1. A comprehensive law regulating the practice of professions took effect May 28. Minister of Government Miguel Alemán resigned June 5 to become a presidential candidate for the 1946 elections; it appeared likely that he would get the nomination of the PRM in December. Foreign Minister Ezequiel Padilla resigned July 11 but did not announce himself as a presidential candidate until September 3; though formerly democratic and pro-United States, he was rumored to have the political support of the ultra-conservative *Acción Nacional* and the highly controversial *Sinarquistas*. Padilla was succeeded as Foreign Minister on September 2 by Francisco Castillo Nájera, ambassador to the United States, who in turn was succeeded by Antonio Espinosa de los Monteros, Mexican financier and economist. President Avila Camacho announced on July 2 that some 550 army generals would be retired but would retain rank and pay; 84 generals would be left in active service. The government on August 30 recognized the Spanish government-in-exile established at Mexico City.

California, Los Angeles.

MEXICO CITY CONFERENCE. See INTER-AMERICAN AFFAIRS; PAN AMERICAN AFFAIRS; WORLD POLITICS.

MICA. Production and consumption of all kinds of mica except sheet and punch increased in 1944, according to the United States Bureau of Mines. The output of sheet and punch mica in the United States in 1944 was 1,523,313 pounds valued at \$3,262,711 compared with 3,448,199 pounds valued at \$3,228,742 in 1943. Punch mica supplied 55 per cent of the 1944 total or 835,402 pounds valued at \$147,635 compared with 2,691,083 pounds valued at \$473,955 in 1943, or 78 per cent of domestic production in that year. The use of substitute or alternate materials such as ceramics, glass, silicone resin and rubber, Lectorfilm, and paper, as well as the increased cost of mica, have contributed to the decreasing demand for sheet and punch mica.

MICHIGAN. East North Central state, United States; admitted to the Union Jan. 26, 1837. Population (1940): rural, 1,801,239; urban, 3,454,867; total, 5,256,106. Land area, 57,022, divided into 83 counties. Chief cities, with 1940 populations: Detroit, 1,623,452; Grand Rapids, 164,292; Flint, 151,543; Saginaw, 82,794; Lansing, the capital, 78,753; Pontiac, 66,626; Dearborn, 63,584.

Chief State Officers, 1945.—Governor, Harry F. Kelly; lieutenant governor, Vernon J. Brown; secretary of state, Herman H. Dignan; treasurer, D. Hale Brake; auditor general, John Morrison; attorney general, John R. Dethmers.

Judiciary.—Chief justice of the Michigan Supreme Court, Raymond W. Starr; associate justices, Howard Wiest, Henry M. Butzel, George E. Bushnell, Edward M. Sharpe, Emerson R. Boyles, Neil E. Reid, Walter H. North.

Legislature.—The state legislature (Senate, 32 members; House of Representatives, 100) convenes biennially in odd years on the first Wednesday in January.

Education.—Public elementary schools (1943-44)¹, 5,037; teachers, 19,285; pupils, 582,534.

¹ Latest school year reported.

Public junior and senior high schools (1943-44), 680; teachers, 12,670; students, 343,824; average yearly salary of elementary, junior, and senior high school teachers, \$1,992. Education in Michigan is compulsory for all children between the ages of 6 and 16, inclusive. Total state appropriation for education (1943-44), \$61,-056,196.

Finances.—Following is a statement of finances for the fiscal year 1944-45, supplied by the state treasurer's office:

Balance in treasury, beginning of fiscal year 1944-45	\$ 75,593,475.33
Receipts, 1944-45	513,156,849.73
Total	\$588,750,325.06
Disbursements, 1944-45	505,885,779.37
Balance, beginning of fiscal year 1945-46	\$ 82,864,545.69

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following tables:

CROP (and unit of production)	PRODUCTION		
	Average 1934-43	Final 1944	Preliminary 1945
Corn (1,000 bu.)	53,378	57,760	66,785
Oats (1,000 bu.)	43,223	44,100	65,072
Buckwheat (1,000 bu.)	386	512	416
Wheat (1,000 bu.)	16,320	23,022	26,196
Barley (1,000 bu.)	5,172	3,900	4,320
Rye (1,000 bu.)	1,405	949	930
Sugar beets (1,000 short tons)	857	519	680
Hay:			
Alfalfa (1,000 tons)	1,831	1,637	1,680
Clover and timothy (1,000 tons)	1,359	1,550	1,644
Tame (1,000 tons)	3,424	3,376	3,541
Soybeans for beans (1,000 bu.)	837	1,595	1,815
Beans, dry edible (1,000 bags)	4,509	4,158	3,989
Potatoes (1,000 bu.)	23,669	18,360	19,550
Cherries (tons)	35,810	54,600	9,300
Apples (1,000 bu.)	7,681	7,625	1,500
Peaches (1,000 bu.)	2,305	3,600	3,848
Pears (1,000 bu.)	1,114	1,193	125
Grapes (tons)	41,600	34,000	11,400

MIDDLE CONGO or MOYEN CONGO. See FRENCH EQUATORIAL AFRICA.

MIDWAY ISLANDS. An island group in the Pacific Ocean, some 1,300 miles north by west of Honolulu, or, roughly midway between North America and Asia. The group consists of a low coral atoll, 18 miles in circumference, enclosing two small islands (Sand Island and Eastern Island), and has a total land area of 28 square miles. The islands were unofficially claimed for the United States in 1859, and officially in 1867. Since 1903 they have been under the United States Navy Department. The surface of the islands, which rise only a few feet above sea level, is characterized mainly by sand dunes, coarse grass, and bushes. Congressional appropriations in 1939 and 1941 provided for the development of the islands as an air and submarine base. Although repeatedly attacked by Japanese sea and air forces a few hours after the raid on Pearl Harbor, Dec. 7, 1941, the Midway Islands remained in American hands and continued to be used throughout the Pacific war as a base for attacks on the Japanese.

MILITARY AVIATION. See AERONAUTICS.

MILITARY GOVERNMENT. See under WAR POLICY OF THE UNITED STATES.

MILK. Production of milk on the farms of the United States in 1944 was estimated by the Department of Agriculture at 118,952,000,000 pounds as compared with the average production

in 1934-43 of 108,213,000,000 pounds. Final figures for 1945 were not available in December, but the monthly production figures up to and including September showed increases for every month except February over the 1944 production, and increases for every month over the average production.

MINERAL EXPLORATION. See MINES, U.S. BUREAU OF.

MINERAL WOOL. According to the United States Bureau of Mines, a total of 38 companies operating 51 plants in 19 states turned out 568,296 short tons of mineral wool products valued at \$54,482,796 in 1944, as compared with 551,524 tons valued at \$43,670,710 in 1943. During 1944 there was a marked advance in industrial insulation, resulting from the larger requirements of the armed services for mineral wool insulation products on ships, aircraft, tanks, and other military equipment, as well as the realization by industry that complete insulation is necessary to maintain maximum efficiency and production during the war period.

MINERALOGY. Quartz Oscillator-Plates.—V-J Day brought the quartz radio crystal industry to an abrupt end. This little known industry, created hastily in 1942 at a total cost of almost a half billion dollars to supply frequency control units for military radios, manufactured in all approximately 60,000,000 units over the war years. About 24 per cent of the production went into aircraft radios, 20 per cent into tank and other ground vehicle sets, and 42 per cent was used in walkie-talkie and other portable combat radios. The magnitude of the achievement appears when it is considered that the entire prewar industry over the 20-year period from the start in 1921 to 1940 produced less than 300,000 units. The piezoelectric effect itself was discovered in 1881 by Pierre and Jacques Curie and was first put to military use at the close of the First World War when Paul Langevin, in Paris, designed quartz plates for sending out and receiving underwater sound waves for the purpose of submarine detection. The application of the piezoelectric to radio did not come until 1921, when W. G. Cady used vibrating quartz plates to control and stabilize the frequency of vacuum tube oscillators. Quartz found only limited use for submarine detection in the Second World War, other more sensitive electronic devices largely being used for the purpose, but the radio applications were enormous.

One of the major difficulties in establishing the new industry was in obtaining an adequate and continuing supply of raw material. Thousands of tons of raw quartz crystals, averaging roughly \$8 a pound and ranging up to \$25 a pound and more with increasing size and quality were imported from Brazil, where the purchasing and initial grading was carried on under the direction of United States governmental agencies and private importers. A considerable effort also was made to extend and mechanize the primitive mining and distributing industry in Brazil. A stockpile of some millions of pounds of raw quartz was built up in the United States by the Metals Reserve Corporation, the material being graded by the National Bureau of Standards, and this and privately imported quartz was allocated to industry by the War Production Board. During 1942 the supply situation became acute, due to difficulties of sea transport, and considerable amounts of quartz were flown by plane from Brazil to the United States and even to England. Quartz occurs in

Brazil principally in the states of Minas Gerais, Goyaz (Goiatz), and Bahia (Bahia), where it is found in small, widely scattered surface deposits. The mines were worked mainly by the pick and shovel method. Most of the individual deposits afforded only a few tons of quartz at most and were soon worked out. Efforts by government agencies and others to find or develop commercial supplies of quartz within the United States and in other Allied countries proved unsuccessful and only a few tons of domestic quartz, mostly from Arkansas, were processed. Most of the raw quartz used contained natural crystal faces and hence was relatively easy to orient for the preliminary sawing operations. Broken, unfaced quartz was relatively abundant and cheap but efforts made to equip and teach the industry to use this difficult to handle material met with reluctance. An effort was made to grow large quartz crystals artificially, but with no success. Other types of piezoelectric substances, however, in large demand for sonic detecting devices and other war applications were grown artificially in very large amounts, especially the so-called ADP—ammonium dihydrogen phosphate. The artificial substances in general are not comparable to quartz for radio applications because of undesirable physical and chemical properties and their relatively large change in frequency with variation in temperature.

Taking a prewar laboratory-scale quartz cutting industry and equipping it almost overnight on a mass production scale with modern precision tools constituted a major problem. For many types of equipment, especially lapping machines, saws and X-ray units, designs had to be created and then manufacturers found to produce the apparatus. Many of these operations were bolstered with high priorities and financed with government funds through the Defense Supplies Corporation. Most of the equipment was held in Signal Corps pools and allocated to the crystal manufacturers. The stringent specifications set up for most types of oscillator-plates necessitated precise control of cutting angles. Over 300 goniometric X-ray units designed for the purpose were supplied, principally by General Electric and North American Philips, marking the first use of X-rays as a mass production industrial tool. Other difficulties confronting the newly established industry which had to be overcome in the face of insistent demands by the armed services for immediate and large production, were the scarcity of trained personnel, uninformed management, and the general lack of technical information on manufacturing methods and equipment.

Responsibility for procurement of the quartz plates rested largely in the Crystal Section of the Office of the Chief Signal Officer, War Department. This group was supplemented by the Crystal Branches of the Signal Corps Laboratories at Fort Monmouth, N. J., and of the Aircraft Radio Laboratories at Wright Field, Ohio. A great deal of credit is due to these agencies, and also to the Bell Telephone Laboratories, which supplied invaluable technical information, for their work in guiding the development of the industry against extremely adverse conditions. While the postwar use of crystals in radios and telephony will be large as compared with 1939, the present productive capacity of the industry is so great that most manufacturers will be forced to close down.

Technical Symposia on Quartz.—Two symposia of technical papers describing the principles of the design and operation of quartz oscillator plates and reviewing the methods developed for the manufacture of such plates have been written

for publication in the *Monograph Series* of the American Association for the Advancement of Science and in the *Journal* of the Mineralogical Society of America. The latter symposium, already published (*American Mineralogist*, vol. 30, pp. 205-468, 1945), comprises a group of 14 papers concerned primarily with the practical aspects of the field. The geological occurrence and methods of inspecting and grading of raw quartz are discussed, and a detailed description is given of the various methods used to orient the raw crystals preliminary to sawing. The prewar orientation techniques were based on optical and etching methods and on techniques in which mechanical measurements were made from the external growth faces of the raw crystals. These methods permit of an accuracy of orientation of only a few degrees of arc and were supplanted during the war by precision X-ray techniques affording measurements accurate to 5 or so minutes of arc. A high degree of accuracy is needed since several important operating characteristics of the plates depend in a sensitive way on the specific angle at which the plates are cut from the raw crystal. The principal methods of sawing, lapping and finishing quartz oscillator-plates also are described in considerable detail in this symposium but the electronic side of the field is touched only in passing.

Diamonds.—A symposium of 17 papers describing recent researches on the atomic structure and physical properties of the diamond has been published (*Proceedings*, Indian Academy of Sciences, Sect. A, vol. 19, 1944). Sir C. V. Raman discusses the long standing problem of the symmetry of diamond, whether tetrahedral or octahedral, and suggests the existence of four different structure-forms in which the position of the carbon atoms are identical but in which the orientation of the tetrahedral carbon atoms themselves differ. Two of these structure-forms are tetrahedral and two octahedral. Most diamonds apparently consist of one or the other of the tetrahedral forms, or of both in twin position, and correspond to the Type I of Robertson, Fox and Martin showing infra-red absorption. Type II diamonds, the rarer variety, consist of either or both of the octahedral forms. Evidence for the existence of the several forms is found in luminescence effects caused by ultraviolet light and in variations in the intensity of X-ray reflection, the absorption spectra and optical characters. Three types of diamond can be distinguished by absorption in the ultraviolet. The most transparent kind has a sharp cut off at 2250Å; the second kind has a clearly marked absorption band at about 2370Å, with feeble transmission at shorter wave lengths; the third and commonest kind has a cut off at about 3000Å with subsidiary bands at longer wave lengths. Some diamonds exhibit simultaneously more than one and even all three types of absorption spectra. Other studies in the symposium concern the photoconductivity, elastic constants and thermal expansion, magnetic properties and Raman spectra.

The supply of industrial diamonds appears to have been sufficient throughout the war years in the face of greatly increased demand. Especially large amounts have been used in the manufacture of diamond bonded grinding tools and in diamond edged sawing wheels such as are employed in the quartz and ceramic industries. The bulk of the production of industrial diamonds came from the Belgian Congo, notably the Beceka Mine, and smaller amounts were obtained in Brazil, the Gold Coast of West Africa and elsewhere. A large

amount of work has been done in recent years with a view of improving the techniques for preparing industrial diamonds for industrial applications. Mention may be made of the high frequency arc method of drilling diamond dies, and in the use of X-ray goniometers in orienting rough stones preliminary to drilling or cutting.

Miscellaneous Developments.—Two new cobalt and nickel minerals, cattierite (CoS_2) and vaesite (NiS_2), have been detected in ores from the Katanga district, Belgian Congo. X-ray study proves that both minerals are related in atomic structure to pyrite, FeS_2 . In the case of the nickel compound, specimens from other localities have been found which contain varying amounts of iron and are intermediate in properties to pyrite and vaesite; this material has been termed bravoite. Other new minerals described in the present year include jusite, a fibrous zeolite from Württemberg, Germany; banalsite, a barium-rich feldspar from Wales; yenerite, a lead, antimony sulfosalt from Turkey allied to boulangerite; and a hydrous iron sulfate, termed pseudoapatelite, that resembles jarosite. Another new hydrous sulfate of iron, named sharkeyite, has been discovered as an efflorescence on iron ores from Missouri. Two new and rare tellurites of iron from Goldfield, Nev., have been named blakeite and mackayite. The mineral simpsonite, a rare tantalate of calcium, has been found in commercially important amounts in Rio Grande do Norte Province, Brazil. The name brazilianite has been given to another new and beautifully crystallized mineral from Brazil.

Liège Museum.—The museum of the University of Liège, Belgium, was destroyed by fire on the day the city was evacuated by the Germans. The major portion of the display and teaching mineral collections was lost together with the library and most of the research equipment. An appeal to American mineralogists has met with wholehearted response by national and local societies and individuals, and it is hoped that sufficient material will be donated to replenish both the Liège institution and possibly other war ravished museums in Allied countries.

CLIFFORD FRONDEL,
Department of Mineralogy, Harvard University.

MINES, United States Bureau of (Department of the Interior). During the fourth and final year of American military participation in the Second World War, the Bureau of Mines again devoted all of its research and technical facilities to exploring new ore reserves, developing and improving metallurgical processes, conducting investigations and research on coal, petroleum, explosives and other commodities, promoting safety in the mineral industries, and engaging in many other essential services directly related to the prosecution of the war.

The munitions, weapons, and fuels to propel the mechanized equipment which gave immense striking power to the United States military and naval forces were made possible largely by a record-breaking production of minerals and fuels, with private industry performing miracles of mining, processing, and manufacturing. As a federal agency designated by law to aid industry in this type of work, the bureau's scientists played an important role in the development of many of the new production techniques which were advantageously utilized by producers, and in providing industry and the war agencies of government much economic and statistical data essential to accurate planning.

Bureau activities included the delineation of quantities of hitherto unexploited raw materials, metallurgical investigations of new methods of utilizing the vast reserves of low and off-grade domestic mineral deposits, and maintenance of helium production at the same high rate as during the preceding year. To help meet heavy military and industrial fuel requirements, the bureau intensified further its coal, coke, and petroleum research activities, conducted a nation-wide fuel conservation program, and acted as consultant and technical adviser to industrial plants, government war agencies and the military services.

Mineral Exploration.—As the war entered its final and most intensive phase, demand for raw materials required for the production of arms and munitions increased correspondingly. To help meet these unprecedented mineral requirements, the Bureau of Mines conducted exploratory projects on 150 deposits in 36 states and Alaska. In the same period, approximately 850 mineral deposits were examined by bureau investigators. Several million tons of usable iron ore were made known in Arizona, Utah, Alaska, New Jersey, New York, Pennsylvania, Missouri and Virginia, and studies in Alabama showed that usable iron ore may be recovered from tailings. The bureau also investigated 44 deposits of such ferroalloying minerals as manganese, tungsten, nickel and chromium.

In the field of nonferrous metals, exploratory projects conducted by the bureau on 28 lead and zinc deposits in 12 states disclosed large reserves in Illinois, Idaho, Nevada, Kansas and Oklahoma. The Leadville Tunnel—a major drainage project undertaken by the bureau to revive the formerly productive Leadville district in Lake County, Colo.—was advanced 4,800 feet during the past year.

Copper projects in 9 states resulted in the discovery of two important sources of supply in Pima and Coconino counties, Ariz. Continuing the quest for new sources of tin, bureau investigators marked out a promising deposit on the remote Seward Peninsula in Alaska. In Napa County, Calif., a low-grade ore deposit containing the equivalent of 10,000 flasks of mercury was delimited. To stimulate the production of strategic mica, investigations of pegmatites were carried out on six projects in six states.

Large-scale exploration for bauxite, one of the ores of aluminum, was continued in Alabama and Arkansas, and present reserves are estimated at approximately 90 million tons of all grades. Intensive bureau explorations in 11 widely scattered states and Alaska materially increased domestic reserves of such nonmetallic minerals as barite, sillimanite, potash, optical calcite, corundum and asbestos. Discovery of large reserves of sillimanite in the southeastern states greatly reduced the dependence of the United States on foreign imports of this mineral which is utilized in the manufacture of spark plugs and refractories for high-temperature furnaces.

Metallurgical Activities.—Important progress was made in the development of new methods of utilizing the vast domestic reserves of low and off-grade mineral deposits. Because of pilot plant and co-operative investigations in the electrolytic production of manganese, dependence upon foreign sources of supply has been greatly lessened. Construction of experimental ferroalloys pilot plants at Rolla, Mo., and Red-

ding Calif., was continued and plans were completed for a similar plant at Raleigh, N.C. At the bureau's Boulder City electrolytic chromium pilot plant, numerous samples of low-grade Montana chromite were successfully treated. In the course of extensive beneficiation tests on iron ores and sponge iron products, significant advances were made in the hydraulic classification and flotation of Alabama iron ores. Samples of Shasta, Calif., magnetite which had been previously subjected to laboratory beneficiation tests were magnetically separated and the high-grade concentrates reduced at the Laramie, Wyo., sponge iron pilot plant. Investigations of methods of reducing the zircon in Oregon beach sands to zirconium metal were also initiated last year at the Northwest Electrodevelopment Laboratory at Albany, Oreg. Work was continued at several laboratories and pilot plants on the extraction of alumina from low-grade bauxites, clays and alunite. At Salt Lake City, Utah, considerable progress was made in the reduction of the ores of copper, lead and zinc and a pilot plant for reduction of zinc with methane was completed at Rolla, Mo.

Laboratory and pilot plant flotation tests on Metals Reserve Company stockpiles of Spanish, Mexican and domestic fluospar contributed substantially to the increase in commercial drilling of this strategic mineral, while experiments conducted at the Electrotechnical Laboratory at Norris, Tenn., indicated that sillimanite concentrate can be substituted for scarce kyanite in the manufacture of refractory brick.

Petroleum and Natural Gas.—Recognizing the need for augmenting the nation's oil reserves which have been seriously depleted by nearly four years of war, bureau scientists continued their research in the primary extraction of oil, secondary recovery, and chemistry and refining processes. Studies of primary methods of crude oil extraction were intensified in California, in the Rocky Mountain fields, and particularly in the gas-condensate fields of the Gulf Coast region. Engineers studied and reported to the navy on reservoir conditions in Naval Petroleum Reserve No. 1 at Elk Hills, Calif. More than 600 samples of unconsolidated cores were analyzed, and gas liberation and shrinkage data as well as other physical characteristics of reservoir oils were determined.

Petroleum chemistry and refining research during the past year was directed primarily toward achieving the maximum utilization of crude oils in the manufacture of fuels for the latest types of aviation engines. Because of increased military consumption of sulphur-bearing oils, a comprehensive program of research on sulphur in petroleum was inaugurated. During the year, 32 special restricted reports describing several phases of the work on aviation fuels were made available to refiners and members of technical committees.

Helium.—Although the bureau's production of helium for direct military and naval uses declined last year, commercial requirements increased by 65 per cent. To meet the anticipated peacetime demand, excess helium which is being extracted from privately-owned natural gas normally supplying domestic and commercial markets is being injected into the government-owned Cliffside Gas Field. Here in this underground cache it will be held for future needs. In recognition of the outstanding production record for war, the bureau's Otis helium plant received the army and navy "E" award, while the Amarillo

and Exell plants were each awarded a star for their "E" flags. The United States government, through the Bureau of Mines, is the only commercial producer of helium gas in the world.

Research in Coal.—To help meet the fuel requirements of the armed forces and provide a sufficient supply of fuel for normal industrial uses in the postwar era, the bureau conducted an extensive program of coal research during the past year, emphasizing improved preparation and upgrading of coal for special uses, better mining methods, and conservation through more effective utilization. Bureau engineers advised many government agencies in the purchase and utilization of fuels and fuel-burning equipment and sampled more than 20,000 specimens. At a large number of army camps, recommended changes in the operation of equipment saved thousands of tons of coal. The bureau investigated methods of combating corrosion in the condensate return lines of boilers, thus affording better protection for steel equipment valued at approximately \$300,000,000. In co-operation with anthracite producers, the bureau studied the prevention of flooding of operating mines and outlined more efficient methods of mining in steeply pitching anthracite beds. Because of the dwindling supply of high-grade metallurgical coke, the bureau expanded its research in methods of reducing the sulphur and ash content of coking coals and also conducted extensive explorations in western, southern and eastern coal areas for minable reserves of coking fuel. Laboratory coking tests and petrographic examinations of more than 150 coals from the United States, Chile and China were made. To help improve the design and operating efficiency of boiler furnaces, the bureau conducted studies of slag deposits on boiler tubes from melted coal ash. More than 200 ash samples were analyzed and the burning characteristics of emergency fuels were determined. For the first time in the United States, the electron microscope was used to determine surface area and size distribution of powdered coal. With the assistance of nearly 20,000 volunteers and more than 13,000 industrial plants, the bureau successfully conducted a nationwide fuel efficiency program directed at conserving all types of fuel and heat energy.

Gas- and Dust-Explosion Research.—To reduce explosion hazards in coal mines and in many types of plants, tests were made on industrial powders, dusts and vapor-air mixtures, and recommendations and safety codes were formulated for minimizing or preventing explosions in plants producing explosive materials.

Synthetic Liquid Fuels.—Construction was started on three of the four major installations in the bureau's five-year synthetic liquid fuels program, designed to provide the "know how" for industry to produce gasoline and oil from coal, lignite, and oil shales. Buildings were being erected and equipment installed for a coal research and development laboratory at Bruceton, Pa., where a staff of more than 100 scientists already is engaged in fundamental research work, process development, and engineering design, in temporary quarters. At Laramie, Wyo., a laboratory for research on oil shale is under construction, and satisfactory progress was made in the construction of an oil shale demonstration plant on the naval oil shale reserve near Rifle, Colo. An oil-shale mine was opened here to supply the plant and to enable the bureau to develop low-cost methods of mining oil

shale. Until the plant and laboratory are completed, studies of the production of marketable oil products from oil shale is being carried on in temporary quarters.

A fourth major unit in the bureau's five-year synthetic liquid fuels program—a demonstration plant for the production of gasoline and oil from coal and lignite—also came into being later in 1945, when the bureau acquired from the War Department a \$17,500,000 synthetic ammonia plant known as the Missouri Ordnance Works, at Louisiana, Mo. This plant, which is to be converted into a demonstration plant for the large-scale testing of processes developed at the Bruceton, Pa., laboratory, will save the government several million dollars in construction costs and is expected to accelerate the federal synthetic liquid fuels research and demonstration program.

Explosives Research and Testing.—Promoting safety and efficiency in the manufacture and handling of explosives, the bureau made more than 5,000 analyses, including 419 chemical analyses, 2,717 gallery tests and 2,029 other control tests. Five permissible explosives were added to the list of approved explosives which now contains 178 names. In co-operation with the army and navy, studies of the dangers inherent in large-scale storage of explosives were continued. The bureau investigated acetylene generator explosions in shipyards, explored the causes of a disastrous fire following the failure of a storage tank containing liquefied natural gas at Cleveland, Ohio, and made a study of the conditions under which the permissible charge for blasting coal may be safely increased. In developing a new test for detonators, bureau explosives engineers invented an electronic chronoscope capable of measuring time intervals of a millionth of a second.

Promotion of Health and Safety.—Shortages of manpower and equipment, as well as the continued need for increased production of minerals, gave added impetus to the bureau's safety and security programs during the past year. Major activities included accident-prevention training, safety education, accident investigations, testing of materials and equipment, field and laboratory studies of the occurrence of gases, dust, temperatures and other conditions affecting the health of mine workers, coal mine inspections and reports, explosives control, and co-operation with the armed forces in the prevention of sabotage. Federal inspectors last year examined more than 3,000 coal mines. Bureau safety engineers trained over 18,000 employees in first-aid and mine-rescue procedures, assisted in conducting first-aid contests in five states, gave about 1,200 workers and officials complete accident prevention courses and approximately 600 partial courses, and attended 494 safety meetings in 29 states. Assisting in mine-rescue and recovery operations at virtually all major mine disasters occurring during the year, bureau personnel investigated 31 mine explosions in 12 states, 52 mine fires in 21 states, and 132 miscellaneous accidents in 30 states.

During the year, the bureau conducted 1,327 explosion tests to determine the permissibility of electrical equipment in mines, and special investigations of the safe design of equipment intended for naval use were continued. Protecting the lives of the thousands of workers in mine and industrial plants, the bureau analyzed approximately 19,000 gas and dust samples, improved procedures for determining atmospheric contaminants, made many recommendations for eliminating unhygienic conditions, tested the ef

fectiveness of respiratory protective devices, and, in co-operation with the Navy Department conducted confidential studies to determine the toxic gases produced by the decomposition of cable insulation and plastic materials used in electrical equipment. Dust studies were made in more than 50 bituminous and anthracite mines.

Mineral Production Security Program.—Ended officially on June 30, 1945, the Minerals Production Security Division was responsible to an appreciable extent for the prevention of subversive activities in the minerals industry during the Second World War. Acting in co-operation with the army, the navy, FBI, and other groups, bureau security engineers made surveys at 36 previously uninspected facilities, and conducted 395 reinspections, making a total of 1,598 reinspections during the past three years.

Explosives Control.—Completing more than three and one-half years of successful administration of the Federal Explosives Act, the bureau last year issued approximately 90,000 licenses through 3,900 volunteer licensing agents and special investigators inspected more than 16,000 individual magazines. Although 750,000 licenses have been issued under the Federal Explosives Act, only 56 licenses have been revoked. Of this total 14 licenses have been restored upon the assurances of licensees that they would comply with the act in the future.

Economics of the Mineral Industries.—The demand for the bureau's economic and statistical services continued to be heavy last year, and in addition to providing government war agencies with accurate and up-to-the-minute figures on production, distribution and consumption of all mineral commodities, the bureau's economic and statistical information proved a valuable tool in keeping accident rates within bounds under difficult war conditions. More information on foreign mineral sources was gathered and the bureau's economic and statistical program was expanded to provide basic information required by the government in dealing with the surplus scrap problem. War experience demonstrated the need for advance stockpiling of certain domestically-scarce minerals, and the bureau's commodity specialists co-operated extensively with the military services in the analysis of the problem.

Public Reports.—In response to a rising demand from industry, war agencies, and the public for information on all phases of the mineral industries, the bureau published numerous technical and statistical reports, but the number of copies printed and distributed was restricted to essential publications. Among the 660 publications released by the bureau were bulletins, technical papers, *Mineral Yearbook* chapters, miners' circulars, reports of investigations, information circulars, and numerous periodic statistical reports for industry. The bureau's Washington library of selected reference materials was increased by 2,351 books and pamphlets, and 207 bound volumes of periodicals. In addition, 247 periodicals were received regularly and 19,611 publications were loaned for outside use. Free educational films produced under the bureau's supervision and paid for by private industry were in constant demand for war-training and rehabilitation classes, engineering and scientific societies, civic groups, educational institutions, and military centers in the United States and in many foreign countries. The films were exhibited on 84,959 occasions and reached audiences totaling 7,932,361 persons. Three new sound films, *A Story of Copper*, *Sand and Flame*, and *A Story of Arc*

Welding, were added to the bureau's library of more than 10,000 reels.

R. R. SAYERS,
Director, United States Bureau of Mines.

MINNESOTA. West North Central state, United States; admitted to the Union May 11, 1858. Population (1940): rural, 1,402,202; urban, 1,390,098; total, 2,792,300. Land area, 80,009 square miles, divided into 87 counties. Principal cities, with 1940 populations: Minneapolis, 492,370; St. Paul, the capital, 287,736; Duluth, 101,065; Rochester, 26,312; St. Cloud, 24,173; Winona, 22,490.

Chief State Officers, 1945.—Governor, Edward J. Thye; lieutenant governor, C. Elmer Anderson; secretary of state, Mike Holm; treasurer, Julius A. Schmahl; auditor, Stafford King; attorney general, J. A. A. Burnquist.

Judiciary.—Chief justice of the Minnesota Supreme Court, Charles Loring; associate justices, Julius J. Olson, Harry H. Peterson, Luther W. Youngdahl, Thomas Gallagher, C. R. Magney, LeRoy E. Matson.

Legislature.—The state legislature (Senate, 67 members; House of Representatives, 131) convenes biennially in odd years, on Tuesday after the first Monday in January.

Education.—Public elementary schools (latest report, 1943-44 school year), 8,195; teachers, 12,196¹; pupils, 313,658¹. Public junior high schools, 159; teachers, 1,324; students, 52,073. Public senior high schools, 495; teachers, 6,254; students, 112,300. Education in Minnesota is compulsory for all children between the ages of 8 and 16, inclusive. There are six state teachers colleges. The University of Minnesota receives financial aid from the state. Total state appropriation for education (1944), \$14,723,951²; by cities and counties, \$37,510,791³.

Finances.—The following figures regarding Minnesota's finances for the fiscal year 1944-45 were furnished by the state treasurer's office:

Auditor's cash balance in treasury, beginning of fiscal year 1944-45.....	\$ 34,072,419.39
Receipts, 1944-45	170,762,667.11
Total	\$204,835,086.50
Disbursements, 1944-45	164,734,383.25
Auditor's cash balance, beginning of fiscal year 1945-46.....	\$ 40,100,703.25 ¹

¹ Does not include \$199,357,163.30 in trust and related fund invested assets.

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.).....	163,330	253,399	217,440
Oats (1,000 bu.).....	140,307	155,960	243,938
Buckwheat (1,000 bu.).....	237	945	615
Wheat (1,000 bu.).....	23,596	20,689	21,910
Barley (1,000 bu.).....	44,401	13,884	14,442
Rye (1,000 bu.).....	5,197	1,221	2,178
Flaxseed (1,000 bu.).....	9,751	6,514	12,375
Hay:			
Alfalfa (1,000 tons).....	2,234	2,090	2,038
Clover and timothy (1,000 tons)	1,044	1,550	1,771
Tame (1,000 tons).....	4,432	4,679	4,786
Wild (1,000 tons).....	1,448	1,493	1,523
Soybeans for beans (1,000 bu.).....	993	4,340	6,460
Tobacco (1,000 lb.).....	550	744	840
Potatoes (1,000 bu.).....	20,360	15,334	17,490
Apples (1,000 bu.).....	208	182	190

¹ Kindergarten and spring primary included.

² Including \$74,000 appropriated for training armed forces.

³ Total expenditures for public elementary and secondary schools, minus state aids. Certain county appropriations are not included.

MINT ESTABLISHMENT, United States. The production of domestic coin by the United States mints during the fiscal year ended June 30, 1945, amounted to 2,646,134,101 pieces, which exceeded by 67,493,831 pieces the record production of the previous year. In 1944-45, 1,388,971,000 coins were manufactured for other governments, the largest single year's production of foreign coinage. The total coinage, domestic and foreign, amounted to 16,488½ tons, or an average of 46 tons per day.

Manufacture of the 1-cent piece from expended cartridge shells has been recently discontinued, and the mints have returned to the prewar method of making this coin. (Manufacture of the zinc-coated steel cent had been discontinued Dec. 31, 1943, at the time the shell cases were made available for use in the coinage of this denomination.)

The design for the Roosevelt dime has been approved, and production of the new coin will start Jan. 1, 1946. The design is by John R. Sinnock, of the Philadelphia Mint.

Production of medals for the navy, coast guard, marines and army exceeded that of any previous year, as orders continued heavy from the armed services. Among those manufactured were Distinguished Flying Crosses, Air medals, Bronze Star medals, Navy Crosses, Navy Expert Rifleman medals, Navy Expert Pistol Shot medals, Navy small gold stars, Legion of Merit medals, Silver Star medals and Purple Heart medals. Roosevelt Memorial and Truman presidential medals have been added to the list of historic medals made at the Philadelphia Mint, and are for sale to the public.

During the fiscal year 1945, \$35 per fine troy ounce was paid for gold, while newly-mined domestic silver was purchased at \$.71+ per fine ounce. The open market price of silver in New York (mean of bid and asked) was \$.45062 per fine ounce.

During the year \$65,290,844 in gold was sold by the Treasury for industrial use; 68,147,835 fine ounces of silver were sold under the Green Act at a price of \$.71+ per ounce; 119,837,110 fine ounces of silver were issued under lend-lease procedure, and 877,715,175 ounces of silver were on loan to war industries as of June 30, 1945.

At the end of the fiscal year 1945, the Treasury holdings of gold bullion amounted to \$20,212,838,145, and the stock of silver bullion was 1,875,355,592 fine troy ounces.

After the end of the war in Europe, experts from the United States Mint service were sent to Germany to assist in checking and identifying the tremendous hordes of gold and other precious metals found in the Merkers salt mines, and in numerous other secret caches.

LELAND HOWARD,
Acting Director of the Mint.

MIQUELON ISLANDS. See SAINT PIERRE AND MIQUELON.

MISSISSIPPI. East South Central state, United States; admitted to the Union Dec. 10, 1817. Population (1940): rural, 1,750,914; urban, 432,882; total, 2,183,796. Land area, 47,420 square miles, divided into 82 counties. Chief cities, with 1940 populations: Jackson, the capital, 62,107; Meridian, 35,481; Vicksburg, 24,460; Hattiesburg, 21,026; Greenville, 20,892; Laurel, 20,598.

Chief State Officers, 1945.—Governor, Thomas L. Bailey; lieutenant governor, Fielding Wright; secretary of state, Walker Wood; treasurer,

Newton James; comptroller, Joe Latham; attorney general, Greek L. Rice.

Judiciary.—Chief justice of the Mississippi Supreme Court, Sydney Smith; associate justices, V. A. Griffith, W. G. Roberts, Harvey McGehee, Julian Alexander, and L. A. Smith.

Legislature.—The state legislature (Senate, 49 members; House of Representatives, 140) convenes biennially in even years on Tuesday after the first Monday in January.

Education.—Public elementary schools (latest report, 1943-44 school year), 1,319; teachers, 3,328; pupils, 487,330; average yearly salary of elementary school teachers, \$818. Public high schools (1943-44), grades 9 through 12, 565; teachers, 1,197; students, 67,426; average yearly salary of high school teachers, \$883. Education in Mississippi is compulsory for all children between the ages of 7 and 16. There are four teacher-training schools, two for whites and two for Negroes. These receive financial aid from the state, as do the following: the University of Mississippi, Oxford; Mississippi State College, Starkville; and Mississippi State College for Women, Columbus. Total state appropriation for education (1943-44), \$8,787,097; appropriation by cities and counties (1943-44), \$9,871,798.

Finances.—Following is a statement of Mississippi's finances for the fiscal year 1944-45, supplied by Newton James, state treasurer:

Balance in treasury, beginning of fiscal year 1944-45:	
General fund	\$ 8,696,979.69
Trust fund	5,972,282.21
	<hr/> \$14,669,261.90
Receipts, 1944-45:	
General fund	\$36,878,003.55
Trust fund	27,991,745.50
	<hr/> \$64,869,749.05
Disbursements, 1944-45:	
General fund	\$26,800,662.16
Trust fund	26,198,358.11
	<hr/> \$52,999,020.27
Balance, beginning of fiscal year 1945-46:	
General fund	\$18,774,321.08
Trust fund	7,765,669.60
	<hr/> \$26,539,990.68

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.).....	44,412	42,224	48,886
Oats (1,000 bu.).....	4,900	15,096	15,477
Cotton (1,000 bales)...	1,677	1,937	1,670
Hay:			
Tame (1,000 tons)...	944	1,067	1,193
Soybeans for beans (1,000 bu.).....	721	1,150	1,131
Peanuts (1,000 lb.)...	16,151	12,555	13,000
Pecans (1,000 lb.)...	5,920	8,300	7,830
Sweet potatoes (1,000 bu.)	6,499	6,248	6,592
Potatoes (1,000 bu.)...	1,423	2,210	1,836
Peaches (1,000 bu.)...	886	1,105	1,418
Pears (1,000 bu.).....	360	354	401

MISSOURI. West North Central state, United States; admitted to the Union Aug. 10, 1821. Population (1940): rural, 1,823,968; urban, 1,960,696; total, 3,784,664. Land area, 69,270 square miles, divided into 114 counties and the City of St. Louis. Principal cities, with 1940 populations: St. Louis, 816,048; Kansas City, 399,178; St. Joseph, 75,711; Springfield, 61,238; Joplin, 37,144; University City, 33,023; Jefferson City, the capital, 24,268.

Chief State Officers, 1945.—Governor, Phil M. Donnelly; lieutenant governor, Walter N. Davis; secretary of state, Wilson Bell; treasurer, Robert

W. Winn; auditor, Forrest Smith; attorney general, J. E. Taylor.

Judiciary.—Chief justice of the Missouri Supreme Court, James M. Douglas; associate justices, Albert M. Clark, George Robb Ellison, Ernest S. Gantt, C. A. Leedy, Jr., Laurance M. Hyde, Ernest M. Tipton.

Legislature.—Missouri's General Assembly (Senate, 34 members; House of Representatives, 150) meets biennially in odd years on the first Wednesday after the first day of January.

Education.—Public elementary schools (latest report, 1943-44 school year), 7,485; teachers, 17,344; pupils, 483,510; average yearly salary of elementary school teachers, \$1,142. Public senior high schools (1943-44), 832; teachers, 6,994; students, 148,305; average yearly salary of senior high school teachers, \$1,771. There are five state teacher training schools. These plus the University of Missouri and Lincoln University (for colored) receive financial aid from the state. Total state appropriation for education (1943-44), \$22,356,822¹; appropriation by cities and counties (1943-44), \$35,424,272. Education in Missouri is compulsory for children between the ages of 6 and 16, inclusive.

Finances.—Following is a statement of Missouri's finances for the 1944 fiscal year, supplied by the state treasurer's office:

Balance in treasury, beginning of 1944 fiscal year	\$ 50,129,780.87
Receipts, 1944 fiscal year	113,560,088.53
Total	\$163,689,869.40
Disbursements, 1944 fiscal year	104,154,582.73
Balance, beginning of 1945 fiscal year	\$ 59,535,286.67

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.)	102,409	162,554	117,477
Oats (1,000 bu.)	42,694	29,970	31,960
Wheat (1,000 bu.)	26,438	23,800	24,360
Barley (1,000 bu.)	2,550	1,800	1,463
Rye (1,000 bu.)	512	840	847
Sorghums for grain (1,000 bu.)	981	1,617	1,020
Cotton (1,000 bales) ..	348	411	200
Hay:			
Alfalfa (1,000 tons) ..	576	806	813
Clover and timothy (1,000 tons)	904	900	1,000
Tame (1,000 tons)	2,937	3,481	3,688
Soybeans for beans (1,000 bu.)	2,397	10,605	10,770
Sweet potatoes (1,000 bu.)	798	800	665
Tobacco (1,000 lb.)	5,039	7,760	7,400
Potatoes (1,000 bu.)	3,844	2,232	2,992
Apples (1,000 bu.)	1,404	660	817
Peaches (1,000 bu.)	695	315	1,026
Pears (1,000 bu.)	354	175	350
Grapes (tons)	7,490	6,500	6,400

MITSCHER, Marc Andrew, United States naval officer: b. Hillsboro, Wis., Jan. 26, 1887. One of the Pacific war's most colorful combat officers, Vice Admiral Mitscher commanded the famous aircraft carrier *Hornet* at the beginning of the war with Japan; it was from her decks that General Doolittle's airmen took off on April 18, 1942, for the first American bombing raid on Tokyo. On June 4-6, Admiral Mitscher brought the *Hornet* through the battle of Midway. In January-February 1944, he directed carrier force operations against the Marshall Islands, Truk and Tinian-Saipan Islands, and later assumed command of the much publicized and deadly

¹ Figure does not include state appropriations to the above mentioned colleges and universities.

Task Force 58, which scored so heavily against the Japanese Fleet in the battle of the Philippine Sea, June 20, 1944. For the brilliant victory over Japan's navy on Oct. 22-30, 1944, in the vicinity of Mindoro, the Sulu Sea, and northeast of Luzon, he commanded Task Force 38, attached to Admiral Halsey's Third Fleet. Between January and May 1945, he directed task force attacks against the enemy in support of amphibious operations at Iwo Jima and Okinawa; on April 7, his aircraft accounted for the Japanese battleship *Yamato*, a light cruiser, and four destroyers. On May 11, Admiral Mitscher's flagship, the *Bunker Hill*, was hit by two Japanese suicide planes, with a loss of 373 killed, 264 wounded. Himself uninjured, Mitscher transferred to another warship. On July 14, 1945, he replaced Vice Admiral Aubrey W. Fitch as deputy chief of naval operations for air. On December 4, the Navy Department announced that Admiral Mitscher would become commander of the Eighth Fleet in the Atlantic under naval reorganization plans. Admiral Mitscher is a graduate of the United States Naval Academy (1910), and received his flight training at the Naval Air Station, Pensacola, Fla. His service awards include the Navy Cross; two gold stars in lieu of second and third navy crosses; the Distinguished Service Medal; two gold stars in lieu of second and third DSM's; the Legion of Merit; and the Philippine Liberation Service Medal.

MOLDAVIAN SOVIET SOCIALIST REPUBLIC.
See UNION OF SOVIET SOCIALIST REPUBLICS.

MOLOTOV, Vyacheslav Mikhailovich, Soviet statesman: b. Kirov, Kirov, USSR, March 9, 1890. Russia's Vyacheslav Molotov is, in the opinion of many, second only to Stalin in political power. Foreign commissar since 1939, succeeding Maxim Litvinov, and since May 1941, vice premier of the USSR, he is also a member and vice chairman of the powerful State Defense Committee. Molotov identified himself with the Russian revolutionary movement in 1905, taking part in the first organized rebellion against the czarist regime. He later wrote for revolutionary newspapers, and during one period edited *Pravda*, official organ of the Communist Party. He was repeatedly imprisoned for his organizational work. By February 1917, he was a member of the Petrograd Soviet Executive Committee, and in 1921, was elected secretary of the Central Committee of the Communist Party for the entire Soviet Union, and candidate member of the Political Bureau. Since 1926, he has been a member of the Political Bureau of the Communist Party. He became chairman of the Council of Peoples' Commissars (premier) in December 1930, and held that post until the spring of 1941, when he was replaced by Stalin. His appointment as foreign commissar in May 1939 marked a radical change in Soviet foreign policy which was followed by Russia's signing of a nonaggression pact with Germany in August. Molotov assumed his duties as vice chairman of the State Defense Committee shortly after the Nazi invasion of the Soviet Union (June 1941). On July 12, he signed the Russo-British mutual aid pact, and in May 1942, he went to England to conclude the 20-year Russo-British mutual assistance agreement. From London he went to Washington, and negotiated a lend-lease agreement with the United States. In April 1943, the Russo-Polish controversy exploded into news headlines with Molotov's announcement of the Soviet Union's suspension of diplomatic relations

with the London Polish government in exile. From October 1930, he presided at a three-power conference in Moscow with British Foreign Minister Anthony Eden and United States Secretary of State Cordell Hull, and from November 28–December 1, he attended the Teheran Conference with Marshal Stalin. In the latter month he signed the Czecho-Soviet mutual assistance pact. With the Polish dispute still political dynamite in April 1944, Molotov conferred in Moscow with Stanislaus Orlemanski, Catholic priest from Springfield, Mass., an advocate of Russo-Polish collaboration, and the following October, he met with Polish President Stanislaw Mikolajczyk with regard to his government's conflict with the London Poles. He had a few days previously attended a series of war conferences with British Prime Minister Winston Churchill, Foreign Minister Eden, and Averell Harriman, United States ambassador to Russia. In early February 1945, he accompanied Stalin to the Yalta Conference and in April, headed the Soviet delegation to the San Francisco Conference. He attended the meeting of the Big Three in Berlin, July 17–August 2, and in September, went to London as a member of the Council of Foreign Ministers. In December he participated with British Foreign Minister Bevin and United States Secretary of State James F. Byrnes in the Moscow Conference of Foreign Ministers.

MOLUCCA. See NETHERLANDS INDIES.

MONACO. A small principality on the northern shores of the Mediterranean, since 1860 surrounded by the French department of Alpes Maritimes, except for its harbor and a strip of seacoast. It is a narrow body of land between Nice and Menton, with an area of 370 acres and a population (1939) of 23,973. Since 968 (except between 1793 and 1815) it had been the property of descendants of the house of Grimaldi, the reigning Prince being an absolute ruler until 1911, when a constitution was promulgated providing for an Assembly of 21 elected members and a Council of State. The territory is divided into three communes, Monaco, La Condamine, and Monte Carlo, the last being the site of the famous gambling casino from which practically all the revenue of the principality is derived. Perfume and liqueurs are manufactured in La Condamine, and there is some exportation of perfumes, oranges, and olive oil; coal and wine being the chief imports. There is a small sheltered harbor. Customs duties are the same as in France. Prince Louis II, who succeeded his father, Prince Albert I, upon the latter's death on June 26, 1922, was born July 12, 1870. During the last year of the Second World War the Germans forced Monaco to expel alien residents and to exclude tourists, and subjected the life of the principality to controls (rationing, etc.) similar to those imposed on France, including an 8 o'clock curfew.

MONGOLIA. The term Mongolia was formerly applied to the region occupying some 1,500,000 square miles in central Asia, inhabited by the Mongols, with an estimated population of between 2,500,000 and 4,000,000. As used in 1945, however, Mongolia was generally understood to mean Outer Mongolia, the Mongolian Republic (q.v.). The middle portion of the original Mongolia, some 325,000 square miles in extent, comprised the Gobi, or Shamo Desert. The region as a whole coincided roughly with the great plateau, 3,000 to 5,000 feet above sea level, bounded on the north by the Altai and

Sayan Mountains, on the east by the Greater Khingans, and on the west by the northeasternmost ranges of the Himalayas. This territory was formerly under the nominal suzerainty of the Manchu emperors of China. Soon after the beginning of the Chinese Revolution, in 1911, Outer Mongolia, which later became the Mongolian Republic, emerged as an autonomous state. Inner Mongolia (q.v., later to figure as the Japanese-controlled state of Meng Chiang, 1939–Aug. 1945), was reorganized into administrative districts and became more closely integrated with China.

The social organization of the Mongols, who are largely nomadic, particularly in the Gobi Desert region and its surrounding areas, has been similar to that of biblical times. Families are united into tribes, called "hoshuns." The hoshuns, and the leagues into which they are formed are largely controlled by the nobles, who claim direct descent from Genghis Khan, Tamerlane, or other celebrated Mongol rulers. The prevailing religion is Buddhist Lamaism, the number and political influence of its monks or lamas being much less than formerly. The Gobi Desert region was formerly an important trade transit area between China and the more westerly parts of central Asia, but trade was greatly reduced during the Sino-Japanese war. The leading occupation of the people is the raising of cattle, camels, sheep, and horses. It has been estimated that the plains of Mongolia, fully developed as a stock raising area, could support 25,000,000 horses, 12,000,000 camels, and 75,000,000 sheep, enabling its people, particularly through their production of mutton, hides, hair, and wool, to take a significant share in supplying the world's needs.

MONGOLIAN REPUBLIC (OUTER MONGOLIA). A republic of central Asia, bounded on the north by Siberia and Tannu Tuva, on the east by Manchuria (Manchukuo), on the south by Meng Chiang (Inner Mongolia), (qq.v.) and on the west by Sinkiang. It has an area of about 622,744 square miles, the southeastern portion lying in the Gobi Desert, and a population estimated roughly in 1943 at 676,000, nearly 580,000 of whom are Mongols. Tannu Tuva, once a part politically of Outer Mongolia, is now an autonomous region of the Russian Soviet Federated Socialist Republic, an integral part of the Soviet Union.

Outer Mongolia had been under nominal Chinese suzerainty. In 1921 the Outer Mongolian People's Republic was set up by the Northern Mongols, and in 1924 was reconstituted on the Soviet model. Between 1936 and August 1945 its independence was guaranteed by the Soviet Union through a mutual assistance pact. According to a provision of the Sino-Soviet treaty of Aug. 14, 1945, full recognition of Outer Mongolian independence was also to be accorded by China (as well as by the Soviet Union) if the people of the country expressed the desire for this in a plebiscite. The plebiscite, which was reported on October 22, resulted in an almost unanimous vote in favor of such independence. Government powers are vested in a parliament (the Great Huraldan), elected by universal suffrage, from which an executive committee of 30 members (the Little Huraldan) is chosen, which is responsible to the popularly elected body. Five members of the executive committee are elected as a board to carry on state affairs. The chief towns are Ulan Bator Khoto (Urga), the capital

(population est. 1941, 100,000), Altan Bulak (Maimachen 20,000, in 1939), Uliassutai, and Kobdo.

The prevailing religion, Buddhist Lamaism, at one time drew about a third of the male population into its religious orders, but its influence has since been greatly reduced. The Mongol Republic is nearly as large as the United States east of the Mississippi and Ohio rivers, but its population is less than that of Baltimore. All lands, forests, minerals, and marine products are collectively owned. Farmers are being settled on the land, with material and technical assistance. A large proportion of the population, however, are still herdsmen, largely nomadic, sheep constituting perhaps 50 per cent of the estimated total of 25,000,000 livestock animals, but there are large numbers of cattle, goats, horses, and camels. Hides and wool, sent out mainly through the Soviet Union, were the leading prewar exports, which reached an annual value, equivalent to about \$12,500,000 in American money, imports amounting to nearly the same sum. Industries, chiefly shoe factories, tanneries, and woolen mills, are mainly confined to Ulan Bator, the capital, which, with its government agencies, schools, newspapers, and expanding communication facilities, is described in a recent number of the *National Geographic News Bulletin* (April 7, 1944) as "the heart of this Asiatic heartland." See also MONGOLIA.

MONTANA. Mountain state, United States; admitted to the Union Nov. 8, 1889. Population (1940): rural, 347,921; urban, 211,535; total, 559,456. Land area, 146,316 square miles, divided into 56 counties. Chief cities, with 1940 populations; Butte, 37,081; Great Falls, 29,928; Billings, 23,261; Missoula, 18,449; Helena, the capital, 15,056; Anaconda, 11,004.

Chief State Officers, 1945.—Governor, Sam C. Ford; lieutenant governor, Ernest T. Eaton; secretary of state, Sam W. Mitchell; treasurer, George T. Porter; attorney general, R. V. Bottomly.

Judiciary.—Chief justice of the Montana Supreme Court, Howard A. Johnson; associate justices, Albert H. Angstman, Claude F. Morris, Hugh R. Adair, E. K. Cheadle.

Legislature.—The Legislative Assembly (Senate, 56 members; House of Representatives, 90) convenes biennially on the first Monday in January.

Education.—Public elementary rural schools (one- and two-room) in 1944-45, 1,214; teachers, 1,309; pupils, 12,778. Public elementary urban schools (including 6 kindergartens), 326; teachers, 2,098; pupils, 53,819; average yearly salary of all elementary school teachers, \$1,474. Public high schools, 190; teachers, 1,307; students, 24,605; average yearly salary of high school teachers, \$1,697. Education in Montana is compulsory for all children between the ages of 8 and 16, inclusive. There are two state teacher training schools. Total state appropriation for education (1945), \$3,030,945.08. State superintendent of public instruction, Miss Elizabeth Ireland.

Finances.—The following figures covering Montana's finances for the fiscal year 1944-45 were supplied by the state treasurer's office:

Balance in treasury, beginning of fiscal year 1944-45	\$28,478,094.20
Receipts, 1944-45	32,027,216.28
Total	\$60,505,310.48
Disbursements, 1944-45	26,947,469.65
Balance, beginning of fiscal year 1945-46	\$33,557,840.83
Investment balance, July 1, 1945	\$23,667,254.86

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.)	2,265	3,308	1,918
Oats (1,000 bu.)	10,362	15,717	11,938
Wheat (1,000 bu.)	47,572	73,884	60,858
Barley (1,000 bu.)	5,537	16,290	14,925
Rye (1,000 bu.)	453	378	300
Flaxseed (1,000 bu.)	942	1,453	1,232
Sugar beets (1,000 short tons)	820	682	943
Peas, dry field (1,000 bags)	329	456	336
Hay:			
Alfalfa (1,000 tons)	975	1,159	1,183
Clover and timothy (1,000 tons)	242	299	325
Tame (1,000 tons)	1,571	1,817	1,828
Wild (1,000 tons)	524	616	616
Beans, dry edible (1,000 bags)	274	240	212
Potatoes (1,000 bu.)	1,700	2,520	2,520
Apples (1,000 bu.)	325	400	280
Cherries (tons)	333	1,080	880

MONTGOMERY, Sir Bernard Law, British Army officer; b. Donegal, Ireland, Nov. 16, 1887. Commander of all Allied ground forces for the initial phases of the invasion of Europe, and later chief of the Twenty-first Army Group, Field Marshal Montgomery is one of the most colorful figures to emerge from the Second World War. He went to France with the BEF in 1939 as a division commander, and in May-June 1940, helped effect the British evacuation at Dunkerque. In December 1941, he became commanding general, South Eastern Command, vital post in the British Army's ring of steel against possible German invasion. In mid-August 1942, he succeeded Lieut. Gen. Neil M. Ritchie as commander of the Army of the Nile, the British Eighth. The Eighth's pursuit of Rommel's Afrika Korps across 1,750 miles of Africa from the gates of Alexandria, Egypt, to victory in Tunisia is already legend. Montgomery later took part in the brief Sicilian campaign, and on Sept. 3, 1943, landed his forces on the Italian mainland. He became ground force commander under General Eisenhower in December 1943 for the invasion of the European continent from the west, and in August 1944, chief of the Twenty-first Army Group. On Sept. 1, 1944, he was designated field marshal. On May 4, 1945, he accepted the surrender of all German forces in the Netherlands, northwest Germany, Denmark, Helgoland, and the Frisian Islands, and on May 22, was appointed chief of British occupation forces and British member of the Allied Control Commission in Germany. Montgomery received Russia's highest award, the jeweled Order of Victory, on June 10, and the following day, was presented with the Distinguished Service Medal by General Eisenhower.

Montgomery was knighted by King George in November 1942 for his achievements in North Africa, and was created viscount on Jan. 1, 1946.

MORAVIAN CHURCH. Its real name is "Church of the United Brethren in the United States of America." It is the largest of a number of groups which trace their spiritual ancestry back to the "reformer before the Reformation," John Hus of Bohemia, who died at the stake in 1415. This

church is an integral part of the Unitas Fratrum, a genuinely international organization. It holds all the Protestant doctrines as found in the Bible; specializes on evangelism, education and foreign missions. In America there were in 1945, 113 pastors, 145 congregations, with a membership of 40,674. At that time the world statistics were 601 congregations and a membership of 265,463. Of these, 337 were foreign mission congregations, having a membership of 175,874. These figures are inaccurate only in cases where war conditions made it impossible to obtain reports. The average contribution per member in the United States for home support and benevolence combined amounted to \$26.34. In 1945 plans were in preparation for a world conference of Moravians early in 1946 either in England or in the United States. In Germany the church suffered serious property loss by war. Most of the congregations are in the area controlled by Russia.

S. H. GAPP,

President, Moravian Church in America.

MORGAN, Thomas Hunt, American zoologist: b. Lexington, Ky., Sept. 25, 1866; d. Pasadena, Calif., Dec. 4, 1945. Dr. Morgan received his B.S. and M.S. degrees from the State College of Kentucky in 1886 and 1888 respectively, and his Ph.D. degree from Johns Hopkins University in 1890. He served as professor of biology at Bryn Mawr College from 1891 to 1904, and as professor of experimental zoology at Columbia University from 1904 to 1928, when he became professor of biology and director of the William G. Kerckhoff Laboratories of Biological Sciences of the California Institute of Technology. In 1933 he was awarded the Nobel Prize in medicine for his discoveries concerning the laws and mechanism of heredity.

Without Dr. Morgan's conception of the gene and his now confirmed theory of the way genes cross over in the egg from one parent to the other, there would hardly be a science of genetics. Most of his researches were conducted with fruit flies, which reproduce rapidly. He studied hundreds of pure fruit-fly strains and eventually, with much mathematical work, arrived at his theory of gene linkages and threw much light on the way chromosomes, in which genes are contained, are divided between parents and reunited in offspring. Dr. Morgan reduced the problem of heredity to one of physics and chemistry, the gene being an organic compound which has the miraculous property of determining the form, size, and properties of any living organism. Dr. Morgan was president of the National Academy of Science from 1927 to 1931, and president of the International Congress of Genetics in 1932. He was the author of *Regeneration* (1901); *Mechanism of Mendelian Heredity* (1915); *Embryology and Genetics* (1933), and other books.

MORMONS (THE CHURCH OF JESUS CHRIST OF LATTER DAY SAINTS). Elders Rufus K. Hardy and Samuel O. Bennion, members of the First Council of the Seventy, died on March 7 and 8, 1945, respectively. On April 6, at the semi-annual conference of the church, Elders S. Dilworth Young and Milton R. Hunter were called to fill the vacancies in this council.

Heber J. Grant, president of the church since Nov. 23, 1918, died in his 89th year on May 14, 1945. During his long administration of church affairs, President Grant saw the church membership increase from 479,648 to 954,004; the stakes from 79 to 149; the wards and independent

branches from 871 to 1,273; the missions from 24 to 39. He dedicated three of the seven existing temples of the church. Hundreds of meeting-houses were built under his direction. The 27 years of his administration were a period of steady growth and development. President Grant also held the longest record of service among the general authorities of the church (63 years), having been called to the apostleship in 1882.

George Albert Smith, the senior apostle, was called to the presidency of the church on May 21, 1945, by the Council of the Twelve Apostles. He chose as his counselors, J. Reuben Clark, Jr. and David O. McKay. The new president was born April 4, 1870, in Salt Lake City. He was called to the apostleship on Oct. 6, 1903, at the age of 33, and has served continuously since that time. His father, grandfather, and great grandfather have been general authorities of the church. President Smith is in temperament kind, generous, and understanding, a lover of mankind, a forceful speaker and defender of his faith. He has had large experience in a great variety of human relations; as a member of the national guard; national officer of the Sons of the American Revolution, and the Boy Scout movement (from which he has received the Silver Beaver and Buffalo awards); a chief promoter of the Pioneer Trails and Landmarks Association, which has built monuments to commemorate historic trails and events in the building of western United States. President Smith is well educated, a world traveler, and known to a host of men, the world over. All of these varied interests converge upon his work in behalf of the church. The people are grateful for his appointment.

Elder George F. Richards, who became the senior apostle upon President Smith's assumption of the presidency, became president of the Council of the Twelve Apostles on May 21, 1945. Elder Richards has served as an apostle since 1906.

On October 5, at the general October conference, Elder Matthew Cowley was called from his law practice to fill the vacancy in the Council of the Twelve. Elder Cowley had been a long time missionary for the church in New Zealand.

With the ending of the war, the historic tabernacle on Temple Square in Salt Lake City was again opened to the public. The October 1945 conference of the church (during the war years conferences were open only to a limited number of priesthood bearers) was the most largely attended conference of the church.

The eighth standing temple of the church, a beautiful building constructed at a cost of about \$1,000,000 in Idaho Falls, Idaho, was dedicated, with an attendance of nearly 24,000, on Sept. 23-25, 1945. Before the dedication, the temple was thrown open to the public and visited by tens of thousands of people.

JOHN A. WIDTSOE,
Church of Jesus Christ of Latter Day Saints, Salt Lake City, Utah.

MOROCCO. A sultanate of northwest Africa, bounded on the north by the Mediterranean, east by Algeria, south by the Sahara and Rio de Oro (Spanish Sahara), and northwest by the Atlantic. The sultanate has an area of 172,922 square miles, and a population of about 9,029,000. The sultan (Sidi Mohammed ben Youssef proclaimed Nov. 18, 1927) is nominally an absolute monarch; in practice, however, his authority is restricted to administration of native justice and responsibility for Moslem religious affairs. In other

respects, three different systems of government prevail, the country having been divided into a French Zone, a Spanish Zone, and an international Tangier Zone by a series of treaties beginning in 1912. Paramount power is exercised by the French, whose resident general controls the foreign relationships of the sultanate, the capital of which is at Rabat. The areas, populations and capitals of the three zones are as follows:

Zone	Area, sq. mi.	Population	Capital
French . . .	153,870	7,991,000 (1941)	Rabat (171,600)
Spanish . .	18,827	937,684 (1936)	Tetuan (49,535)
Tangier . .	225	100,000 (1941)	Tangier (47,000)
Total . .	172,922	9,028,684	

FRENCH ZONE

In international law, the French Zone of Morocco is a protectorate. While all legislation emanates nominally from the sultan, it is drafted by a French staff and promulgated by the resident general. The latter controls administrative services and is responsible for internal order and external defense. He is assisted by a Government Council, having French and native membership; French members comprise high officials, presidents of economic chambers, and 22 elected representatives; while the native members are nominated by the grand vizier, who exercises the functions of the sultan's prime minister. The resident general is responsible to the delegate general for North Africa (Gen. Georges Catroux became first incumbent of the office on Aug. 28, 1944).

The population of the French Zone at the 1941 (est.) census amounted to 7,991,000, comprising (1936) 5,874,888 native Moslems, 161,312 native Jews, 173,533 French, and 59,058 other whites; the majority of the Moslems are of the Sunnite sect. Casablanca (pop., 1941 est., 453,000), a seaport, is the largest city, and Rabat (171,600) is the capital; other cities include Meknes (109,500) and Oudjda (65,000).

Education.—Little has been done to educate native Moroccans, the majority of whom are illiterate. Koranic schools, and higher schools affiliated with mosques, provided a curriculum that was mainly religious in character; prior to the outbreak of the war, however, some 25,000 native boys and girls were being educated on modern French lines. White children also attended modern schools (about 42,000 pupils in 1939), standards being equal to those obtaining in France. Schools for native Jews were conducted jointly by the protectorate government and the Alliance Israelite.

Agriculture and Livestock.—The most important industry is agriculture, particularly the cultivation of cereals. Hard wheat is grown on a considerable scale on the western plateaus and plains, and soft wheat in the Maghreb, while barley is the principal crop in the southern parts of the country. Peas, beans, and other legumes are grown widely, and other crops include canary-seed, cummin, and linseed. Both natives and whites cultivate vineyards; the argan tree, unique to southwestern Morocco, yields an oil which supplements the relatively small output from Moroccan olive trees. The dates of Morocco are much inferior to those produced in neighboring Algeria; citrus fruits do well, however, particularly oranges, and other fruits include the almond, apricot, fig, and walnut. Nearly 60,000 metric tons

of citrus fruits were raised in the 1944-45 season, approximately 10,000 tons more than in the preceding year. Truck gardening, for export is carried on in the vicinity of Casablanca, Rabat, and Mazagan. During 1944, 13,057,429 sheep were raised in French Morocco, as compared with 12,870,472 in the preceding year, and about half that number of goats; there are also large numbers of cattle, hogs, horses, and camels.

Mining.—French Morocco ranks second among African producers of phosphates, the reserves amounting to about one billion tons. Approximately 1,500,000 metric tons of phosphate rock were mined in 1944. The country ranks third in cobalt production; large iron ore deposits (50-60 million tons) have been exploited to a limited extent, and the same condition exists with respect to coal beds. The total coal output for the first quarter of 1945 was estimated at 47,800 metric tons. Other minerals include manganese, molybdenum, silver, lead, zinc, nickel, antimony, and graphite. Bauxite deposits have been reported in the Atlas Mountains. Copper production is negligible. Petroleum is being extracted on a small scale at Souk el Arba, in the vicinity of Taza, in the Rif district. The limestone formations are utilized in the production of cement, and deposits of rock salt are also worked.

Industry.—Shipping difficulties during the war were an aid to several local industries, particularly the manufacture of clothing and boots and shoes. While the canning of fish declined, that of fruits and vegetables increased; and the dehydration of fruits and vegetables was introduced in 1942. Construction of cold storage depots was scheduled in 1945. Soap-making has been hampered by a lack of raw materials. Native industries include the manufacture of carpets and leather goods. In 1944 the output of electric power amounted to 214,000,000 kilowatt hours, as compared with 190,000,000 in 1943.

Finance.—Revenue was estimated for the French Zone for 1944 at 2,604,982,000 francs, and expenditure at 2,604,658,000 francs.

External Trade.—First place among exports is normally occupied by phosphates, and the second by wool. Exports of phosphate rock increased from 892,000 metric tons in 1943 to 1,371,300 metric tons in 1944. Salted and canned fish, such products of native handicraft as leather goods and slippers, and numerous minerals, are other exports of importance. Machinery and motor vehicles are imported, as well as petroleum products, textiles, and basic foods produced in Morocco in insufficient quantities.

Communications.—Government-owned railroads (1,150 miles) operate from Tangier to Fez, and thence to the Algerian frontier, with branch lines serving all important centers. Highways (4,842 miles) are generally in good condition for automobile traffic, and the country is well equipped with wire and wireless telegraphic and telephone facilities.

SPANISH ZONE

Spanish Morocco comprises two protectorates and other areas:

Territory	Area, sq. mi.	Population
Protectorate of the Southern Zone	10,039	5,000
Protectorate of the Northern Zone	7,970	795,000
Ifni ¹	741	903 ²
Settlements: Alhucemas, Ceuta, Chafarinas, Melilla, Penon de Velez	77	136,779
	18,827	937,684

¹ Administered from Cabo Yubi, capital of Rio de Oro (Spanish Sahara).

² White population only.

The powers of the sultan in Spanish Morocco are delegated to a khalifa (deputy), whose administrative acts are controlled by a Spanish high commissioner (Lieut. Gen. José Varela appointed March 4, 1945). Besides Tetuan, the capital (pop., 1936, 49,535), the principal towns are Alcazar (30,762), Larache (29,477), and Xauen (6,065). The government conducts a number of schools, including special institutions for natives where instruction is in both Moorish-Arabic and Spanish. Farming is left almost entirely to natives (unlike the case in French Morocco), and is in a backward condition; there are some 320,000 olive trees, and numerous livestock, but arable farming has made little headway. The country is rich in metalliferous ores, notably in deposits of magnetite and hematite iron ore in the Rif at Uixan, 12 miles south of Melilla, where there are reserves of 80 million tons; there are lesser reserves of antimony, lead, and manganese likewise mined on a limited scale. Besides minerals, skins, cork, vegetable fiber, cattle, and eggs are exported; the principal imports are textiles, automobiles, petroleum products, and foodstuffs. There is a fair highway system extending over 1,400 miles; and the territory is traversed for a distance of 72 miles by the railroad from Tangier to French Morocco.

TANGIER ZONE

By a statute which came into effect June 1, 1925, Tangier, permanently neutralized and demilitarized, became an international zone administered by Spain, France and Great Britain; by an agreement signed July 25, 1928, Italy adhered to the terms of the statute. In 1940, following the surrender of France, Spain abolished the international administration, despite protests on the part of Britain and the United States, native troops entering the city from Spanish Morocco on June 14; the Committee of Control and the Legislative Assembly were abolished on November 3; and on May 4, 1941, Spaniards took over the customs service. Meanwhile, on March 16, 1941, the mendoub, the sultan's representative in Tangier, was ejected by the Spaniards, who installed Khalifa Sidi Muley Hassan ben el Mehedi in his stead. Discussions by representatives of the United States, Great Britain and France to determine the postwar status of Tangier, scheduled to begin on July 3, 1945 were postponed when, on the eve of the conference, the Soviet Union asked to participate; and on August 10, delegates from all four nations began conferring. On September 5 it was reported that, as a result of the conference, the Spanish government had been ordered to evacuate Tangier, and that the Sovereignty of the Sultan of Morocco would be re-established over the zone. Normally, schools for white children are operated by both the French and Spanish authorities; natives attend Koranic elementary schools; and the Jewish community maintain separate schools for native Jews. Locally-produced foodstuffs are supplemented by imported produce for the relatively large population. The tangerine, a type of orange, was named for Tangier, through which port much of the fruit was formerly exported to Europe. Within the zone are fisheries and a number of preserving factories. There are some 65 miles of roads. Great Britain operates the only foreign (non-French or non-Spanish) postal service in Morocco; the head office is at Tangier, and a branch at Tetuan.

MORRISON, Herbert Stanley, British politician:

b. Brixton, London, Eng., Jan. 3, 1888. On July 27, 1945, Mr. Morrison was named lord president of the council and leader of the House of Commons, after labour's sweeping victory in Britain's first general election since 1935. One of the three Labourites in Winston Churchill's war Cabinet, he served as minister of supply from May 12-Oct. 6, 1940. He was then appointed home secretary and minister of home security, and in that capacity, organized Great Britain's civil defense system and her national fire service. In 1942, he was chosen a member of the war Cabinet. As head of the London County Council, of which he had been a member since 1922, he was responsible for the expert evacuation of London school children at the outbreak of the Second World War. Mr. Morrison entered British politics in 1913, first as a newspaperman, later as secretary of the London Labour Party (1915-40). He was Labour Party chairman, 1928-29, and minister of transport, 1929-31. He is author of *Socialisation and Transport* (1923), *How Greater London Is Governed* (1935), *Looking Ahead* (1943), *Prospects and Policies* (1944), *Science and Administration In Modern Government* (a collection of lectures, 1944).

MOTION PICTURES. In 1945, the year of cessation of hostilities in the Second World War, a year marked by changes and unrest in social and labor conditions, the production of motion pictures reflected the unsettled times. This was seen not so much in the subject matter of films themselves as in the circumstances surrounding production. Fewer films were made and released than during the war years. Studios gave as reasons for the postponement of many large-budget pictures: wartime shortages of materials and government restrictions. It became apparent, however, after August when most of the restrictions were lifted at the close of the war with Japan, that a more important cause for the delayed schedules was the labor dispute in connection with set construction. The argument, which was brewing for some time previously, came to the open in March when two A.F. of L. affiliates (Conference of Studio Unions and International Alliance of Theatrical Stage Employees) claimed jurisdiction over 77 set designers who were striking. By October, this affair, which had seemed only a minor tempest at first, grew to large proportions, involved most of the principal motion picture companies and some 7,000 film workers. Production on many films was slowed up and in a few studios was stopped entirely. Although most of the companies had a backlog of completed films ready for release, it was predicted that the results of this labor dispute, which was finally settled, would be felt well into 1946.

Few events of the year caused so much widespread uncertainty or disturbance in Hollywood as the labor difficulties, although other more important situations arose. A large number of actors and technicians who had served in the armed forces returned and resumed their former positions. Warner Brothers and United Artists, for reasons never publicized, resigned from The Motion Picture Producers and Distributors of America, Inc., better known as the Hays Office—a title which may soon pass out of use, for in September Will H. Hays, himself, resigned as its head. Mr. Hays had held this position as "czar" of the movie industry since 1922 when the office was founded by the motion picture companies. As his successor, Eric A. Johnston, president of the Chamber of Commerce of the United States,

was appointed. While it was not expected that Mr. Johnston would make radical changes in the much-discussed Production Code that lay down the ethical law for films, it was hoped he would enforce its rules with greater flexibility. Among the many problems, beside the strike and jurisdictional fight over the set designers, confronting Mr. Johnston when he assumed office were such major concerns as: the resumption of foreign trade after the war (from 30 to 40 per cent of the profits on each film usually came from abroad); the complaint from English producers, led by Arthur J. Rank, that English films did not get favorable distribution and playing dates in the United States; and the re-opening in October of the government's anti-trust suit against the major producing-distributing companies. This case, started in 1938 to divorce producer-distributors from their theater holdings, and to stop block booking and blind selling, resulted in 1940 in a consent decree which provided for the selling of pictures in groups of not more than five with the exhibitor having the right to see the films he bought. However, neither the government nor the independent theater owners were satisfied with the working of the decree during the past years. The defendant companies in the suit were Paramount, Loew's, Inc. (M-G-M), Warner Brothers, Twentieth Century-Fox, Radio-Keith-Orpheum Corp. (RKO), and United Artists, Universal and Columbia—the last three did not own theaters and were in a special group because they did not sign the original decree.

During most of 1945, money flowed as freely as in the war years, and the public was willing to pay well for motion picture entertainment. In majority of cases it was an unusually poor picture that did not show a profit; while the better pictures (most of which were made on larger budgets than ever before) ran for long playing engagements in the big houses. These prolonged engagements were due to the efforts of the industry to get all the returns possible out of each film since there were fewer releases, and to the eagerness of pleasure-seeking movie-goers.

It was no surprise that the popularity of comedies and escapist pictures increased while pictures with war themes were losing appeal. Even in 1944 Hollywood saw the beginning of the public's reaction against war films and the production of this type of movie fell into decline. There were notable exceptions: films that were started before the reaction set in and films based on popular books which could be expected to attract audiences. Best of these was Ernie Pyle's *The Story of G.I. Joe*, produced by Lester Cowan, directed by William A. Wellman, based on the famous correspondent's writings. While depicting details of the African and Italian campaigns, this realistic film portrayed the work and fighting of infantry soldiers and forcefully emphasized the tragic waste of war. Another outstanding example was *They Were Expendable*, expertly directed by Capt. John Ford, based on William L. White's book praising the work of P-T boats in the Pacific and their courageous crews.

As might be expected, because of timeliness, phases of the war against Japan were used as subject matter more often than the European front. *God Is My Co-Pilot* celebrated Gen. Chenault's fliers in China. *Back to Bataan* honored the Filipino and American guerrillas who fought so bravely against the Japanese. *Objective Burma*, realistically acted by an all-male cast, was about a group of Americans on a special mission

in a Jap-infested jungle. (The extraordinary thing about this movie, highly praised in the United States, was the storm of protest it received in England because it said nothing about the British campaign in Burma. So excited were the English about this unintentional neglect, that Warners set a precedent by withdrawing the film from London theaters.) *China Sky* was more concerned with a cheap love story than with our allies in the Pacific. *Blood on the Sun*, laid in Tokyo in 1928, told a tale steeped in intrigue and spying when Baron Tanaka was premier of Japan.

Naturally there were other spy-and-chase movies. *Ministry of Fear* failed to catch the subtle implications of Graham Greene's novel but provided thrills in its story about a Londoner tracking down spies. *Paris—Underground*, unfortunately for its producer, actress Constance Bennett, came out so late in the year that its plot about smuggling fliers out of Occupied France seemed outdated. After V-E and V-J days, the studios tried to make their espionage stories more timely through references to the atomic bomb or by giving them a now-it-can-be-told angle. *First Yank into Tokyo* ended with shots of bombs being dropped on Hiroshima and Nagasaki. The most successful of the spy films was *The House on 92nd Street*, which producer Louis de Rochemont gave the tone of a documentary film portraying the work of the F.B.I. in preventing sabotage.

It was in the real documentaries that one saw the best and most vivid sequences of the war. The five newsreel companies, which were supplied the same war footage by a common pool, varied their presentations through individual editing, sound tracks and commentaries. These newsreels, released twice a week, also covered post-war items and other national events and interests. The *March of Time* and *This Is America* series continued their two-reel semi-documentary reports on a wide variety of timely subjects. But it was the straight documentaries that won the acclaim of critics and public. Shorts like *To the Shores of Iwo Jima*, showing the marines in action, and *Orders from Tokyo*, showing the carnage and atrocities perpetrated by the Japanese in the Philippines, and longer films like *The Fighting Lady* (photographed under the direction of Capt. Edward Steichen, produced by Louis de Rochemont), showing life, work and death aboard an aircraft carrier, and *The Battle of San Pietro* (written and directed by Maj. John Huston), recording the infantry's bitter battle for an Italian town, were made by the government and released through the film companies' regular distributing channels. These strong, realistic documentary films kept reminding the public how much was owed to our armed forces. Perhaps the greatest film of this group, certainly the most widely publicized and praised was *The True Glory*, made by the Anglo-American Film Planning Committee under the supervision of American (Capt. Carson Kanin) and British (Carol Reed) directors. It reported the Allies' western invasion of Europe from D-day to the fall of Germany and stressed that the teamwork, so important in winning the war, must continue while victory was put to the test of peace. The first-rate visuals, taken mainly by combat cameramen, and the explanatory maps were accompanied by an excellent commentary which was made even more striking through being narrated by many individuals, thus giving the effect of participants making observations on the war. This device strengthened the teamwork and democracy themes.

Hollywood also made war-related films that looked behind combat scenes for fundamental drama with political and ideological themes. *Hotel Berlin*, strategically released in March, was a melodrama about confusion among the leaders and little people of Germany as the war drew to a close. *Counter-Attack* showed two Russians trapped with eight Germans in a cellar and dramatically contrasted the war purposes of these enemies. *Over 21*, a comedy about a newspaper editor at Officer Candidate School, included one-world propaganda in its story. The evils of nazism were forcefully presented in *Tomorrow, the World*, which showed a German boy trying to destroy the American family who adopted him. The advantages of democratic over Fascist government were repeatedly pointed out in *A Bell for Adano*. This popular film, derived from John Herscy's novel about an Italian town after the American Army took control, showed its hero failing as a soldier because of military red tape but succeeding as a man and democrat.

A subject that interested all Americans and in which Hollywood was well prepared was that of soldiers' return to civilian life. Even in 1944 Hollywood started this cycle, and in 1945 many versions were filmed. *Those Endearing Young Charms* distorted the moral issues with a silly love story. *You Came Along* was overly theatrical in its laughter-through-tears plot about a doomed hero and the girl who loved him. *The Clock*, with Judy Garland and Robert Walker, revealed a simple, charming tale about a soldier and the girl he met and married in New York. In *A Medal for Benny*, the title character never appeared, but his father had sharp things to say about Americans commercializing war heroes. *The Enchanted Cottage* sentimentally retold Pinero's story about the disfigured flier and the homely girl who through love became beautiful in each other's eyes. More realistic, but marred by the sensational past in the girl's life, was *I'll Be Seeing You*, which again portrayed the therapeutic potency of love—this time for a psychoneurotic soldier and a girl on furlough from prison. Best of 1945's returning-soldier films (although at the year's end many were still in preparation) was *Pride of the Marines* which told with documentary-like realism the true story of Al Schmid, who was awarded the Navy Cross for heroism at Guadalcanal where he lost his eyesight. This was not so much a combat movie as it was a picture of homecoming and rehabilitation for the embittered blind man exceedingly well portrayed by John Garfield. This fine biographical film, with moving scenes like the one in which wounded men discuss their future, their fears of facing life and the apathetic home front, was highly praised for confronting issues honestly and bravely.

Hollywood frequently turned to biography in 1945, no doubt because in telling stories of colorful figures from the past, the movies could avoid reference to the troubled present. *Captain Eddie* was an exception, but even in this life of Rickenbacker, most footage was devoted to his youth; the famous flier's labor pronouncements were not mentioned. *Dillinger*, a powerful and popular picture about the infamous man, created a controversy as to whether Hollywood was starting a new cycle of gangster films, a subject looked upon with apprehension by those concerned with post-war delinquency. However, most of the biographical pictures side-stepped controversial issues. *Captain Kidd*, with Charles Laughton,

satirized the pirate. *A Royal Scandal*, with Tallulah Bankhead, laughed at a romantic incident in the life of Catherine the Great. *The Great John L.* told the story of the hard-drinking, hard-fighting Sullivan. Notable for their excellent musical scores were *A Song to Remember*, which distorted the Chopin-Sand affair, and *Rhapsody in Blue*, which vividly visualized and interpreted incidents in the life of George Gershwin. *Incendiary Blonde*, with Betty Hutton portraying Texas Guinan, and *The Dolly Sisters* were really musical comedies that decorated their semi-biographical plots with songs of the period and glittering Technicolor.

As in other recent years, 1945 saw many musical comedies. Some celebrated well-known places of entertainment: *Diamond Horseshoe* and *The Stork Club*; some pictured backstage life; *George White's Scandals* and *Tonight and Every Night*. *Yolanda and the Thief*, starring Fred Astaire, was a pleasant adult fantasy. Several of the musicals put their stars in uniform: *Here Come the Waves* and *Anchors Aweigh*. The latter, a brilliant comedy with Frank Sinatra and Gene Kelly, was tremendously popular; in one of its most charming sequences Mr. Kelly danced with animated cartoon figures. This device was also used by Walt Disney in his feature-length picture, *The Three Caballeros*; while the Disney film was praised for its spectacular effects and technical innovations, it was also criticized for lack of good taste.

Some of the most popular romances used musical scenes as added attractions to glamorous stories: *Thrill of a Romance*, *Music for Millions*, *Week-End at the Waldorf*. The latter had a large star-studded cast including Ginger Rogers, Walter Pidgeon, Lana Turner, Van Johnson. Some of the romantic comedies came to the screen without benefit of added musical sequences: *Men in Her Diary*, *Her Highness and the Bellboy*, *Guest Wife*, *The Affairs of Susan*, *Christmas in Connecticut*. Many of the year's most hilarious comedies used not only musical scenes but also stories that were specially written to suit the personalities of their players: *It's in the Bag* (with Fred Allen), *Here Come the Co-eds* (Abbott and Costello), *The Horn Blows at Midnight* (Jack Benny), *Duffy's Tavern* (Ed Gardner as Archie), *Wonder Man* (Danny Kaye). There was a tendency in this last group of films, and in others like *Where Do We Go from Here?*, *Along Came Jones*, *Out of This World*, to parody other movies, well-known stars and cinematic clichés. Hollywood's burlesquing itself provided an indication of good health and approaching maturity. None of these comedies and romances was likely to make movie history, but one of them, *Brewster's Millions*, would certainly be mentioned in footnotes on race prejudice. The film itself was no work of art, but it created comment when it was banned in Memphis because one of its characters was a Negro who, according to that city's censor board, "has too familiar a way about him and the picture presents too much social equality."

That statement, made in the enlightened year of 1945, would be excuse enough for business-minded film producers to concentrate on profitable escapist pictures. Costume melodramas were expensive to make, but they won audiences and showed their value at the box office if no where else. *Sudan*, *The Fighting Guardsman*, *Salome—Where She Danced*, *Nob Hill*, *Kitty*, *A Thousand and One Nights*, *The Spanish Main* were examples. Most of these and many of the musical comedies and romances were in Technicolor

which enhanced their beauty and increased their already high expenses 25 per cent. A total of 35 feature films were produced in Technicolor during the year; and a larger number of shorts, including travelogues and animated cartoons, were made in this process. (Most of the year's output of shorts, totaling well above 400, were without color and covered the usual trite subjects. Unusual material was found in the war shorts, the semi-documentaries and such planned propaganda pieces as *The House I Live In*, in which the teen-agers' favorite, Frank Sinatra, made an effective plea for racial and religious tolerance.)

Animal movies in color like *Thunderhead, Son of Flicka* and *Son of Lassie* continued to prove popular. *The Enchanted Forest* included wild animals in its simple, moving story about nature's power in curing psychological ills. While there were a large number of minor "westerns" (Roy Rogers was still King of the Cowboys), there were few big productions released with "horse opera" themes. There was indicated, however, the beginning of a farm cycle with *The Southerner, Our Vines Have Tender Grapes* and *State Fair*, the first two being realistic, the latter being a likeable comedy with gay music by Richard Rodgers and Oscar Hammerstein II.

These pictures of farm life would no doubt provide useful subjects for the Office of War Information (OWI) and army psychological warfare bureaus; for, while many of the government war-related departments disbanded after August and government film production was cut down, these agencies continued to function. One of their jobs was the taking over of theaters in former enemy-occupied countries, particularly Germany and Japan, to inform the people through factual and entertainment films about the American way of living and about various phases of the war.

Americans also had opportunity to become informed through foreign films. There were importations from Mexico, Sweden, France, but the largest number came from England and Russia. From Switzerland came two brilliant anti-war films: *The Last Chance* and *Marie Louise*. English producers doubtlessly had some right to complain about the scant distribution their films got in the United States. The distributors answered that English films lacked favor here because of their slow pace and unfamiliar stars, but it became obvious as the discussions went on that English movies would get better treatment in this country. Imports that compared favorably with Hollywood products included such war films as: *The Way Ahead, Mr. Emmanuel, The Silver Fleet, Colonel Blimp* and such sophisticated comedies as *On Approval* and *Blithe Spirit*. Movies from Russia, while technically good, were labored with propaganda. *Girl No. 217, The Last Hill, Zoya, Moscow Skies* were among those which appealed to special audiences. *The Fall of Berlin*, an excellent documentary with commentary in English, won great attention and increased American respect for the victorious Soviet armies.

But few foreign films seriously competed with Hollywood movies, most of which attracted audiences through their stars. (In the United States the five top favorite women and men listed alphabetically were: Ingrid Bergman, Bette Davis, Judy Garland, Greer Garson, and Betty Grable; Gary Cooper, Bing Crosby, Cary Grant, Bob Hope and Spencer Tracy.) Producer-director Leo McCarey, whose *Going My Way* won the Oscar for the best film of 1944, followed that picture with a sequel. *The Bells of St. Mary's*, which

starred two Oscar winners (Bing Crosby and Ingrid Bergman) and captivated audiences with its appealing story about a priest and a nun. Screen adaptations from plays like *Guest in the House, The Corn Is Green, Without Love, Junior Miss, Kiss and Tell* became even more popular as movies than they had been on the stage. One trend, well established in 1944, grew to great importance in 1945 and saw no signs of diminishing. This was the cycle of mystery, psychological-horror and crime-and-detection films made as expensive A productions by leading directors and with outstanding stars. Among the most popular of the many examples were: *The Suspect, Hangover Square, Murder, My Sweet, And Then There Were None, Uncle Harry, Love Letters, Lady on a Train, Spellbound*. Many of these were based on plays and books, and the best of the lot were given added cinema values.

Other successful movies were based on popular novels like *The Valley of Decision* and *Mildred Pierce*. Oscar Wilde's moral fantasy, *The Picture of Dorian Gray*, was made into an artistic, sincere portrait of culture and corruption. Also adapted from novels were two of the year's best films, pictures which used cinema advantageously to portray life and represented Hollywood's highest standards in establishing movies as an art form. *A Tree Grows in Brooklyn*, produced by Louis D. Lighton, beautifully directed by Elia Kazan, acted by a fine cast, succeeded in capturing the glowing essence of hope that pervaded Betty Smith's book; for nostalgic audiences the film effectively visualized family relationships and childhood spent in city streets of several decades ago. *The Lost Weekend*, produced by Charles Brackett, directed by Billy Wilder, written by these two men from Charles R. Jackson's novel about an alcoholic, presented vividly and honestly the problems of a person seeking escape from life through drinking; the splendid cast led by Ray Milland gave memorable performances; and the picture won praise and expressions of gratitude for its straightforwardness in portraying its unfortunate hero as a person in ill health rather than a clown or criminal.

The Lost Weekend was voted best picture of the year by the New York Film Critics, it was announced on Jan. 1, 1946. Mr. Milland's work in this film won him first choice as the year's best actor, and Mr. Wilder's direction of this same picture was adjudged the year's finest directorial achievement. Ingrid Bergman was cited as the year's best actress by the critics for her work in RKO's *The Bells of St. Mary's* and in Alfred Hitchcock's *Spellbound*. Special awards were voted "to General Dwight D. Eisenhower and the motion picture units of the British and United States armies for the factual war film, *The True Glory*," and "to the United States Navy and Twentieth Century-Fox for the factual war film *The Fighting Lady*."

On Jan. 14, 1946, it was announced that 400 newspapers, magazines, wire services, and syndicates throughout the country, plus the film commentators of 81 radio stations, had voted Darryl V. Zanuck's *Wilson* the best picture of 1945. This poll, conducted by the magazine *The Film Daily*, cited *A Tree Grows in Brooklyn* and *Keys of the Kingdom* as second and third choices, respectively, in a list of the year's ten best pictures.

MOUNTBATTEN, LORD Louis (Francis Albert Victor Nicholas), British naval officer: b. Frogmore House, Windsor, England, June 25, 1900. Lord Mountbatten was Allied commander in chief in Southeast Asia for the war against Japan. He was selected for that post at the first Roosevelt-Churchill meeting in Quebec in August 1943. The following month, he was promoted full admiral. In April 1944, he directed the Allied counteroffensive against the Japanese in India and Ceylon. He met with Generalissimo Chiang Kai-shek in March 1945 for a strategy conference. On May 4, he announced the end of the Burma campaign, and revealed its cost to the Japanese—347,000 casualties, 97,000 counted dead. He went to Manila in mid-July 1945 to confer with General MacArthur, and a few days later, met with Anglo-American-Soviet leaders in Berlin. He accepted the formal surrender on September 12 of all Japan's southern armies, including 85,000 troops in the Singapore area, and 500,000 soldiers and sailors in southeastern Asia and the East Indies.

MURDOCK, Victor, American newspaper editor and politician: b. Burlingame, Kans., March 18, 1871; d. Wichita, Kans., July 8, 1945. Editor in chief of the Wichita *Daily Eagle* since 1924. Victor Murdock was a member of the federal House of Representatives from 1903 to 1915. His brilliant editorials, both before he entered politics and after his public career began, helped make the *Daily Eagle* a newspaper of much influence.

Educated at public schools and at Lewis Academy in Wichita, Murdock worked for a time as a political reporter for a Chicago newspaper. When he was 23 years of age he became managing editor of the Wichita *Daily Eagle*, a position he held until 1903, when he was elected to Congress to fill a vacancy. Angered over the arbitrary rejection of his bill to save the government huge sums on railway mail contracts, Murdock in 1907 launched a three-year fight to restrict the powers which Speaker Joseph Cannon exercised over the House. He won the bitter battle at the expense of his railway mail provision, which was knocked out of the bill to which it had been attached as a rider. In 1912 he left the Republican Party for the Progressive or "Bull Moose" wing, and was elected to the House as a Progressive Republican that year. From 1917 to 1924 he served as a member of the Federal Trade Commission.

MUSCAT AND OMAN. See ARABIA.

MUSEUM OF NATURAL HISTORY, American. See AMERICAN MUSEUM OF NATURAL HISTORY.

MUSEUM OF THE AMERICAN INDIAN, HEYE FOUNDATION. Commencing early in the year, the museum gradually returned to its exhibit cases the several thousand unique and more valuable specimens which had been removed and stored in 1942. These reinstallations proceeded until all the pieces were again on display.

During June, July and August, field work was carried on at two adjacent sites in Hampden County, Massachusetts. Earlier excavations there (1937) produced several Indian burials. During 1945 a considerable amount of aboriginal pottery was found. This is now being classified for study purposes.

A catalogue of some of the museum's more important carved and inlaid bone, and stone artifacts

from Southern California was published and distributed. A similar illustrated catalogue covering collections from Spiro Mound, Le Flore County, Oklahoma, was in preparation.

Museum of the American Indian, New York, N.Y.

MUSIC. The liberation of Europe was followed almost immediately by a revival of music activity. While the Germans were still launching buzz-bombs from Belgian soil, the opera house and the Philharmonic Orchestra of Brussels were giving opera and concerts, respectively. As soon as Holland was freed, the Concertgebouw Orchestra of Amsterdam received official permission to resume its activities. Its personnel was purged of collaborationists, and according to the Netherlands Information Bureau of New York, Willem Mengelberg, the internationally famous conductor of the orchestra in former years, was barred forever from conducting in Holland, by a ruling of the Dutch Honor Council for Music. In Milan the people started immediately to repair their historic opera house, La Scala. They had refused to do so during the reign of the Fascists and Nazis, even though the building was damaged by bombs in the spring of 1943. Arturo Toscanini has consented to return to Milan to conduct a number of performances at La Scala. The Salzburg festival, which had been discontinued since 1939, was resumed August 12. Five orchestral concerts were given by an organization called the Salzburg Philharmonic, conducted by Franz Prochaska, and there were six "Serenades" in the Reitschule and six performances of Mozart's opera, *Die Entführung aus dem Serail* in the Municipal Theater. Two American soldiers were among the conductors at Salzburg. In England music activity had increased during the war years, and as a result of the movement to decentralize the music life of the nation by encouraging major symphonies to travel, four British orchestras are now sponsored by the state—the London Symphony, London Philharmonic, Liverpool Philharmonic, and the Hallé Orchestra.

Many music shrines were injured by bombs. In Bayreuth, the home of Richard Wagner, the Villa Wahnfried, was almost demolished. The Festival Theater, however, was virtually untouched. In Bonn, the birthplace of Beethoven was surrounded by devastation. The house itself was badly damaged, but not destroyed, while the monument to Beethoven escaped injury altogether.

Orchestras.—The major symphony orchestras of the country enjoyed full seasons and almost capacity attendance. Among the older organizations, the Philharmonic-Symphony Society of New York opened its 103d season early in the fall of 1944; the Boston Symphony its 64th; Chicago its 54th; Cincinnati its 50th (Golden Jubilee); Philadelphia its 45th; Seattle its 41st; and Cleveland its 27th. The Detroit Symphony Orchestra had a special reason for celebration when it opened its 30th season October 12. It had survived a crumbling financial structure and had benefited from a reorganization which put it back into the ranks of leading orchestras. In 1941-42 the aftermath of Pearl Harbor had so disrupted the personnel and the backing of the orchestra that it was forced to cancel its 1942-43 season, except for a commercially sponsored series of Sunday radio concerts. Fortunately, this series held together enough of the orchestra to enable a newly-formed group, the Detroit Orchestra, Inc., to create a stable financial foundation. In

August 1943, an industrial chemist of Detroit, Henry H. Reichold, became president of the board of trustees and personally underwrote the 1943-44 season. Karl Krueger was brought from Kansas City as conductor, and 18 concerts were given. The 1944-45 season was longer, 20 pairs of subscription concerts and 16 children's concerts, and in addition there was a series of 20 half-hour broadcasts sponsored by Reichold. This philanthropist believes that a symphony orchestra can be put on a paying basis if it is merchandised in the same manner that commercial products are exploited. Many Detroit firms have bought advertising space in the orchestra's program books, and a number of them purchase blocks of tickets for free distribution among their employees.

Losses of men to the armed services left many places to be filled in the ranks of the leading orchestras. The Indianapolis Symphony (Fabien Sevitzky, conductor) opened its 1944-45 season with 50 per cent of its personnel new, and the combined reports of 18 major orchestras showed that 385 of their former members were in the military service. Of the 1,513 musicians employed by the orchestras during the 1944-45 season, 210 were women.

Several orchestras announced reappointment of conductors at the close of the 1944-45 season. Reginald Stewart was engaged for another year as conductor of the Baltimore Symphony, and Eugene Ormandy's contract with the Philadelphia Orchestra was extended to 1951.

At the annual meeting of symphony orchestra managers in Philadelphia, (May 1945), Harl McDonald, manager of the Philadelphia Orchestra, presented a composite financial report of 18 major orchestras. The gross operating expenses of the 18 orchestras totaled \$5,558,589, and the gross earned income \$3,827,639. The resulting combined deficit of \$1,730,950 was offset by gifts from philanthropists and friends of the orchestras totaling \$1,758,502, yielding a combined surplus of \$27,552. Some orchestras fared better from these gifts than others: twelve showed a combined surplus of \$84,576, and five were left with a combined, unfinanced, deficit of \$57,024. One had neither a surplus nor a deficit. Five of the orchestras enjoyed state or municipal grants.

The combined orchestras played a total of 1,479 concerts during the 1944-45 season, exclusive of broadcasts, to a total attendance of 3,473,628 persons. Six of the orchestras broadcast for commercial sponsors, and nine were paid a fee for sustaining broadcasts. Analysis of expenses showed that 70.8 per cent of the orchestras' expenditures was for conductors', musicians' and soloists' salaries and fees; 18.9 per cent for other direct concert expenses, and 10.3 per cent for administrative costs.

Opera.—New York's Metropolitan Opera House opened its 1944-45 season with a performance of *Faust*, November 27. From then until spring, the company gave 125 performances in New York and 48 on tour. The repertoire included 29 operas, of which the most performed were *Aida* (nine times in New York and three on tour), *La Bohème* (seven in New York, three on tour), *Lucia* (five in New York, five on tour), and *Don Giovanni* (five in New York, four on tour). *Carmen* was presented six times in New York, but only once out of town. The most important revival of the season was that of Wagner's *Die Meistersinger*, January 12, which won praise from the critics and the patronage of the public, not only for the distinguished perform-

ance of a cast headed by Charles Kullman, Eleanor Steber, and Herbert Janssen, but also for the superb conducting of George Szell and the colorful staging of Herbert Graf. *Die Meistersinger* had not been given at the Metropolitan for five years, and during the 1944-45 season it received four performances in New York, and four on tour. Other revivals were *La Gioconda*, January 25, after an absence of five years; Rimsky-Korsakov's *Le Coq d'Or*, March 1, after two years; and Beethoven's *Fidelio*, March 17, presented in English by a cast composed almost entirely of young Americans—Regina Resnik, Arthur Carron, Frances Greer, and others.

For the first time since the Metropolitan Opera Association bought the Opera House from the Metropolitan Real Estate Company in 1940, the season's operations showed a profit. This was made possible in part by reduction of real estate taxes, effected during the previous year by action of the New York State Legislature. The total receipts for the 1944-45 season were \$2,263,680.46, of which \$1,391,030 came from New York performances; \$520,624 from out-of-town performances; \$159,443 from broadcasting, and the rest from rentals, concessions, and contributions. Of the contributions, \$10,000 was donated by the Northern Ohio Opera Association, Inc. The expenses, with more than a million dollars paid to artists, musicians, and conductors, totaled \$2,117,674.91. With \$140,132.96 additional written off for taxes, interest and depreciation, the association was left with a net operating gain of \$5,872.59.

Subscriptions have been increasing over the past three years. In the 1942-43 season 45 per cent of the seats were filled by subscribers; in 1943-44, 48 per cent, and in 1944-45, 55 per cent. It was in 1942 that the top prices were reduced from \$7.00 to \$5.50, plus federal tax. As a result, the actual revenue has increased from 74 per cent of actual capacity in 1941-42, to 95 per cent in 1944-45. Two cities were added to the annual spring tour in 1945—Lafayette, Ind., and Minneapolis, Minn. Baltimore was restored to the list of cities visited, after an absence of two years, and the season in Boston was increased from eight to twelve performances. As usual, five special matinees were given for the school children of New York and surrounding communities.

In March, the Metropolitan Opera Guild celebrated its tenth birthday by presenting \$10,000 to the association, to be used for new productions. The former Metropolitan Auditions of the Air were re-entitled "The Metropolitan Opera Presents" and the winners were announced in April. Robert Merrill, baritone of Brooklyn, N.Y., and Thomas Tibbett Hayward, tenor of Kansas City, received checks of \$1,000, and contracts for the following season. Joseph Victor Laderoute, tenor, of Sault Ste. Marie, Ontario, and Pierrette Alarie, soprano, of Montreal, were given \$500 scholarships, and granted the Metropolitan an option on their services.

The 1944-45 season completed Edward Johnson's tenth year as general manager of the Metropolitan Opera Association. The membership of the association voted unanimously to extend his contract for another two years.

After five years' lapse the Chicago Opera Company presented a five-week season at the Civic Opera House beginning Oct. 16, 1944. *Carmen* was performed on the opening night with Gladys Swarthout and Kurt Baum heading the cast. The repertoire included *La Traviata*,

with Bidu Sayao and Nino Martini; *La Bohème*, with Marjorie Hess, Martini, and Richard Bonelli; *Aida*, with Zinka Milanov and Kerstin Thorborg; *Die Walküre*, with Helen Traubel and Astrid Varnay; *Romeo and Juliet*, with Jeanette MacDonald and Michael Bartlett; *Pelléas and Mélisande*, with Bidu Sayao and Martial Singher; *Faust*, with Vivian della Chiesa; Raoul Jobin, and Ezio Pinza; *Rigoletto*, with Leonard Warren, Josephine Antoine, and Jan Peerce; *Il Trovatore*, with Zinka Milanov, Kerstin Thorborg, and Richard Bonelli; and *Otello* with Rose Bampton.

San Francisco enjoyed its 22d opera season, starting Sept. 29, 1944, with *Aida*. The highlight of the season was the production of *Salome* with Lily Djanel in the title role. The singers for all the operas included Lily Pons, Risé Stevens, Lily Djanel, Leonard Warren, Charles Kullman, Jan Peerce, and Vivian della Chiesa. In March, the San Francisco Opera Association announced that its 1945-46 season would open September 25 in the War Memorial Opera House, and would be extended to five weeks.

Summer Music.—The Berkshire Music Center at Tanglewood, near Lenox, Mass., was the scene of a Bach-Mozart Festival, opening July 28. Serge Koussevitzky conducted a chamber-orchestra of players from the Boston Symphony, and the soloists were Alexander Brailowsky, Abram Chasins, and Constance Keene, pianists. Virtually all of the seats for the festival were sold, mostly to people from neighboring communities. Gasoline restrictions and difficulties of railroad travel allowed few persons other than representatives of newspapers to make special trips to Tanglewood.

Bad weather during July forced many postponements of the scheduled opera and ballet performances at the Lewisohn Stadium in New York, but every announced performance was given, even though delayed. The season opened June 18 and continued for eight weeks. Conductors were Artur Rodzinski, Alexander Smalens, Leonard Bernstein, Eugene Goossens, Fabien Sevitzky, Ignace Strasfogel, and Andre Kostelanetz, who led a special concert featuring Lily Pons, June 28. Instrumental soloists included Josef Hofmann, Alexander Brailowsky, Oscar Levant, Aleo Templeton, and Ania Dorfman, pianists; duo-pianists Lubeschutz and Nemenoff; and Erica Morini, Nathan Milstein, and Bronislaw Huberman, violinists. The Platoff Don Cosack Chorus sang June 23; James Melton, June 21; and other features included a Sigmund Romberg concert directed by the composer; an all-Gershwin concert; Beethoven's Ninth Symphony with the Schola Cantorum; and a complete performance of *Carmen*, with Gladys Swarthout in the title role. The scheduled production of this work (July 9) was interrupted at the close of the first act by rain, but complete performances were given July 11 and 13.

The 60th season of the Boston Symphony "Pops" concerts ran from May until July 17. The Hollywood Bowl offered 35 concerts in its 24th season, 16 of them conducted by Leopold Stokowski. Washington enjoyed its Watergate concerts played by the National Symphony Orchestra. St. Louis had its municipal summer opera, with a repertoire which included *The New Moon*, *The Cat and the Fiddle*, *Madame Pompadour*, and other favorite light operas. The annual summer concerts were given in Chicago's Grant Park; Cincinnati had its 24th consecutive season of summer grand opera in the pavilion of the

Zoological Society, offering 36 performances with Metropolitan stars; Philadelphia's Robin Hood Dell concerts were given from June 20 to August 3, with a record of postponements because of rain (12 out of 28 concerts); New Orleans had its third series of "Pop" concerts, starting June 7, this year in Beauregard Square; and summer concerts in San Francisco were resumed in the Civic Auditorium after a lapse of ten years. The Chautauqua Institution at Chautauqua, New York, opened its 72d summer program July 1. Musical features included the concerts of the Chautauqua Symphony under Franco Auri, six performances of the opera company conducted by Alfredo Valenti, and numerous recitals by soloists.

Radio Music.—A sampling of musical favorites on the radio was gained by the second annual polls conducted by *Musical America*, and announced in May and July 1945 issues of that journal. One of the polls was conducted among the 500 music editors of the country, and the other among the general public. The professional critics and the public showed a surprising similarity of taste. Both voted that the four days of music in tribute to Franklin D. Roosevelt was the outstanding musical event of the year. Both considered *Die Meistersinger* the best performance of any rendered by the Metropolitan Opera Company; the Philharmonic-Symphony of New York was voted the best symphony orchestra by each group; Arturo Toscanini, Serge Koussevitzky, and Artur Rodzinski were named by both as the best symphony conductors; and Bruno Walter, George Szell, and Erich Leinsdorf, as the best opera conductors, in the order listed. The *Telephone Hour* was voted by both to be the best orchestral program with featured soloists; the *Texaco Star Theater* the best musical variety show; the Stradivari Orchestra the best small ensemble; Alec Templeton the best instrumentalist regularly featured; and Milton Cross and Ben Grauer were awarded first and second place, respectively, as leading announcer-commentators.

Festivals.—The annual Worcester (Massachusetts) Festival was resumed Oct. 9-14, 1944, after a year's interruption caused by the death of the former conductor, Albert Stoessel, and by war conditions. Walter Howe is the new festival director, and the chorus was supplemented by the Philadelphia Orchestra under Eugene Ormandy, and by noted soloists. Columbia University presented in New York its first annual Festival of Contemporary American Music, sponsored by the Alice M. Ditson Fund, May 12-14, 1945. At this festival Howard Hanson conducted an orchestral concert played by the NBC Symphony, the Walden String Quartet gave a chamber-music concert, and a new opera by Normand Lockwood, based on Percy MacKaye's play, *The Scarecrow*, was performed under the direction of Otto Luening. The Eastman School Festival of American Music was given for the 20th consecutive season at Rochester, New York, April 24-28. The programs presented new works and others which had been heard at previous American Composers' Concerts in Rochester. The annual Bach Festival at Bethlehem, Pa., May 18-19, was conducted by Ifor Jones, and offered the *St. John Passion*, the Mass in B Minor, and the *Musikalisches Opfer*. The tenth Coolidge Festival at the Library of Congress in Washington Oct. 28-30, 1944, commemorated the 80th birthday of Mrs. Elizabeth Sprague Coolidge, founder and sponsor of the festival. One of its features was Aaron Copland's ballet, *Appalachian Spring*,

which was commissioned by Mrs. Coolidge. The 52d annual May Festival at Ann Arbor, Mich. (May 3-6), enlisted the services of the Philadelphia Orchestra, the University Choral Society, and a number of soloists, including Ezio Pinza, Eleanor Steber, Frederick Jagel, and Oscar Levant.

Composers.—Film-actor Lionel Barrymore joined the ranks of American composers when his *Praeludium and Fugue* was given its world premiere by the Indianapolis Orchestra Oct. 28, 1944. The \$500 Pulitzer Prize for music was awarded May 7 to Aaron Copland for his ballet, *Appalachian Spring*. The work had originally been written for the dancer, Martha Graham, on commission from Mrs. Elizabeth Sprague Coolidge. William Schuman, American composer, was appointed president of the Juilliard School of Music, to succeed Ernest Hutcheson, who resigned in March. Schuman had been teaching since 1935 at Sarah Lawrence College, and assumed his new duties October 1. Walter Piston was awarded the annual testimonial of the Music Critics' Circle of New York for his Second Symphony adjudged the best orchestral work by an American composer heard in New York during the 1944-45 season. The circle's award for dramatic music was given to Aaron Copland for *Appalachian Spring*.

Necrology.—Edgar Stillman Kelley, the dean of American symphonic composers, died in New York, Nov. 12, 1944, at the age of 87. Kelley was born in Sparta, Wis., in 1857, and had a long list of major works. His incidental music for the stage production of Lew Wallace's *Ben Hur* is said to have had over 5,000 performances in English-speaking countries. In 1937 the Edgar Stillman Kelley Society was founded in New York for the purpose of publishing reasonably-priced scores of works of young American composers. Mrs. Kelley, who survives her husband, has long been active in the National Federation of Music Clubs, of which she was at one time president.

Karl Flesch, violinist, and at one time head of the violin department of the Curtis Institute of Music in Philadelphia, died in Lausanne, Switzerland, Nov. 15, 1944, at the age of 71. He was a native of Moson, Hungary, and was famous as a concert violinist. He was associated with the Curtis Institute from its founding in 1924 until 1928 and then went to Berlin as a faculty member of the Academy of Music. Later the Nazi regime forced him to leave the country and he settled in Switzerland.

Nelle Richmond Eberhart, librettist and author of song lyrics, died in Kansas City, Nov. 15, 1944. She was born in Detroit and was a school teacher in Nebraska until her marriage in 1894 to Dr. Oscar Eberhart. Her best known texts were those set to music by Charles Wakefield Cadman; the operas, *Shanewis*, and *The Garden of Mystery*, and the songs, *From the Land of the Sky Blue Water* and *At Dawning*.

Josef Lhevinne, concert pianist and teacher, died at his home in Kew Gardens, Long Island, N.Y., Dec. 2, 1944, twelve days before his 70th birthday. Lhevinne was born in Moscow. He achieved a world-wide reputation, and made his home permanently in this country after the First World War. For a number of years both he and his wife, Rosina Lhevinne (also a pianist), were prominent faculty members of the Juilliard School of Music.

Mrs. H. H. A. Beach, leading American woman-composer, died in New York, Dec. 27,

1944, at the age of 77. Born Amy Cheney, in Henniker, N.H. (1867), she made her formal debut as a pianist in 1883, and in the following year appeared as soloist with the Boston Symphony under Theodore Thomas. In 1885 she married Dr. Henry Aubrey Beach of Boston, and until his death in 1910 she made few appearances in public. From 1910 to 1914 she lived in Europe, playing concerts in the continental music centers. Her works include major pieces for orchestra, for chorus, and many songs, of which the best known are the Browning settings: *The Year's at the Spring* and *Ah, Lovel! But a Day*.

Judson House, opera and concert tenor, died suddenly at his home in Dumont, N.J., Jan. 5, 1945. He was 50 years old.

Kenneth Clark, at one time secretary of the National Music Week Committee, died at Princeton, N.J., January 22, at the age of 62. During the First World War he was an entertainment secretary with the Y.M.C.A. and served overseas. For the 1940 presidential campaign he composed *The Willkie March*.

Harold Sanford, from 1906 to 1924 assistant conductor and orchestra manager for Victor Herbert, died at Springfield, Mass., January 19, at the age of 65. For 14 years, until his retirement in 1940, he had been an orchestral conductor for the National Broadcasting Company.

Hamilton Crawford MacDougall, organist and composer, and for 27 years a member of the music faculty at Wellesley College, died at Wellesley, Mass., March 16. MacDougall was 86 years old, and was one of the founders of the American Guild of Organists.

Edwin Evans, English music critic and musicologist, died in London, March 3, at the age of 70. Before he commenced writing on musical subjects, in 1901, Evans had been identified with submarine cables, stock brokerage and banking.

Oscar Thompson, music critic of the New York Sun and former editor of *Musical America*, died at the age of 57 in New York, July 2. In addition to his work as editor and music critic, Thompson was the author of numerous books on music and the compiler of the *International Cyclopedia of Music and Musicians*.

Erno Rapee, orchestra conductor, died in New York, June 26, at the age of 54. He was born in Budapest in 1891, and came to New York in 1912. In 1917 he became conductor of the orchestra at the Rialto Theater in New York, and thereupon became identified with music in motion picture houses. His most prominent associations were with the Roxy Theater, and the Radio City Music Hall, where he was music director from 1932 until his death.

Nicolas Tcherepnin, Russian composer, died in Paris at the age of 72, according to news received in New York, June 29. He was the composer of three operas, and numerous ballets.

Pietro Mascagni, Italian composer of the opera, *Cavalleria Rusticana*, died in Rome, August 2, at the age of 81. Although Mascagni composed many operas, none achieved the vogue of his masterpiece. (See LATIN AMERICAN MUSIC.)

JOHN TASKER HOWARD,
Musician, Composer and Author.

MUSSOLINI, Benito, Italian dictator: b. Dovia, province of Forlì, Italy, July 29, 1883; d. near Como, Italy, April 28, 1945. Founder of fascism and for over 20 years, ruler of Italy in all but name, Benito Mussolini was the first of the 20th century's dictators to achieve power, and the

first to lose it. He was educated in the elementary schools and at Switzerland's University of Lausanne. An ardent Socialist at the beginning of his political career, in 1912 he became editor of the Socialist Party's daily *Avanti*. He resigned as *Avanti's* editor in 1914 to publish his own paper, *Il Popolo d'Italia*, in which he campaigned for Italian intervention in the First World War on the side of the Allies. After Italy entered the war, he volunteered for military service, spent two years in the army, and in February 1917, was discharged after having been severely wounded. In March 1919, he founded the Fascist movement, popularizing it through his support of D'Annunzio's occupation of Fiume. He obtained financial support from Italy's industrialists with his claim of having saved the nation from bolshevism. Thousands hastened to join the movement, and in 1921, he organized fascism as a political party, imposing the strictest discipline upon party members and supervising the spread of fascism throughout Italy. He then turned his attention to the government; assailed it as weak and vacillating; and in October 1922, ordered the Fascist march on Rome. After token resistance, the government yielded, and Mussolini was asked by the king to form a ministry, with himself as premier. From that time forward, he was absolute dictator of Italy—assumed the chief portfolios, brought about changes in electoral laws to insure his continued power, established rigorous censorship of the press, and prosecuted and drove into exile his chief opponents.

In the early years of his dictatorship, Mussolini did bring to Italy a measure of economic health. It was in following his ultranationalistic

and ultramilitaristic foreign policy that the Italian people came to grief. In 1930, Mussolini denounced the provisions of the Versailles Treaty; in 1935–36, he invaded and conquered Ethiopia; and in 1937, he withdrew his country from the League of Nations because it approved sanctions against Italy. After the outbreak of the Spanish Civil War, Mussolini aided Franco's rebel forces, first secretly, later openly, with troops, arms, and money.

He took his country into the Second World War on the side of Germany on June 10, 1940, when Hitler's armies were overrunning France. Mussolini gained few of his expected spoils from France, and his subsequent campaigns in Greece and in North Africa turned into disastrous failures, prelude to Allied conquests of Tunisia and Sicily, and his resignation as premier, on July 25, 1943. After his liberation from Italian custody, Mussolini was installed as head of a puppet, Axis-occupied Italian state, with its capital first in Rome, later in northern Italy. Even this nominal authority was short-lived. On April 26, 1945, Allied armies captured Verona and Parma, and Italian Partisans joined in fighting disintegrating Fascist and German forces. On that day, Mussolini attempted to flee to Switzerland from his Lake Garda villa; was captured by Partisans at Nesso on Lake Como; and two days later was executed, with his mistress Clara Petacci and a number of Fascist officials, on the outskirts of the village of Como. The bodies of the dictator and his mistress were taken to Milan, where they were subjected to mob abuse, and later buried in unmarked graves in the pauper section of the city's cemetery.

NATAL. See SOUTH AFRICA, UNION OF.

NATIONAL ACADEMY OF DESIGN. Oldest organization in the United States with a membership composed exclusively of artists. Its present membership, comprising painters, sculptors, architects, workers in the graphic arts, and aquarellists, is divided into two groups, associates and academicians. When an artist is elected an associate of the academy, he presents the organization with a diploma portrait; when an associate is elected an academician, he presents the academy with one of his own works of art. Through this qualification procedure, the academy has accumulated an extremely valuable art collection which stands as a record of the progress and development of American art and architecture. Women as well as men are eligible for membership which is limited to professional artists.

The following events comprise the National Academy exhibition season of 1944–45: British-American Good Will Exhibition, Nov. 9 to Dec. 2, 1944; 29th Annual of the Society of American Etchers, Inc., Nov. 10 to Dec. 5, 1944; National Academy First Annual Exhibition of Contemporary American Drawings, Dec. 13, 1944 to Jan. 10, 1945; 1945 Exhibition of Paintings by Merchant Seamen of the United Nations, Dec. 13, 1944 to Jan. 10, 1945; 78th Annual Exhibition

of the American Water Color Society, Jan. 19 to Feb. 7, 1945; National Academy 119th Annual Exhibition, March 14 to April 3, 1945; 53d Annual Exhibition of the National Association of Women Artists, April 21 to May 19, 1945.

The National Academy acts as trustee of the Ranger and Abbey funds, both of which are used to finance scholarships, awards and purchases of works of art for donation to other public institutions. It also maintains a free school where painting, sculpture, drawing, and mural painting are taught. Hobart Nichols is president of the academy and John Taylor Arms is first vice president. Headquarters: 1083 Fifth Avenue, New York 28, N.Y.

KATHLEEN JOHNSTON,
Librarian, National Academy of Design.

NATIONAL ACADEMY OF SCIENCES. The. This scientific body originated from the need of the government for technical scientific advice in connection with the Civil War. Its charter, passed by Congress and approved by President Lincoln in 1863, provides that it "shall, whenever called upon by any department of the Government, investigate, examine, experiment, and report upon any subject of science or art, the actual expense of such investigations . . . to be paid from appropriations which may be made for the purpose, but the Academy shall receive no compensation

whatever for any services to the Government of the United States."

The academy's membership is limited to 450 citizens of the United States and 50 foreign associates. There are no applications for memberships. Nominations are presented by the sections representing different sciences.

In order to permit the organization of the nation's scientific resources on a more inclusive scale than was possible within the membership of the academy itself, the National Research Council was organized by the National Academy of Sciences at the request of President Wilson in the spring of 1916, and was established on a permanent basis on May 11, 1918, by presidential executive order, "to promote research in the mathematical, physical, and biological sciences, and in the application of these sciences to engineering, agriculture, medicine, and other useful arts, with the object of increasing knowledge, of strengthening the national defense, and of contributing in other ways to the public welfare."

The membership of the council is composed largely of appointed representatives of approximately 85 of the major scientific and technical societies of the country, together with representatives of certain other research organizations, representatives of government scientific bureaus, and a limited number of members at large. These members are appointed by the president of the National Academy of Sciences. Serving on committees of the council are approximately 1,800 outstanding scientists.

The Academy-Research Council does not maintain scientific laboratories but functions through sponsorship of conferences, technical committees, surveys, scientific publications, and administration of funds for research projects and fellowships.

The administrative costs of the academy and council are charged against the income of a permanent endowment, given together with the building, by the Carnegie Corporation. Financial support of scientific projects is obtained from contracts with government and private agencies and from special grants from foundations, societies, and individuals.

Many highly confidential projects contributing directly to the war effort were financed through contracts with the Office of Scientific Research and Development, the War Production Board, War and Navy departments, and other federal agencies, as well as by grants from various sources.

The academy issues the *Proceedings*, *Scientific Memoirs*, and *Biographical Memoirs*. An *Annual Report* is made to Congress and published.

The council issues a series of *Bulletins and Reprints*, and *Circulars*. A list of publications, with prices, is available upon request.

Academy officers: Frank B. Jewett, president; Luther P. Eisenhart, vice president; Detlev W. Bronk, foreign secretary; F. E. Wright, home secretary; J. C. Hunsaker, treasurer; George B. Darling, executive secretary.

Council officers: Ross G. Harrison, chairman; George B. Darling, executive secretary.

The building of the National Academy of Sciences and the National Research Council is located at 2101 Constitution Avenue, Washington 6, D.C.

GEORGE B. DARLING,
Executive Secretary, National Academy of Sciences and National Research Council.

NATIONAL ARCHIVES. Established by an act of Congress approved June 19, 1934, the National

Archives preserves the noncurrent records of the United States government that have administrative, legal, research, or other value and makes them accessible in order that the recorded experience of the nation may be available to guide and assist the government and the people in conducting their affairs.

The National Archives has in its custody about 700,000 cubic feet of records received from Congress, the White House, every executive department, most of the independent agencies, and several of the federal courts. Nearly a third of them relate to military affairs; these include the main bodies of noncurrent records of the War and Navy departments, many army and navy field records, and most of the service and pension records through the First World War. Diplomatic, consular, and administrative records of the State Department through 1929, records of hundreds of diplomatic and consular posts, and most of the older records of the Treasury and Justice departments are in the National Archives. Records from the Interior Department Archives include the basic files on Indian affairs, lands, mines, reclamation, national parks, and the administration of the territories. All noncurrent records in Washington of the Agriculture Department and large portions of Commerce, Labor, and Post Office Department records have also been received. Among them are records of the documentation of vessels, 1789-1942; schedules of censuses of population, 1790-1870; and weather records, 1819-1943. Records of several recently liquidated war agencies, such as the Office of Civilian Defense and the Office of War Information, have also been received.

These records include 400,000 maps and charts, of which 190,000 are manuscript or annotated—the largest collection of such maps in the country; 7,500,000 running feet of motion-picture film, from early "nickelodeon shows" to the latest newsreels; 95,000 sound recordings, including many recordings of broadcasts; and 1,200,000 photographic items.

The National Archives serves the government and the public by making available the records in its custody or information from them. Its central search rooms are open from 8:45 A. M. to 10 P. M., Mondays through Fridays, and from 8:45 A. M. to 5:15 P. M. on Saturdays. Many individuals consult the records for historical or genealogical information or for data for the protection of their rights and property. Last year federal agencies used such records as transcripts of enemy broadcasts, files on alien property, and materials on the artificial-limb industry. Information on reconversion problems was in great demand; both government and industry were furnished data on the cancellation of contracts, the disposition of surplus property, and the termination of economic controls following the First World War. A notable service rendered the military authorities was the compilation of lists of European and Asiatic archival agencies and their contents and of manuals on the use of the records which contributed toward their protection and effective utilization by the Allied forces.

Records significant in the nation's history are made available to the public in the Exhibition Hall. Circular No. 6, *The National Archives of the United States [with] Catalog of Exhibit*, describes the functions of the agency and a general exhibit including such documents as the Bill of Rights. The major special exhibit of the past year is described in a catalog, *President Roosevelt and International Co-operation for War and*

Peace; the German and Japanese surrender documents, which were added to this exhibit, are reproduced in facsimile in publications in press. Other recent publications include *How to Dispose of Records—A Manual for Federal Officials* and several *Reference Information Circulars* designed to furnish to government officials clues to information in the records on a wide variety of problems.

Through the Division of the Federal Register, the National Archives keeps the public informed of federal regulations. All proclamations, orders, and rules of the government that have general applicability and legal effect are published in the *Federal Register* and the division's files of such regulations are open to public inspection. A *Cumulative Supplement to the Code of Federal Regulations* (in 10 books) was recently published.

The Franklin D. Roosevelt Library at Hyde Park, N. Y., is a part of the National Archives Establishment.

SOLON J. BUCK,
Archivist of the United States.

NATIONAL ASSOCIATION OF MANUFACTURERS (NAM). This association, which had its origin in a convention of several hundred representative American manufacturers who met in Cincinnati, Ohio, celebrated its 50th anniversary Jan. 22, 1945. The first annual convention of the association was held in Chicago, Ill., Jan. 21, 1896, when the name, The National Association of Manufacturers of the United States of America, was adopted; a preamble setting forth the objects of the association was published; and a constitution was adopted. In 1945 the association had more than 14,000 active members and approximately 1,200 associate members. Affiliated with the association is the National Industrial Council, a federation of some 300 national, state, and local associations of employers. The association is governed by a board of directors of 150 members which meets nine times a year. Fifteen hundred executives representing industries, large and small, in all parts of the United States, serve on standing committees and special committees of the association and meet at various times throughout the year to reconcile geographical and industrial difference on all subjects of general interest to industry. The entire list of the associations' activities are too numerous to mention in the space available. Headquarters of the organization are located in New York City. Offices are maintained in Washington, D.C., San Francisco, and Los Angeles, while regional offices are maintained in Chicago, Ill.; Dallas, Texas; Denver, Colo.; Atlanta, Ga.; St. Louis, Mo.; Philadelphia, Pa.; Portland, Oreg.; and Seattle, Wash. The president in 1945 was Ira Mosher. Robert R. Wason was chosen president for 1946. Noel Sargent is secretary.

NATIONAL BUREAU OF STANDARDS. See STANDARDS, NATIONAL BUREAU OF.

NATIONAL CHILD LABOR COMMITTEE. See CHILD LABOR COMMITTEE, NATIONAL.

NATIONAL CIVIC FEDERATION, The. An American organization founded in 1900 by Ralph Montgomery Easley, its purpose being: "To provide for a thorough discussion of questions of national import affecting either the foreign or domestic policy of the United States, to aid in the crystallization of the most enlightened public sentiment of the country in respect thereto, and, when desirable to promote necessary legislation in accordance therewith."

Vital questions discussed in *The National Civic Federation Review* to aid in clarifying the public mind, during 1945, included: "The Profit System—The Wage System," portraying individual opportunities afforded under capitalism; "Men, Books and our Constitution," depicting the influence of ancient and contemporary writers upon the minds of the framers of our Constitution; "Post War Activities of Industrialists," related to world trade and domestic proposals; "Some Labor Problems Here and Abroad,"—our wage policy—radical program of British Labor Party—Free Trade Unions in foreign countries; "Proposed Expansion of Federal Social Security System"; "Coat of Arms, Crest and Great Seal of the United States"; "The Railroads and Railway Brotherhoods"; "Timely Admonitions of Thomas Jefferson"; "Our Farm Problem"; agriculture's contribution toward victory; and "Proposal for Return to the International Gold Standard."

The federation's special Department on Patriotic Education of the Youth has concentrated its efforts upon counteracting the ideologies of the dictators. It has distributed among educators and placed in classrooms of social science studies in public schools in hundreds of cities sound pronouncements enunciating the ideals of American statesmen. Through contributions of public spirited citizens, it has provided gratis a replica of the beautiful Gaspard portrait etching of *Abraham Lincoln* as well as his golden words stressing the right of ownership of private property, the opportunity of the laborer today to become the employer tomorrow, the equal rights of men, affirmed by our republican form of government; and the *Gettysburg Address*. It also distributed a replica in nine colors, with its historical development, of the Great Seal of the United States of America as well as a Students' Study Sheet. Among other documents issued and distributed are the *Bill of Rights*, and a photographic copy of the original of the Constitution of the United States of America, with a special treatise on its making.

The federation's directing heads are: C. S. Breckenridge, chairman, executive council; H. B. Lounsbury, assistant to the chairman; Mrs. Ralph M. Easley, secretary, executive council; Leland L. Rounds, secretary-treasurer; Gustave A. Gerber, general counsel; Phillip J. Sawyer, director, Department of Youth Education. National headquarters are located at 112 Park Avenue, New York 17, N.Y. Branch offices are maintained at 139 North Clark Street, Chicago 2, Ill., and 80 Boylston Street, Boston, Mass.

MRS. RALPH M. EASLEY,
Secretary, Executive Council, The National Civic Federation.

NATIONAL EDUCATION ASSOCIATION OF THE UNITED STATES (NEA). A national professional organization of teachers and others engaged in educational work "to advance the interest of the teaching profession, promote the welfare of children and foster the education of all people." Willard E. Givens, executive secretary; William G. Carr, associate secretary; Karl H. Berns, assistant secretary; headquarters building, 1201 Sixteenth Street, N.W., Washington, D.C.

Officers.—F. L. Schlagle, superintendent of schools, Kansas City, Kans., president; B. F. Stanton, associate professor of education, Mount Union College, Alliance, Ohio, treasurer; Mrs. Mary D. Barnes, principal, William Livingston school, Elizabeth, N.J., first vice president. There are eleven other vice presidents. Honorary presi-

dents are John Dewey, professor-emeritus, Columbia University, New York City, and Mrs. Susan M. Dorsey, superintendent-emeritus, Los Angeles, Calif.

Members of the executive committee are: Mr. Schlagle; Mrs. Edith B. Joynes, principal, Gatewood school, Norfolk, Va.; Mrs. Barnes; Joseph H. Saunders, superintendent of schools, Newport News, Va.; Mr. Stanton; Leonard L. Bowman, vice principal, high school, Santa Barbara, Calif.; Glenn E. Snow, president, Dixie Junior College, Saint George, Utah; Emily A. Tarbell, high school teacher, Syracuse, N.Y.; and L. V. Phillips, commissioner, Indiana High School Athletics Association, Indianapolis.

Members of the Board of Trustees are: Mr. Saunders, chairman; Mr. Schlagle; Edgar G. Doudna, Board of Normal School Regents, Madison, Wis., vice chairman; Florence Hale, editor, *The Grade Teacher*, Darien, Conn., secretary; and Myrtle Hooper Dahl, teacher, Minneapolis, Minn.

Departments.—The association is composed of 29 departments serving the fields indicated by their names: Adult Education; American Association for Health, Physical Education and Recreation; American Association of School Administrators; American Association of Teachers Colleges; American Educational Research Association; American Industrial Arts Association; Art Education; Business Education; Classroom Teachers; Elementary School Principals; Garden Education; Higher Education; Home Economics; International Council for Exceptional Children; Kindergarten-Primary Education; Lip Reading; Music Educators National Conference; National Association of Deans of Women; National Association of Journalism Directors; National Association of Teachers of Speech; National Council for the Social Studies; National Council of Administrative Women in Education; National Science Teachers Association; Rural Education; Secondary Teachers; Supervision and Curriculum Development; Visual Instruction; and Vocational Education.

Membership.—The NEA is the largest professional organization in the world. In 1945 it had a direct membership of 331,605, and a combined membership of 900,000. Many states are adopting a plan to have unified membership in local, state and national teachers' organizations.

Committees.—Much of the work of the NEA is done through commissions and committees. Special deliberative bodies are known either as councils or commissions. These include: Educational Policies Commission; Legislative Commission; National Commission for the Defense of Democracy through Education; National Commission on Safety Education; National Council of Education; and the National Council on Teacher Retirement.

Standing committees carry on continuous programs of study, interpretation and action. These committees are: Citizenship, Credit Unions, International Relations, Professional Ethics, Tax Education and School Finance, Teacher Preparation and Certification, and Tenure and Academic Freedom. Joint committees with other organizations having mutual interests in specific problems include association with the American Legion, the American Library Association, the American Teachers Association and the National Congress of Parents and Teachers.

Publications.—The *Journal of the National Education Association*, published monthly during the school year, circulates to all members. The association *Journal* and the 22 periodicals of the departments of the NEA are a clearing house for

information and discussion of significant problems facing American education. Approximately 270 other publications of the organization and its departments and committees were issued during 1945. Subjects included technics of teaching; source materials for teachers; research studies on teacher welfare, school administration and teaching problems; committee and commission reports; news bulletins; yearbooks on current topics and methods; and policy statements.

Education for All American Youth, a document which outlines the characteristics of a new postwar program for secondary education, was published by the Educational Policies Commission. It is being used as a textbook and as a basis for legislation.

Conventions.—Due to wartime travel conditions, all conventions of the association and its departments were canceled.

Conferences.—The first White House Conference on Rural Education was held Oct. 3-5, 1944, upon invitation from the President and Mrs. Roosevelt. Called, planned and directed by three divisions of the NEA, the conference was attended by 230 leaders in education, government, labor, industry, and agriculture from 45 states. The report of the conference was published and includes speeches, discussions, and committee recommendations. A Charter for the Education of Rural Children was drafted.

A work conference on the educational problems of veterans was held by the NEA at the headquarters building Feb. 26-28, 1945, with leaders in adult education, veterans groups, government, labor, agriculture, and business attending. The conference recommendations have led to amendments (now in Congressional committees) to the "GI Bill of Rights." The report of the conference has resulted in special appropriations by many state legislatures to provide for expanded educational facilities for the returning veteran, and serves as a basis of planning by school systems.

Education and the Peace.—The organized teaching profession of the United States was primarily responsible for the provision in the United Nations Charter for an international agency to promote educational and cultural co-operation. Dr. William G. Carr, associate secretary of the NEA and secretary of the Educational Policies Commission, was appointed a consultant to the American delegation to the United Nations Conference on International Organization by the Department of State. Regional conferences were held throughout the nation to consider the Educational Policies Commission's publication, *Education and the People's Peace*, urging the establishment of an international agency for education as part of the world organization. The NEA and many of its departments were members of the Liaison Committee for International Education. Members of the NEA testified during hearings on the Mundt resolution which passed the House of Representatives unanimously and which called for an international office of education as a force in maintaining the peace.

Teaching materials on the Dumbarton Oaks proposals and the United Nations Charter were prepared and widely distributed.

Legislation.—The primary emphasis has been placed on securing federal appropriations to the states for more adequately financing public elementary and secondary education. Both the Senate and the House of Representatives committees on education have held hearings on the NEA-backed Thomas-Hill (S.181) and Ramspeck (H.R.1296)

bills. These bills are designed to meet the crisis of classrooms without teachers, and to lessen inequalities of educational opportunity. They guarantee freedom of the states from federal interference in school administration, personnel, curriculum, instruction, methods of instruction, and materials of instruction.

Representatives of the NEA testified during Congressional hearings on the school lunch bills, government surplus property, universal military training and federal aid to public colleges. In addition the association is working for the enactment of amendments to the "GI Bill of Rights," as recommended by the Veterans' Education conference. Witnesses testified during hearings on the Mundt resolution and before the Senate Foreign Affairs committee, urging adoption of the United Nations Charter.

Special Projects.—Three new divisions were established during the year: audio-visual instructional service, adult education service and the division of travel service.

A series of state conferences was held by the National Commission for the Defense of Democracy through Education to study postwar problems and education.

At the request of education and civic groups in Chicago, Ill., and the nation, the Defense Commission conducted a six-months' investigation of personnel practices in the Chicago public schools. The commission has also taken measures to restore unjustly discharged teachers to their positions and to maintain freedom of the teachers from political interference.

Ten million parents and other citizens visited the schools during American Education Week, a project jointly sponsored by the NEA, the American Legion, the National Congress of Parents and Teachers, and the United States Office of Education.

NADINE GOLLADAY,

Office of Public Relations, National Education Association.

NATIONAL GEOGRAPHIC SOCIETY. The. Founded in 1888 in Washington, D.C., "for the increase and diffusion of geographic knowledge," this society now has 1,400,000 members. In 1945 the National Geographic Society and Cornell University continued their joint research project for a systematic study of the aurora borealis, under the leadership of Dr. C. W. Gartlein. The primary observatory is at Ithaca, and supplemental bases have been established at Hamilton and Geneva, all in New York. In addition, a network of 25 co-operating stations has been set up, ranging from Oregon to Prince Edward Island, and from north of Lake Superior south to Ithaca. From many of these scattered observation posts it is possible to observe auroral displays even when weather conditions obscure them at other stations. During the year observers were able to detect an increasing number of auroras not visible to the unaided eye, by the development of instruments, some of which make use of extremely sensitive photoelectric cells. The simplest of the mechanical aids is a series of colored filters which held before the eye make faint auroral lights visible during twilight and moonlight. The photoelectric instruments indicate the presence of auroras even when heavy clouds make them invisible. They also make a complete automatic record of auroral lights, visible and invisible, when no observer is present. A vast fund of information has been collected by the project and is being steadily increased. It will be used for future

analysis in studying certain unknown aspects of auroras.

During 1945 the society sent out its second annual expedition for the study of North American birds, under the leadership of Dr. Arthur A. Allen. The season's work was carried on along the north shore of the Gulf of St. Lawrence (Quebec Province, Canada) and on the adjoining islands which contain Canadian bird sanctuaries. The studies included the making of natural color photographs of auks, murres, puffins, cormorants, eiders and red-throated loons in their nesting areas.

The National Geographic Society-Smithsonian Institution Expedition to Mexico to study remains of the Olmec culture centered its investigations in 1945 in the highlands near Tuxtla Gutierrez in the State of Chiapas. One of a group of eight mounds was excavated and was found to cover a complicated structure of limestone blocks unlike any previously discovered. The expedition also explored a number of caves used as dwellings or refuges and now containing numerous specimens of pottery. On the Rio Chiquito in southern Veracruz State the party discovered, late in the season, an area rich in gigantic carved stone heads, altars, monuments, and other art objects. The site will be developed by future expeditions.

The society's cartographic department produced during the year four 10-color wall maps, three of them covering areas in the eastern war theaters. They were the Philippine Islands, China, Northeastern United States, and Japan and Korea. Some of the cartographic material used in compiling the map of the Philippine Islands was obtained from data assembled over a 40-year period by the Coast and Geodetic Survey and the Army Map Service, which were saved from the Japanese by a last minute transfer to Corregidor and shipment from there by submarine. The map of China shows the vast sweep of that country extending from Russia's Tadzhik Republic on the west to the China Sea on the east and from Russian territory marked by the Amur River on the north to French Indochina and India on the south. The map shows Outer Mongolia, recognized as independent in August 1945. The spellings of the place names on the chart were adopted after a careful sifting of spellings according to numerous Chinese dialects. On the map are traced China's vital highways including the Red Route from Chungking via Chengtu to Ayaguz, Russia, and the Stilwell Road from the Assam border of India across Burma to Kunming in Yunnan Province. The chart of Japan and Korea represents those countries on a large scale depicting in detail the home islands of the shrunken empire and its one-time most important mainland possession, now freed. Insets show fringes of the former empire, especially important in the closing days of the war: Formosa, Ryukyu Island chain, Karafuto, the southern half of Sakhalin Island. Another inset shows Manila, Tokyo and Attu Island of the Aleutians as points on the same Great Circle route. The map of Northeastern United States, including portions of southern Canada covers an area into which is crammed North America's greatest concentration of population and industrial activity. It embraces the southern four of the five Great Lakes and extends westward to include Michigan and Indiana, and southward to take in all of Ohio, Pennsylvania, Maryland, and the District of Columbia, and parts of Kentucky, West Virginia and Virginia. This portion of the United States, only 12 per cent of its area, shelters nearly half the popu-

lation of the United States, and in 1944 turned out 73 per cent of its factory production. In the part of Canada mapped dwell almost two-thirds of the Dominion's total population, and in the area are situated nearly three-fourths of the nation's factories. The chart contains 10,437 place names, a greater number than has appeared on any other map published by the National Geographic Society.

Franklin L. Burr prizes, each carrying an award of \$1,000, were granted to Dr. Lyman J. Briggs for outstanding work in directing field expeditions of the society; and to Dr. Thomas A. Jaggar for developing the first "duck" or amphibian mobile boat in 1927—a combination beach automobile and boat used in explorations near Pavlof Volcano in Alaska.

Five series of paintings made especially for reproduction in color in the *National Geographic Magazine* were published during the year. These were "Fairy Wrens of Australia," by N. W. Cayley; "Wildlife of Tabasco and Veracruz" (Mexico), by Walter A. Weber; "Totem-Pole Builders," by W. Langdon Kihn; "Victory's Portrait in the Marianas," by William F. Draper, and "Science Works for Mankind," by Thornton Oakley.

News Bulletins describing and giving background information in regard to places and areas affected by war activities and postwar reconstruction problems were distributed to more than 500 daily newspapers and approximately 200 radio stations. A special series of feature stories accompanied by maps "Orphan Areas of Europe," were published in 175 Sunday newspapers. Illustrated *School Bulletins* embodying information similar to that in the *News Bulletins* were sent each week of the school year to 35,000 classrooms.

Officers.—President and editor, Gilbert Grosvenor; vice president and associate editor, John Oliver La Gorce; secretary, Thomas W. McKnew; and treasurer, Robert V. Fleming.

GILBERT GROSVENOR,
National Geographic Society.

NATIONAL HOUSING AGENCY (NHA). The National Housing Agency (John B. Blandford, Jr., administrator) was established by executive order on Feb. 24, 1942. It consolidated in a single agency the non-farm housing functions of the federal government. Policies were centered in the office of the administrator and operations were carried out through three major constituent units: the Federal Home Loan Bank Administration; the Federal Housing Administration; and the Federal Public Housing Authority.

With the end of the war, the National Housing Agency immediately directed its efforts to stimulating the largest possible volume of home construction and combating inflationary price trends resulting from the acute shortage of housing throughout the country.

Wartime controls on building were removed almost entirely through the rescinding of the War Production Board's Conservation Order L-41 on Oct. 15, 1945. A substantial core of the home building industry had been kept active during the war and as early as 1944 had been enabled to start constructing houses approximating peacetime standards through a transitional program to relieve congestion, authorized as the job of housing war workers drew near completion.

From the long-range point of view, the NHA estimated that the country needs 12,600,000 new dwellings in the next 10 years to meet

the needs of returning veterans, new families and families now living doubled up, and to replace one half of the clearly substandard housing, and that which becomes substandard by 1955.

The NHA reported that construction of a million and a quarter houses a year would mean an investment of 6 to 7 billion dollars annually and would provide about 4,000,000 jobs, off and on the building site. To achieve these ends, and to move toward a goal of a decent home for every American family, the NHA has proposed to Congress: (1) a broad program of technical research aimed at aiding the building industry to reduce costs; (2) help to local communities in studying and analyzing their own housing problems and mapping out programs to meet the needs of all income groups; (3) aids to communities, through long-term, low-interest rate loans, accompanied by subsidies if necessary, to clear slums and blighted areas and prepare the land for redevelopment at economically sound costs; (4) extension of the FHA insurance program to encourage the industry to produce housing, both for rent and sale, in the vast market represented by families of moderate incomes; (5) continued federal aid to communities to provide low-rent, public housing for families of very low incomes.

The War Job.—At the conclusion of its war job, the NHA had carried out a program to provide the necessary shelter at the right time and in the right places to meet the needs of some 4,000,000 migrating war workers and their families—an estimated 9,000,000 persons altogether.

Mobilization of existing housing under the leadership of the NHA and with the co-opera-

FINAL WAR HOUSING FIGURES July 1940–August 31, 1945

	Completed	Under construction	To be started ¹
H-1: Housing for In-migrant War Workers			
Privately-financed ² (total).....	1,009,001	26,487	20,702
New permanent units.....	810,711	25,671	18,580
Converted units.....	198,290	816	2,122
Publicly-financed (total).....	832,241	22,004	4,978

Grand total—All War Housing: H-1, H-2, H-3.....	1,883,790	122,323	124,980

¹ "To be started" is housing which was approved as of V-J Day; Publicly-financed housing in this category was terminated and privately-financed quotas which had not been taken by builders were withdrawn. Publicly-financed war housing under construction was terminated where it was in the public interest.

² Approximately 18,000 veterans who wished to build their own homes had H-3 priorities as of August 31.

tion of local communities provided quarters for approximately 2,000,000 of these workers, 600,000 with families. Housing for the others had to be created by converting existing structures and by new building. This additional housing was programmed by the NHA and built in 1,300 localities scattered throughout the United States and its outlying territories. Private financing supplied 1,051,549 dwelling units at an approximate cost of \$4,300,000,000, most of it covered by FHA war housing mortgage insurance, by Aug. 31, 1945. Public financing supplied 832,241 units at a cost of \$2,600,000,000. The war housing program ended Aug. 31, 1945, and on Oct. 15, 1945, the WPB Order L-41, a war measure which restricted residential building to quotas established by the NHA, was lifted.

(2) FEDERAL HOME LOAN BANK ADMINISTRATION

This administration (John H. Fahey, commissioner) directs the operations of the Federal Home Loan Bank System and the Federal Savings and Loan Insurance Corporation—two permanent agencies established to encourage home ownership and economical home financing, and to protect savings. Also under the supervision of the administration is the Home Owners' Loan Corporation, an emergency agency founded to aid distressed home owners and stabilize investments in residential real estate during the depression.

Federal Home Loan Bank System.—Authorized in 1932, the system provides a nation-wide home-mortgage credit reserve for thrift and home-financing institutions. Following the national pattern set up for commercial banks in the earlier inauguration of the Federal Reserve System, 12 regional Federal Home Loan Banks were organized, each to serve member home-financing institutions in its area by making both short and long-term advances to meet their needs. Through the regional banks, funds may be shifted from areas of abundant credit to areas of scarcity. Since the establishment of the banks, they have advanced \$1,497,966,000 to their member institutions, of which \$112,450,000 is outstanding.

On Aug. 31, 1945, member institutions of the system totaled 3,699. Of these, 3,659 were savings and loan associations, co-operative banks and homestead associations, including 1,469 Federal Savings and Loan Associations for whom membership is mandatory; 25 mutual savings banks and 15 insurance companies. Assets of member institutions amounted to \$8,087,000,000 on Aug. 31, 1945.

Federal Savings and Loan Insurance Corporation.—In 1934 Congress provided an insurance program for investors in savings and loan associations and similar home financing institutions by creating the Federal Savings and Loan Insurance Corporation. Federal Savings and Loan Associations were required to be insured; insurance is optional for state chartered associations. The public confidence inspired by the fact that investments are so safeguarded has provided a steady flow of funds into insured savings institutions. About 4,300,000 investors in 2,475 savings and loan associations, with combined assets of nearly \$5,700,000,000, are now protected by insurance up to \$5,000 each.

Home Owners' Loan Corporation.—Over a period of three years following its creation in 1933, the Home Owners' Loan Corporation refinanced the mortgages on more than a million homes. Approximately \$3,093,000,000 was loaned to

home owners, an amount increased to \$3,490,000,000 by later advances to borrowers and other disbursements by the corporation.

More than 73 per cent of this investment has been liquidated through collections on the corporation's loans and the sale of properties securing its loans which it was obliged to take over by foreclosure. Although the agency was forced to acquire a total of 198,127 houses, all but 663 had been sold by Aug. 31, 1945.

On that date HOLC was collecting on 515,684 accounts—391,732 those of original borrowers and the rest purchasers of acquired properties. Borrowers, plus purchasers of HOLC houses, had paid off their accounts in full, to a total of 488,109. More than 84,000 borrowers were making monthly payments in amounts greater than called for by their contracts.

(3) FEDERAL HOUSING ADMINISTRATION

This administration (Raymond M. Foley, commissioner) was established in June 1934 by the National Housing Act "to encourage improvement in housing standards and conditions, to create a sound mortgage market, and to provide a system of mutual mortgage insurance" as part of the program to help revive the construction industry and the home financing market. The FHA does not itself make loans but insures private lending institutions against loss on residential loans meeting FHA standards.

The maximum FHA interest rate today is 4½ per cent plus the FHA insurance premium of ½ of 1 per cent, both calculated on annual outstanding balances. The premium is deposited in the Mutual Mortgage Insurance Fund.

Peacetime functions of the FHA are carried out under Titles I and II of the National Housing Act. Title VI was added as a war measure in March 1941 to help provide private housing, temporarily meeting emergency war housing needs but designed and built for permanence.

Title I provides for government insurance to lending institutions on loans for property improvement, alterations and repairs. Most of these loans are limited to a maximum amount of \$2,500 and a maximum term of 3 years, and are repaid through monthly installments. However, as part of the war program, Congress authorized the FHA to increase from \$2,500 to \$5,000 the size of individual loans under this title, and with longer maturities, where operations would provide additional living accommodations for war workers through conversion of existing structures in areas specifically designated by the president. Under wartime conditions, many types of Title I loans were subject to Regulation W of the Federal Reserve Board requiring shorter maturities than the maximum permitted by the National Housing Act. This restriction was lifted in regard to property improvement loans in October 1945, when wartime construction controls also were removed.

Title II provides for insurance of mortgage loans ranging up to \$16,000 made by approved private lending institutions, and for monthly amortization of the loan over periods as long as 20 years. Such loans may cover either new or existing housing, but generally may not exceed 80 per cent of the property valuation. Where loans are for not more than \$5,400, however, and cover new single-family, owner-occupied homes built under FHA inspection, the mortgage may be made for 90 per cent of the appraised value and may have an amortization period as long as 25 years. On new owner-

occupied homes valued at not more than \$10,000, mortgages may cover 90 per cent of the first \$6,000 of valuation and 80 per cent of the remainder up to a maximum mortgage of \$8,600, with a maximum term of 20 years. Under Title II, the FHA also provides mortgage insurance for large-scale rental projects.

Title VI was added to the National Housing Act by Congress in March 1941 specifically to assist in providing housing for war workers. Insurance activity under this title ended in August 1945. Most of FHA's operations during the war period were conducted under this new title. Mortgages insured under it were limited to a maximum of \$5,400 on a single-family house; \$7,500 on a two-family house; \$9,500 on a three-family house; and \$12,000 on a four-family house, and could cover up to 90 per cent of FHA valuation. Approximately 450,000 dwellings for war workers were provided by mortgages insured under this title, for which the total insurance authorization provided by Congress was \$1,800,000,000.

From the start of the national emergency in July 1940 up to the surrender of Japan, approximately 750,000 new privately financed dwelling units were started under all FHA titles.

The long-term program of the FHA has enabled more than 1,600,000 families to build, purchase, or refinance their homes, or to rent modern quarters. FHA insurance on residential mortgages, excluding Title VI war housing, is now more than \$5,133,000,000 and FHA repair loans under Title I, exceeding more than 5,000,000 in number, aggregate \$1,903,733,000. As of Aug. 31, 1945, approximately \$2,090,689,150 of the mortgage loans and more than \$1,600,000,000 of the repair loans had been repaid through regular monthly payments or prepayments.

The FHA's credit experience under its mortgage insurance program has been outstanding. Out of 1,112,005 small homes financed with mortgages insured under Title II, only about 4,065, or 1 out of every 2,800, had been foreclosed and transferred to the FHA by Aug. 31, 1945. All but 7 of these properties have been resold. Since 1940, the FHA's income from its insurance premiums and investments has been sufficient to meet all operating expenses and to add substantial amounts to insurance reserves.

(4) FEDERAL PUBLIC HOUSING AUTHORITY

This authority (Philip M. Klutznick, commissioner) has responsibility for federally administered public housing programs. Its major peacetime activity is the low-rent and slum clearance program transferred from the United States Housing Authority. It administers the programs of loans and annual contributions which enable the communities to provide decent housing at rents that low-income families can afford to pay.

Toward the end of 1945, while legislation formulating a national housing policy was pending before the Congress, the FPHA had four principal functions:

1. The management of public war housing during the period of reconversion and demobilization for distressed families of veterans and servicemen, for civilian employees of the War and Navy departments and of private industries completing war contracts, and for distressed families dislocated or displaced as a result of the war or demobilization.

2. The disposal of public housing determined to be surplus to the above needs.

3. The administration of the low-rent housing built before the war, and the conversion of war housing under the United States Housing Act to low-rent status.

4. The reactivation of deferred low-rent projects as building labor and materials become available.

Before the outbreak of war interrupted construction of low-rent housing under the United States Housing Act, local housing authorities in 173 communities built 334 projects containing 105,600 units for low-income families formerly living in slum dwellings.

The total development cost of the prewar low-rent projects was \$483,000,000. Although the FPHA is authorized to lend up to 90 per cent of the development costs, it has actually supplied only two thirds of the long-term financing, as a result of the ability of local housing authorities to sell bonds on the private market at an interest saving.

To help keep rents within the means of low-income families, the FPHA makes an annual contribution, or subsidy, which for 1944 totaled \$8,600,000, or \$7.19 per dwelling unit per month. To June 30, 1945, federal subsidy payments totaled \$43,409,000; this represents the entire cost to the federal government since the beginning of the low-rent program. In addition, the local community is required to make an annual contribution equivalent to at least one fifth of the federal contribution. This is normally done by exempting the projects from state and local taxes, as authorized by the United States Housing Act and state housing laws.

HOUSING BUILT OR AUTHORIZED UNDER U. S. HOUSING ACT AS OF AUGUST 31, 1945

	Projects	Dwelling units
Low-rent, pre-war (Public Law 412)	334	105,625
Low-rent for war use (Public Law 412) 49	49	11,930
Low-rent funds used for war housing (Public Law 671)	202	52,786
Deferred low-rent	164	23,225
Total	749	193,566

The major wartime function of FPHA was to provide publicly-financed housing for in-migrant war workers and their families; the FPHA being responsible for the construction and management of about four fifths of the total provided. The remainder was provided by other agencies, principally the War and Navy departments and the United States Maritime Commission. For the total public war housing program, some \$2,600,000,000 was made available, all from Congressional appropriations or loan authorizations except \$29,000,000 expended by the New York State Division of Housing.

HOWARD F. VICKERY,
Director of Information, NHA.

NATIONAL INSTITUTE OF ARTS AND LETTERS.

The National Institute of Arts and Letters was founded in 1898 by the American Social Science Association and incorporated by act of Congress in 1904, for the furtherance of literature and the fine arts in the United States. Its membership is limited to 250 native or naturalized citizens qualified by notable achievements in art, music and literature.

On May 18, the institute, together with the American Academy of Arts and Letters, held their fourth joint public ceremonial at which new members of both organizations were inducted (Frank W. Benson and Edward Hopper, painters; Jerome D. Kern, composer, as members of

the institute), medals awarded and fifteen \$1,000 "Arts and Letters Grants" given. These grants are awarded from time to time to nonmembers to further creative work in the arts. The institute awarded its gold medal to Paul Manship, for sculpture, and its "award for distinguished achievement, given to an eminent foreign artist, composer or writer living in America," to Richard Beer-Hofmann. An exhibition of sculpture by Paul Manship, together with the works of newly elected members and the recipients of art grants was opened in the art gallery and continued through June 29. The institute continued its annual gift of \$1,000 to the Edward MacDowell Association, Peterborough, N.H., of two National Institute of Arts and Letters fellowships of \$500 each in memory of Edward MacDowell and Edwin Arlington Robinson.

The annual meeting of the institute took place on Dec. 19, 1945. Its present officers are: Arthur Train, president; Henry Seidel Canby, secretary; Philip James, treasurer; vice presidents: William Rose Benét, Leonard Bacon, William Adams Delano, Leon Kroll, Douglas Moore, and Edward McCartan.

The institute occupies the same building as the American Academy of Arts and Letters, 633 West 155th Street, New York City.

FELICIA GEFFEN,

Assistant to the President, American Academy of Arts and Letters.

NATIONAL INSTITUTE OF HEALTH. See PUBLIC HEALTH SERVICE, UNITED STATES.

NATIONAL JEWISH WELFARE BOARD (JWB). This organization is comprised of the Young Men's Hebrew Associations, the Young Women's Hebrew Associations, and the Jewish Community Centers. Constituted April 9, 1917, to serve United States Army and Navy personnel of the Jewish faith, it is also the authorized national Jewish body serving the armed forces in time of war. It was one of the seven national welfare organizations fulfilling this function during the First World War, and was a member organization of the United Service Organizations during the Second World War. It serves veterans in active association with the Jewish War Veterans of the United States, these two organizations constituting the sole Jewish agencies accredited to the United States Veterans' Administration.

The board is composed of 289 constituent local societies, of which 276 are located in the continental United States, eight in Canada, and one each in Honolulu, Havana, Mexico City, Sydney (Australia), and London. The board's constituent bodies in the United States are organized into the following regional sections: New England, New York State, New York Metropolitan, New Jersey, Middle Atlantic states, Midwest, Southern, and Pacific Coast Federation of Jewish Community Centers. The membership of the local organizations aggregates approximately 500,000. Thirty-eight national Jewish civic, cultural, fraternal, and religious organizations in the United States are affiliated with the board.

Officers of the board include Frank L. Weil, president; Lieut. Col. Lloyd W. Dinkelspiel, Irving Edison, Mrs. Walter E. Heller, Carl M. Loeb, Jr., Donald Oberdorfer, Walter Rothschild, Mrs. Felix M. Warburg, vice presidents; Max Wilner, treasurer; Joseph Rosenzweig, secretary; Ralph K. Guinzburg, assistant secretary; and Louis Kraft, executive director.

The organization maintains headquarters at 145 East 32d Street, New York 16, N.Y.

NATIONAL KINDERGARTEN ASSOCIATION. See KINDERGARTEN ASSOCIATION, NATIONAL.

NATIONAL LABOR RELATIONS BOARD. Ten years ago the National Labor Relations Act was passed by Congress and signed by President Roosevelt to insure American workers the right to organize and bargain collectively. The three-man board, in charge of administering this law, has two basic duties: first, the board conducts elections to determine freely chosen representatives for collective bargaining purposes. Second, the board protects employees from discrimination in any manner by the employer because of their union membership or activities.

This protection is provided in Section 8 of the act which enumerates five unfair labor practices an employer may not engage in to defeat his employees' right to self-organization. Specifically, an employer may not (1) interfere with, restrain, or coerce employees in their self-organization rights; (2) dominate, interfere with, or support the formation of any labor organization; (3) discriminate in any manner in regard to the hire or tenure of employment in order to encourage or discourage membership in a union; (4) discharge or otherwise discriminate against an employee because he has given testimony under the act; and (5) refuse to bargain collectively with the majority-designated representatives of his employees.

In the ten-year period, over 77,000 cases have been filed with the board. Of these, 37,300 involved unfair labor practice charges and 39,950 concerned questions of representation. The greater proportion of these, 62,000, were disposed of informally, without the necessity of hearings, decisions, or subsequent court litigation.

The board issued 11,000 formal decisions in the decade. Problems arising over representation issues were settled in 8,600 of these decisions, while the remaining 2,600 board orders concerned employer unfair labor practices.

Decisions and orders of the board are not self-enforceable. There are no penalties or fines. Either the company or the board may petition the appropriate circuit court of appeals for enforcement. Following this, either party may petition the Supreme Court for review. It is only after a court has upheld a board order and an employer has refused to comply that he may be held in contempt of court and subject to court penalties.

Since its existence, over 600 board cases have been litigated in the Circuit Courts of Appeals and the Supreme Court. In the circuit courts, 343 of the board's orders were upheld in full; 78 were set aside; and 167 were enforced with modification. Of the 55 cases that reached the Supreme Court the board's orders were upheld in 53 cases; in only 2, less than 4 per cent, were board orders set aside.

The American workers' and employers' response to the democratic election procedures of the board can be summed up thus: In the ten years of the board's operations, over 6,000,000 men and women, 85 per cent of those eligible to ballot, have voted in 24,000 board-conducted elections to select their representatives for collective bargaining purposes. Of these 24,000 elections, only 6,900 were held pursuant to board orders; the remainder, or 72 per cent of all elections, were based and conducted on the

complete agreement and mutual arrangement of the parties.

In 20,000 elections a majority of employees voted for a union. In 9,545 polls the CIO was successful in obtaining representation rights; AFL affiliates scored in 7,945; unaffiliated unions were chosen in 2,510; and no union was selected in the remaining 3,850 ballots.

As for the 37,300 unfair labor practice charges filed in the ten years, 36,000, or 92 per cent of them, were disposed of informally. The greater number of these, 15,390, were settled by agreement between the parties, while 2,245 of them were closed after compliance with intermediate reports, board or court orders. Regional directors dismissed 5,785 cases; 305 were dismissed by intermediate reports and board or court orders; 11,870 were withdrawn by the parties; and the remaining 405 cases so disposed of were dismissed by the board for lack of merit or jurisdiction.

In remedying the unfair labor practices the board ordered the reinstatement of 300,000 employees, 30,000 of whom received back pay awards to compensate them for the losses in pay incurred as the result of employer discrimination. These back-pay awards totaled approximately \$9,000,000. Over 2,000 company unions were ordered disestablished. In 5,000 cases collective bargaining was ordered, while in 7,000 cases notices of compliance with board decisions were directed to be posted. These posted notices informed employees that they were free to engage in collective activity without interference, as guaranteed by the act.

LOUIS G. SILVERBERG,
Director of Information, National Labor Relations Board.

NATIONAL PARK SERVICE. A bureau of the United States Department of the Interior established by act of Congress dated Aug. 25, 1916 (39 Stat. 535). Throughout the fiscal year ended June 30, 1945, the National Park Service, even though operating with a curtailed wartime staff and faced with the problem of caring for a greater number of visitors than during the preceding war years, continued to perform in a creditable manner its primary function of protecting, for present as well as future generations of Americans, the national parks and allied areas entrusted to its care.

Highlights of the Year.—One of the highlights of the 1945 fiscal year, from the standpoint of the National Park Service, was the presidential veto on Dec. 29, 1944, of H. R. 2241 to abolish the Jackson Hole National Monument, Wyo., an area established by presidential proclamation of March 15, 1943. In his memorandum disapproving this bill, the late President Franklin Delano Roosevelt pointed out that the effect of this bill would be to deprive the people of the United States of the benefits of an area of national significance from the standpoint of naturalistic, historic, scientific, and recreational values. He also stated that whatever reasonable objections existed to the continuance of the monument could be overcome without depriving the area of the protection to which it was justly entitled; that the proper remedy of the situation was not the undoing of what had been done but the making of such adjustments as might be appropriate to meet local conditions. As a result, no doubt, of the controversy over the establishment of this monument, several bills were introduced in the 79th Congress having for their purpose the modification or abolishment of the

Antiquities Act of 1906 (34 Stat. 225), under which the president has authority, by public proclamation, to set aside as national monuments places of national interest from a scientific, historic, or archaeological standpoint to insure their protection. By the close of the fiscal year no Congressional action had been taken on these bills. Also pending in the 79th Congress on June 30, 1945, was a second bill, H. R. 2109, to abolish the monument, and H. R. 2691, to provide for the transfer of the public lands in the monument to United States Forest Service jurisdiction. Still another bill H. R. 1292, to provide for payments to Teton County, Wyo., and to continue grazing and other permits within the monument, likewise was pending in the Congress at the end of the year. In February 1945, the validity of the monument's establishment was upheld by the Federal District Court of Wyoming in a suit entitled *State of Wyoming v. Paul R. Franke*.

Other 1945 fiscal year highlights were the heightened interest of foreign governments in the organization and administration of the National Park System of the United States and in land conservation generally; the holding of a United Nations ceremony in the heart of the majestic redwoods of Muir Woods National Monument, Calif., to honor the memory of the late President Roosevelt; resumption of the night-time lighting of the Statue of Liberty, New York, one of the national monuments administered by the National Park Service; the sharp decline in applications for military and other wartime utilization of service-administered areas; reduction of surplus wildlife in Rocky Mountain National Park, Colo., and Zion National Park, Utah; and removal of provisions for special care of bison in Yellowstone National Park, Wyo.-Mont.-Idaho.

The National Park Service was requested by other federal agencies, notably the Bureau of Reclamation and the Corps of Engineers, War Department, to assist them in the investigation and planning of recreational facilities and in the administration of such facilities. There was also a resumption of co-operative planning relationships with the states under the provisions of the Park, Parkway, and Recreational Area Study Act of 1936 (49 Stat. 1894).

National Park System.—On July 14, 1944, Richmond National Battlefield Park, Va., scene of several battles fought in the War Between the States in the defense of Richmond, the Confederate capital, was established. Lands in this park, totaling 684.44 acres, were turned over to the federal government by the Virginia Conservation Commission.

Two units were eliminated from the National Park System. On March 1, 1945, Chattanooga National Cemetery, Tenn., was transferred to War Department jurisdiction, and Camp Blount Tablets National Memorial, Tenn., was given the status of a project when it was ascertained that requirements of the act of Congress of 1930 authorizing its establishment as a memorial have not been met.

At the close of the 1945 fiscal year, the National Park System contained 20,473,415.15 acres (exclusive of 611,082.50 acres of nonfederally owned lands), and included 27 national parks, 4 national historical parks, 84 national monuments, 11 national military parks, 1 national battlefield park, 7 national battlefield sites, 10 national historic sites, 9 national memorials, 11 national cemeteries, 3 national parkways, and the System of National Capital Parks, a total of 168 units.

Two of the 18 recreational demonstration areas

—Falls Creek Falls and Shelby Forest Recreational Demonstration Areas, Tenn.—which the service has been administering on a temporary basis were transferred to Tennessee for state park purposes, in accordance with the terms of the act of June 6, 1942 (56 Stat. 326), and some of the land in Otter Creek Recreational Demonstration Area, Ky., was transferred to the War Department as an addition to Fort Knox.

Use of National Park System by Visitors.—During the 1945 travel year (Oct. 1, 1944 to Sept. 30, 1945) visitors to the National Park System totaled 10,099,900. As during the preceding war years, no effort was made by the National Park Service to encourage travel to the areas administered by it and only limited accommodations were operated by concessioners to care for those persons able to take advantage of the opportunities for relaxation and inspiration which a visit to these areas afforded. From the beginning of the travel year on Oct. 1, 1944, to the middle of August 1945, when word was received of the surrender of Japan and the cessation of gasoline rationing, travel to the National Park System increased approximately 13 per cent as compared with a similar period during the 1944 travel year. From mid-August through the Labor Day week-end throngs visited many units of the system, taxing to the limit the available overnight accommodations. Approximately 2,330,000 of the visitors who entered park and monument gateways in 1945 were members of the nation's armed forces.

Necrology.—The service was saddened by the deaths of the following men who contributed much to the furtherance and development of park ideals and policies: George B. Dorr, "father" of Acadia National Park, Me., and superintendent of that area from the time of its establishment in July 1916, as *Sieur de Monts National Monument*; Charles L. Gable, former supervisor of concessions; Edmund H. Abrahams, of Savannah, Ga., chairman of the Advisory Board on National Parks, Historic Sites, Buildings, and Monuments; and Col. David C. Chapman, who played a major role in the movement which led to establishment of Great Smoky Mountains National Park, Tenn.—N.C.

A. E. DEMARAY,

Associate Director, National Park Service.

NATIONAL PARKS, CANADIAN. See CANADA'S NATIONAL PARKS.

NATIONAL RECREATION ASSOCIATION, The. In 1945 the National Recreation Association started its 40th year of nation-wide service in bringing every child in America a chance to play and everybody in America, young and old, an opportunity to find the best and most satisfying use of leisure time. The war years brought to the recreation movement a tremendously increased public interest and demand for help all over the country in establishing new recreation programs and in extending existing programs and making them more effective. Services of the association, which is supported by voluntary contributions, is limited only to the extent of its financial resources.

Nearly 600 cities received periodic personal service by district field workers of the association in 1945. Leadership was provided to nearly 100 communities in conducting local community-wide training institutes for employed and volunteer workers in various types of recreational activities. About 50 cities received special field service in connection with their problems for meeting the recreation needs of their colored communities.

Again in 1945 more than 6,000 communities were helped through correspondence services of the association, and several thousand individuals were aided through personal consultation at its headquarters. More than 25,000 different requests for advice and material were cared for during 1945.

The interest of workers and management in the conduct of recreation activities for industrial workers continued during the year. Of particular interest was the request from smaller industries for help in meeting the needs of their workers as effectively as they are being met in some of the larger plants of the country. In view of this demand the association prepared and distributed a special article, *Recreation for Workers in Small Plants*. The association continued to assign a special worker full time to assist industries with the recreation problems of their workers. Several hundred plants were personally visited in about 100 different communities throughout the country.

The success of special publications for servicemen such as *Fun En Route* and *More Fun En Route* led to the preparation, on request, of a third booklet, *World of Fun*. Two million copies of this were printed and distributed to members of the armed forces. This brings the total number of booklets distributed without charge to members of the armed forces to twelve million copies.

During the year a survey was made of community recreation developments in 1944 and published as the *Recreation Year Book* in the July 1945 issue of *Recreation*. The results of this year book indicate a very substantial increase in recreation services during the two-year period since the last previous year book was published. The following are the outstanding figures of local recreation as reported by community recreation agencies in 1,426 communities:

Number of cities with play leadership or supervised facilities	1,426
Total number of separate areas reported	17,320
Total number of play areas and special facilities reported:	
Outdoor playgrounds	10,022
Recreation buildings and indoor recreation centers	4,536*
Bathing beaches	564
Day camps	342
Golf courses—9 hole	176
Golf courses—18 hole	253
Swimming pools—indoor	352
Swimming pools—outdoor	1,095
Total number of employed recreation leaders	35,503
Total number of leaders employed full time the year round	4,870
Total number of volunteers	47,288
Total expenditures for public recreation	\$38,790,623

* Of this number, 1,813 were reported operated as, or containing, youth centers.

The conclusion of the war stimulated thorough study and reorganization of future programs and plans, and among the recreation problems of the future which require thorough consideration now are: sound local recreational planning for the development of new facilities and areas, and the extension and improvement of old areas; co-operative planning and joint consideration of new recreation areas and facilities by all agencies concerned, such as city recreation departments, park departments, schools, public housing authorities, and planning boards; adequate provision for recreation in all neighborhood redevelopment plans, new public housing units, new private real estate subdivisions and other areas newly opened for residential use; provision for adequate outdoor areas and for the full community use of school buildings in all school construction programs; consultation of recreation leaders by school and

housing architects and planners; full use of existing areas and facilities available for recreation use; employment of an adequate number of trained competent recreation leaders, with special emphasis on year-round full-time leadership in neighborhoods; participation of successful programs for helping returning veterans to be reabsorbed into normal leisure-time living in their home neighborhoods and communities; employment of returning veterans qualified for recreation leadership, with necessary care for the protection of personnel standards.

ARTHUR WILLIAMS,
National Recreation Association.

NATURALIZATION. See IMMIGRATION, EMIGRATION AND NATURALIZATION.

NAURU. An isolated Pacific island 26 miles south of the equator at longitude 166° E., a mandate of the British Empire held jointly by Great Britain, Australia, and New Zealand. The area is 8.43 square miles, and the population on Jan. 1, 1942, numbered 2,672 (1,827 Nauruans, 193 other Pacific islanders, 584 Chinese, and 69 whites). An administrator named by Australia (Lieut. Col. F. R. Chalmers appointed Oct. 1, 1938) exercised all powers of government until the island was occupied by the Japanese late in August 1942. Revenue in 1941 amounted to £12,023 (£33,084 in 1939), and expenditure was £23,951. Sole economic value of Nauru lay in its deposits of phosphates, worked by the British Phosphates Commission, (having a British-Australian-New Zealand membership); exports in 1941 totaled 99,150 tons (808,400 tons in 1940), valued at £69,375 (£541,168 in 1940).

Nauru was discovered in 1798 by Captain Fearn, of the United States whaler *Hunter*, and by him named Pleasant Island; the name Nauru was resumed when it was annexed by Germany in 1888. An Australian force seized Nauru on outbreak of the First World War in 1914, and the island became a mandate on Dec. 17, 1920. Mining installations on Nauru were shelled by a German raider on Dec. 27, 1940, but life was otherwise uneventful in the Second World War until August 1942, when Japanese forces took possession of the island. There then ensued a horrifying sequence of murders and cold-blooded cruelties not exceeded anywhere during the war. On March 28, 1943, United States airmen bombed Nauru for the first time, and the following night, in reprisal, Captain Solda, commander of the Japanese garrison, beheaded Colonel Chalmers, the captive administrator, together with the medical officer and several officials. Two missionaries who had remained on the island were transferred to the Carolines, as well as 1,200 Nauruans (the Pleasant Islanders), including the head chief and most of the Nauruan women. Subsequently some 300 Japanese died of starvation, and when food supplies were completely exhausted, the survivors resorted to cannibalism, killing and eating their own countrymen and also Chinese laborers. Nauru was surrendered by the Japanese to Brig. J. R. Stevenson, of the Australian Army, on Sept. 14, 1945, and rehabilitation started.

NAVAL AVIATION. See AERONAUTICS.

NAVAL EDUCATION. The Allied victory has eliminated, probably for all time, the naval

schools maintained by each of the former Axis powers: the German Naval School formerly located at Flensburg and the Imperial Naval Academy of Japan located at Etajima, with two smaller schools at Maidzuru and Tokyo. There are still seven major nations that maintain schools for the instruction of junior naval officers, all members of the United Nations and three of them members of the British Commonwealth of Nations. They are:

The United States.—The United States Naval Academy, founded in 1845, located at Annapolis, Md., is the largest institution of its kind in the world. Its four-year course of instruction leads to a B.S. degree and to the commission of ensign in the regular navy or of second lieutenant in the Marine Corps. The four-year course is supplemented by special training in aviation and in submarine duty for those graduates meeting the necessary qualifications. Most of its graduates serve in the line, with a few going to the Construction Corps, the Supply Corps, and the Marine Corps. The course of study at the academy includes English, American and European history, naval history, diplomatic history, one modern language (French, Spanish, Italian, German, Portuguese or Russian), government, mathematics, physics, chemistry, electrical engineering, marine engineering, seamanship, navigation, ordnance and gunnery, as well as physical training and hygiene.

Five midshipman appointments are allowed for each senator, representative, delegate in Congress, and the vice president, 5 for the District of Columbia and 25 are appointed each year from the United States at large. The law also authorizes the appointment of 100 enlisted men from the United States Navy and Marine Corps and 100 from the Naval Reserve and Marine Corps Reserve. For detailed information on additional sources of appointments and on entrance requirements, inquiries should be addressed to the Bureau of Naval Personnel, Navy Department, or the United States Naval Academy at Annapolis. Each candidate must be an unmarried male citizen of the United States not less than 17 years of age nor more than 21. There are three distinct methods of qualifying mentally for admission: (1) regular entrance examinations; (2) certificates from an approved secondary school plus a substantiating examination in English and mathematics; and (3) a properly attested certificate that he is or has been a regularly enrolled student in good standing without condition in a university, college or technical school accredited by the United States Naval Academy. (See also EDUCATION, REVIEW OF.)

Great Britain.—The Royal Naval College at Dartmouth trains about 65 per cent of the officers of the British Navy. It was founded in 1902. On passing their final examinations the students (known as cadets) are sent to sea for a further period of training before being rated midshipmen. The primary object of cadets and midshipmen serving afloat is to enable them to obtain experience in their duties as officers and to train them in watch-keeping, boat work and drill. They are given, too, a certain amount of practical and theoretical instruction. After serving for 20 months afloat the midshipmen are examined in seamanship. Those who pass are advanced to acting sub-lieutenant and are then sent home to take professional courses as a preparation for promotion to the rank of lieutenant. During the war cadets were promoted to midshipmen on passing their final examinations at Dartmouth.

Three classes enter the Royal Naval College annually—in January, May and September. The course consists of 11 terms of four months each, a total of three years and eight months. There are six major subjects taught at Dartmouth: English, French, mathematics, science, navigation and seamanship. In addition, in peacetime, about 33 per cent of the line officers receive training as "special entry cadets." These cadets enter the service either from the public schools or the merchant marine. These "special entry cadets" are given courses on a training ship in seamanship, navigation, pilotage, engineering, ship construction, torpedoes, gunnery, electricity, mathematics, French and physical drill. In addition about two per cent of the line officers come up from the enlisted ranks. Temporary officers of the R.N.V.R. are, without exception, drawn from the lower deck. These men receive a limited training on H.M.S. *King Alfred*. The average age of each applicant for the Royal Naval College at Dartmouth is only 13½. He must be 12½ years old at the time of application. The average age of "special entry cadets" is from 17 to 18 years. Both "special entry cadets" and cadets at Dartmouth must be native born of British or British-naturalized parentage and of pure European descent. Candidates must pass rigid physical and mental entrance examinations.

Canada.—The Royal Canadian Naval College is located at Royal Roads, on the southern end of Vancouver Island, British Columbia. It was re-established in 1942 after a lapse of twenty years since the closing of the old college known as the Royal Naval College of Canada. Its primary function is to train cadets who can aspire to and assume positions of leadership in Canadian naval affairs, a naval career not being obligatory of its graduates. Those of its graduates who do not enter the Royal Canadian Navy (permanent force) are under an obligation to accept a commission in the Royal Canadian Naval Reserve or the Royal Canadian Naval Volunteer Reserve should their services be required. During wartime all graduates are required to serve in some capacity in the naval service. In peacetime they may return to civil life. It is expected that at least thirty graduates will be selected for entry into the Royal Canadian Navy (permanent force). Those selected are promoted midshipmen, R.C.N. and go to sea for further training in the big ships of the Royal Navy or the Royal Canadian Navy. But those who have elected the Engineering Branch are sent to the Royal Naval Engineering College at Devonport, England, for advanced study. The remainder of the graduates who have elected to enter the Royal Canadian Volunteer Reserve (hostilities only) are promoted to midshipmen, R.C.N.V.R. and are appointed to the smaller ships of the Royal Canadian Navy or the Royal Navy. The length of the college course is two years. Three branches of the service are open to the cadets: The Executive Branch; the Engineering Branch; and the Accounting Branch. Normally about 80 per cent enter the Executive Branch, 10 per cent the Engineering, and 10 per cent the Accounting Branch. The course of study at the college includes English, a modern language (French, Spanish or German), history, mathematics, mechanics, physics, chemistry, engineering, seamanship, pilotage and navigation, gunnery, torpedo and signals. A candidate for entrance must be not less than 15 years, 10 months nor more than 18. He must be an unmarried British subject and his parents must have resided in Canada for two years im-

mediately before his entrance. Each candidate must pass a written competitive examination early in May. To pass the candidate must gain at least 50 per cent in each paper and attain an average of not less than 60 per cent.

Australia.—The Royal Australian Naval College was opened in 1913 at Geelong, Victoria, Australia, but in 1915 it was transferred to Jervis Bay, New South Wales. In 1930 the college was moved again to Flinders Naval Depot, Victoria, where it is still operating. On entry the boy becomes a cadet midshipman and on graduation he becomes a midshipman. After some two or three years of sea service, in which he has shown proficiency, and having satisfied examiners in professional subjects, he is commissioned a sub-lieutenant. The four-year course of study comprises seamanship, engineering, navigation, mathematics, physics, chemistry, history, English, and French, together with considerable practical work in professional subjects. The cadet midshipman must reach the age of not less than 14 years during his first year in college and must be not older than 16. The entry to the college is open to all sons of natural-born or naturalized British subjects, subject to their being up to the educational standards and physically fit. Candidates are first of all required to pass a medical examination and a written examination in arithmetic, geometry, geography, English, history, and certain voluntary subjects. Those who successfully pass these examinations appear before a board of examiners who select the ultimate candidates. After leaving the Royal Australian Naval College the subsequent training examinations and training are generally carried out in the same manner as in the Royal Navy.

France.—The École Navale of France was maintained at Brest before the war. (The school is again in operation.) Each year the representatives of the Board of Naval Officers make tours of the 15 principal cities and conduct written examinations for the candidates. From these candidates the board makes its final selection. Between 80 and 100 candidates are chosen each year on the basis of these competitive tests. The candidate must be over 16 and not over 21 when he takes the entrance examination. He must also prove that he is of French birth or is a naturalized Frenchman. The course is two years in length. The subjects included in the curriculum are navigation, infantry and physical training, artillery and mechanical engineering, history, French composition, astronomy, algebra, naval architecture, geography, meteorology, optics, torpedoes, mechanics, compass, the tides, and thermodynamics. Young men admitted to the school must sign an enlistment in the navy for six years dating from their graduation from the school. After completion of one year's service and having passed their final examinations, they are given the rating of midshipman. Midshipmen who pass their final examinations on completion of their second year are appointed ensigns 2nd class. Courses at the academy include technical, literary, and scientific courses and foreign languages. Students who fail to pass final examinations and are not authorized to repeat the course are required to serve as enlisted men for one year unless they have completed one year of military service before entering the academy. Those who leave the school for any cause are required to complete, as enlisted personnel, the legal duration of the required service. About 90 per cent of the officer personnel of the French Navy are graduates of the École

Navale at Brest, 5 per cent come from the École Polytechnique and 5 per cent come up from the ranks. The two years of academic work are followed by one year's training on the *Jeanne d'Arc*, the French training ship.

The buildings of the present École Navale are located on the south shore of Brest harbor on the site of the former Lanveoc-Poulmic seaplane base. The professors and students are housed in these buildings. The length of the curriculum has been reduced since the war, a few theoretical courses such as astronomy being curtailed. But considerable time is devoted to the study of modern weapons, artillery, machine guns, radar, and to aviation. It is expected that all students will graduate with an observer's license and future classes with a pilot's license. A few yachts are available for learning the art of sailing and four corvettes for learning nautical routine. Three destroyers are also available for a summer cruise to some foreign country in the summer of 1946.

Classes at Brest started on May 15, a week after the surrender of Germany, and are scheduled to last 12 months but will probably be continued for 15 months. During their course students are sent to Paris three times for visits of 8 to 10 days. There they visit large industrial plants, public airports, the French Naval Museum, and are given lectures on colonial affairs. A preparatory examination was held in 1945 for recruiting 100 regular students for the École Navale. This class, after a two-month course at the training center of Pont Rean, on October 1, were assigned to warships due to leave for the Far East. On this cruise the students will serve as apprentice boatswains and signalmen. These cadets were scheduled to start regular courses at the École Navale at Brest on April 1, 1946.

During the war a naval academy was maintained at Casablanca which trained the classes graduated in 1943 and 1944. This school was the continuation of the one functioning at Portsmouth, England, in 1941. In the early part of the war a naval academy was maintained for a time at Toulon which in October 1943 was moved to Clairac in southwest France. The students of the 1942 class which were partially trained at Toulon were regrouped at Clairac. The students at this school joined the Maquis in August 1944 and fought against the German pocket on the Atlantic coast at Royan.

Italy.—The Italian Naval College was founded by Cavour in 1860 and has been located at Livorno (Leghorn) since 1881. The college was evacuated to Venice early in the Second World War with two sailing vessels, the *Christopher Columbus* and *Vespucci*. There were 700 cadets in Venice when the order came to sail for a southern Italian port with as much equipment as possible. A disused Fascist naval preparatory school was found and the boys were at work within 24 hours. There were in April 1945, 500 cadets at the school and a long waiting list for entries. The course consists of three years of academic training, supplemented, in peacetime, at the end of the first and second years by three-month practice cruises; at the end of the third year the cadets go to sea as "about-to-be-ensigns," and after 6 months are examined and commissioned. The cadets are divided into 3 groups each of which is given a separate course of instruction; about 70 per cent are educated as line officers; 15 per cent as engineer officers; and 15 per cent as ordnance officers. The cadet personnel is selected by the authorities of the

academy itself. Candidates must be under 20 years of age, but there is no minimum age limit.

Russia.—The Soviet government has taken great pains to train its officers. According to the Administration of Naval Schools, there are 11 naval schools now open for the training of junior officers. These schools give courses in aviation, engineering, communications, artillery, and naval command. For the most part these schools are in Leningrad and Sevastopol, though there is a Pacific Naval College and a Naval Coast Defense School at Vladivostok, as well as a Caspian Naval College at Baku-Zykh. The candidates must be from 17 to 22 years of age, have had complete middle schooling—the 10-year school or its equivalent, except for the coastal artillery division which may accept candidates with 9 years of schooling. They must be physically fit, and must pass entrance examinations in Russian grammar and literature, algebra, geometry, trigonometry, physics, mechanical drawing, and current events. In addition, candidates must bring recommendations from the Young Communist League or party organization, or from their factory or collective farm governing committee or school principal.

LOUIS H. BOLANDER,

Associate Librarian, U. S. Naval Academy.

NAVAL PROGRESS. The year 1945 saw the greatest of all wars pass into history with the Germans surrendering on May 8 and the Japanese on September 2. The navies of the United Nations played a vital role in the defeat of the Axis powers. Never before has the decisive effect of overwhelming sea power been better illustrated. A relentless sea blockade of both nations made actual exchange of war supplies between Germany and Japan virtually impossible. In the case of Japan, in the closing months of the war she was practically cut off from contact with her ill-gotten colonies and from her troops in outlying strongholds. At the same time Allied submarines played havoc with her remaining shipping.

Japanese Ships Lost.—Up to August 1, 1945, United States forces had sunk or damaged a total of 4,617 Japanese ships, or an average of 3 Japanese ships sunk or damaged every day for three and a half years. On Dec. 7, 1941, Japanese shipping tonnage was estimated at 7,000,000 tons. At the close of the war this had been cut down to less than 1,000,000 tons, and much of the latter was small coastal craft, unsuited for deep sea shipping.

German Ships Lost.—At the close of the war with Germany the British Admiralty and United States Navy Department disclosed jointly that at least 713 German submarines had been destroyed in the Battle of the Atlantic with "many others" destroyed by the Germans themselves in the final stages of the war. The British accounted for 462 U-boats and the United States Navy, in two years less of war, accounted for 151. British surface ships accounted for 205 of the total; aircraft 188; ships and aircraft jointly, 25; submarines, 25; bomb raids on U-boats afloat but in enemy ports, 8. American surface ships accounted for 30 submarines; aircraft, 77; ships and aircraft jointly, 13; submarines, 1; bomb raids on U-boats afloat but in enemy ports, 29. To the 613 thus accounted for there must be added 100 as being lost due to "mining" by Bomber Command, etc., the precise details of which are not yet available. The convoy system again demonstrated its efficacy for the Allies.

Allied Ships Lost.—On June 7, 1945 the United States Navy announced that less than one out of

every 1,000 ships convoyed by it were lost by submarines. From Dec. 7, 1941, to May 30, 1945, only 17 merchant ships were sunk and 15 damaged out of the 17,707 which sailed under protection of the United States Atlantic Fleet. But this report did not take account of the hundreds of unescorted vessels that fell victims to the U-boat. Three months after the opening of the war Winston Churchill, then first lord of the admiralty, announced that losses in convoys amounted to one in 750. In 1941 the ratio dropped to one out of every 181. Allied countermeasures advanced this ratio in 1942 to one loss for every 233, in 1943 to one in 344, and in the critical year of 1944, when our vast invasion armies in Europe were almost entirely dependent on seaborne supplies this ratio advanced to one loss for every 1,000. Nevertheless, the total Allied loss in shipping was exceedingly heavy, amounting to 4,770 ships, and a tonnage loss of 21,140,000, equal to the British Empire's entire prewar merchant fleet. German U-boats accounted for 2,770 of these ships, or about 58 per cent of the total; mines accounted for 520; surface craft for 330; aircraft for 750; while 400 were lost from various other causes. Over half of these shipping losses were British, amounting to 2,570 ships aggregating 11,380,000 tons; 538 ships were American; 1,172 were owned by our other Allies and 490 were neutral. These ships include Finnish, Hungarian, Italian and Japanese vessels lost before these countries went to war on the side of the Axis.

German Naval Developments.—The German Navy under Admiral Raeder and later under Admiral Doenitz were most resourceful in applying their scientific knowledge and ingenuity to devices that would enable them to win the Battle of the Atlantic. They developed the magnetic mine and the acoustic mine. They designed electrically propelled torpedoes with acoustic and magnetic control. They designed one-man submarines for attacks on Allied shipping where attacks by ordinary submarines would have been impracticable. They also designed surface torpedo boats manned by one man, who would guide his deadly craft near to his intended victims before abandoning ship. They invented the Schnorkel device, which consisted of a long tube passing from the submarine to the surface of the water to carry off noxious gases, enabling the U-boat to recharge its storage batteries without coming to the surface. They built large submarines to carry supplies to other submarines at sea, thus obviating the necessity of the dangerous, time-consuming voyage back to home bases. Under Admiral Doenitz the "wolf pack" system of submarine attack was organized, in which U-boats in large numbers made successive attacks over periods of days on large convoys.

Allied Countermeasures.—The Allies countered the magnetic mines with the "degaussing" belt. American overage destroyers, given to England in exchange for naval bases, were used in British convoy operations. Fast destroyer escorts, corvettes and frigates were built for patrol duty in the United States and Canada. Escort carriers were later developed giving convoys air cover in mid-Atlantic and in areas within range of land-based bombers. Radiolocation, or radar, revolutionized naval gunnery, or fire control. It made possible the detection of hostile submarines on the surface and the Asdic device detected those submerged. It aided in interception of enemy planes by shipborne aircraft, and provided a priceless navigational aid, enabling shipping to

proceed in fog and darkness. Russian-bound convoys on the route north of Murmansk were subjected to the heaviest attack by land-based aircraft, surface craft and U-boats, yet 88 per cent of all such shipments reached their destinations.

In the Pacific the Japanese Navy was reduced to a point where single Allied task forces could move at will, even close to enemy home shores without fear of surface attack. To keep the fleet mobile, well furnished with supplies and in fighting trim over 300 advance bases were established all over the world. From these advance bases men, material and weapons were delivered direct to the fighting fronts. In excess of 100,000 tons of supplies were moved each day, sufficient to fill the holds of 18 Liberty ships. The supplies handled at these advance bases include 5,000,000 different elements, ranging from breakfast foods to floating drydocks. One of the greatest instruments in naval administration was developed from this conception of assembling advance bases. It was called the "Functional Component Catalogue." From its lists a commanding officer could order base equipment necessary to support any operation. It could vary from three tons of material to an Advance Base Unit of several hundred officers and thousands of men, including Seabees to build the base. This Advance Base Unit could perform voyage repairs and repair minor battle damage to a major portion of the fleet. Floating drydocks were built in several sections and were moved as close to the combat zone as possible. There the sections were welded together. The largest of these drydocks had a lifting capacity of about 100,000 tons. In one 8-month period these floating docks handled 176 ships.

British and American Co-operation.—In the vast Pacific operations the British and American navies acted as a team. To the Allied surface forces in the Pacific in 1945 the British contributed 3 battleships, the *Howe*, *King George V* and the *Duke of York*; 5 fleet aircraft carriers, the *Formidable*, *Illustrious*, *Indefatigable*, *Indomitable* and *Victorious*; 5 light cruisers and 12 destroyers, while their fleet in the Indian Ocean, known as the East Indies fleet consisted of two British battleships, the *Queen Elizabeth* and the *Valiant*, the French battleship *Richelieu*, the British battle cruiser *Renown*; 4 escort carriers; 6 cruisers; and 14 destroyers. Perhaps one of the most significant naval operations of the year was the transport of Allied troops, tanks, guns and supplies over the Rhine in March 1945 in 36-foot LCVP's (landing craft, vehicles and personnel) manned by personnel of the United States Navy. These landing craft had been trucked overland from the English Channel to the Rhine.

The United States Navy.—On Oct. 1, 1945 it was announced that in the Second World War the United States Navy lost 2 battleships (the *Oklahoma* and the *Arizona*, both at Pearl Harbor), 5 aircraft carriers, 6 escort carriers, 7 heavy cruisers, 3 light cruisers, 71 destroyers, 11 destroyer escorts and 52 submarines, a total of 157 first-line fighting ships. In addition, 539 smaller vessels were lost, including minelayers, minesweepers, subchasers, gunboats, Coast Guard vessels, seaplane tenders, motor torpedo boats, landing craft, tugs, tankers, transports, and miscellaneous craft. Thus the United States Navy lost a total of 696 ships in less than four years of actual warfare. Nevertheless it still can boast a combat force of over 1,500 fighting ships, the greatest assemblage of sea power in all history. On July

1, 1940, the navy had on hand 383 combatant ships, and 1,322 ships have been added to this force. Deducting the 157 announced combat ship losses, brings the total to 1,548 fighting ships. From this number must be deducted an undisclosed number transferred to Allied navies. There still remains a total of 223 ships on building schedule in navy and in private shipyards. This record five-year construction program includes 331 ships built in navy yards and 991 in private shipyards. Navy yard construction included 7 battleships, 1 heavy cruiser, 58 destroyers, 155 destroyer escorts and 98 submarines. There were built in private shipyards 3 battleships, 13, 27,000-ton aircraft carriers, 9, 10,000-ton carriers, 105 escort carriers, 2 large cruisers, 9 heavy cruisers, 33 light cruisers, 312 destroyers, 393 destroyer escorts and 112 submarines. The remaining unfinished construction program includes 2 battleships, 3, 45,000-ton aircraft carriers, 9, 27,100-ton carriers, 2, 14,500-ton carriers, 26 escort carriers, 1 large cruiser, 22 heavy cruisers, 19 light cruisers, 87 destroyers, 16 destroyer escorts and 36 submarines. The great bulk of these ships was scheduled for completion in 1945 and 1946 with a few of the heavier units carrying over into 1947. With the surrender of Japan and Germany it seems doubtful that all these ships will be completed. Included with the fighting ships on hand when war broke out were auxiliary ships of many types—tankers, oilers, ammunition ships, transports, etc. making a total of 7,695 ships of all classes. In five years this fleet has grown until it now comprises 100,000 ships, to make the mightiest navy the world has ever known.

On Sept. 19, 1945, Secretary of the Navy James V. Forrestal asked Congress for a postwar fleet which would have a three-way task: (1) defense of the United States; (2) defense of the Western Hemisphere; (3) maintenance of world peace by contributing a big carrier task force punch to the International Security Council.

The secretary of the navy asked for an active fleet of about 28 per cent of the present force, no bigger than the pre-Pearl Harbor fleet, but with far superior fire power and aviation. It would include 11 modern battleships; 15 large aircraft carriers, including 3 of 45,000 tons; 21 escort carriers, 20 heavy cruisers, 29 light cruisers, 176 destroyers, 40 destroyer escorts and 90 submarines, plus the necessary auxiliaries and amphibious craft. The secretary plans for an "inactive" but battle-ready reserve of nearly 700 combat vessels, including 7 battleships, 22 aircraft carriers, 58 escort carriers, 33 cruisers, 191 destroyers, 256 destroyer escorts and 110 submarines. This reserve fleet would be kept ready to start firing at a moment's notice. It would be manned by only 40,000 men. To man the entire navy, "active and inactive," the secretary recommended a personnel force of 500,000, plus 100,000 marines. About 12,000 navy planes would be maintained, 8,000 of them in full active use.

Great Britain's Navy.—The Royal Navy now has 15 capital ships (14 battleships and the battle cruiser *Renown*) including H.M.S. *Vanguard* launched by Princess Elizabeth on Nov. 30, 1944; at least 13 fleet and light fleet aircraft carriers including the recently launched *Powerful* and *Leviathan*, over 40 escort carriers, 47 cruisers, over 300 destroyers, a still larger number of escort vessels (sloops, frigates, and corvettes), several fleet minelayers, and 128 submarines. On May 31, 1945, the Admiralty announced that losses entailed by the Royal Navy in its fight against the forces of Germany, Japan and Italy from Sept. 3,

1939 to V-E Day amounted to 3 battleships (the *Royal Oak*, *Prince of Wales* and *Barham*); 2 battle cruisers, (the *Hood* and *Repulse*); 8 aircraft carriers, 29 cruisers, 138 destroyers, 77 submarines, 16 armed merchant cruisers, 30 corvettes, 14 sloops, 11 frigates, 11 yachts, 1 monitor, 3 cutters, 7 gunboats, 242 trawlers, 6 minelayers, 61 minesweepers, 48 drifters, and 69 miscellaneous small craft and auxiliaries. In all, 776 ships of all categories were sunk, a tremendous fleet of fighting ships.

The Canadian Navy.—In September 1939 the Canadian Navy consisted of 16 vessels manned by 1,774 seamen. At the end of March 1945 its fleet consisted of 939 ships, of which 373 were combat ships. This fleet was manned by a force of 95,000 men at the end of the war with Germany. These ships sunk or helped to sink at least 68 enemy surface vessels, damaged 41 others, and captured 2 more. In addition they helped sink 23 enemy submarines and probably sank 8 others. During the course of the war the Royal Navy and the Royal Canadian Navy rendered each other mutual assistance. The mother country supplied Canada with one modern 8-inch cruiser of the "Fiji" class, one new 6-inch cruiser, 2 new fleet destroyers and 6 escort destroyers while large numbers of corvettes, minesweepers and frigates were built in Canada and transferred to the Royal Navy. Ships of the Canadian Navy operated during the past year with Admiral Sir Bruce Fraser's British Pacific Fleet. During the European phase of the war the Canadian Navy lost a total of 24 warships, including 6 destroyers with casualties of 2,300.

Germany's Navy.—The German Navy has ceased to exist. According to a British Admiralty statement issued May 16 the final disposition of the German Fleet was as follows: the 26,000-ton battleship *Gneisenau*, dismantled and sunk as a block-ship at Gdynia; the old battleship *Schleswig-Holstein* scuttled or used as a blockship at Gdynia; her sister ship the *Schlesien*, sunk at Swinemünde; the 19,250-ton aircraft carrier *Graf Zeppelin*, incomplete and damaged at Stettin; the 12,000-ton pocket battleship *Lützow* sunk in shallow water at Swinemünde; the 10,000-ton heavy cruiser *Admiral Hipper*, badly damaged in drydock at Kiel; the 10,000-ton heavy cruiser *Prinz Eugen* surrendered intact at Copenhagen on May 9; the 10,000-ton heavy cruiser *Seydlitz*, incomplete and blown up at Königsberg; the 6,000-ton light cruiser *Köln*, sunk in shallow water at Wilhelmshaven; the 6,000-ton light cruiser *Leipzig* badly damaged at the Danish port of Aabenraa; the 6,000-ton light cruiser *Nürnberg*, surrendered intact at Copenhagen; the light cruiser *Emden*, damaged and aground at Kiel. Besides these large ships, 24 destroyers, 12 torpedo boats, many U-boats and about 1,200 small craft, E-boats, R-boats, minesweepers, escort vessels, landing craft and armed trawlers were taken into custody at various Baltic ports. Three destroyers and two torpedo boats surrendered on May 9 to a British naval force at Copenhagen. Eleven destroyers were found at Kiel, and about a dozen scuttled U-boat, one destroyer, an escort vessel, four U-boats, and two minesweepers were found at Brunsbüttel. Two destroyers, 7 U-boats and 22 minesweepers and various small craft were found at Auxhaven. One destroyer and 12 minesweepers were found in good condition at Wilhelmshaven, but 24 U-boats had been scuttled. Distributed at several other ports were seven destroyers and eight torpedo boats. Nine sabotaged submarines were found at Bremen and seven submarines at

One-man submarines, Germany's last "secret weapon" remained on docks at IJmuiden, Holland.

Official U.S. Navy Photograph
Battleship finds plenty of room in this 10-section floating dry dock, an exclusive American development. Such docks played a vital role in the war in the far Pacific, saving valuable time for battle-damaged ships that would otherwise have to return many thousands of miles for repairs.

the island fortress of Helgoland. During the war the Germans used submarines of 230, 500, and 712 tons; the latter class took a leading part in raiding Allied shipping. In addition, they used three different types of midget submarines, the Biber, Molch and Seehund classes. The Biber is a six-ton, one-man submarine armed with two modified electric torpedoes. Propulsion is by a gasoline engine and an electric motor. The Molch is also a one-man submarine armed with electric torpedoes and electrically propelled. The Seehund is a two-man, 16-ton U-boat, armed with two 21-inch electric torpedoes fitted with magnetic pistols and net cutters, and propelled with a Diesel engine and an electric motor. Of these midget submarines 81 were either sunk, probably sunk or captured; 28 were possibly sunk. Since the capitulation of Germany, about 100 midget U-boats have been captured.

Italy's Navy.—Over 100 Italian warships served with the Allies during the last year of the war. They included the two modern 35,000-ton battleships, the *Vittorio Veneto* and the *Italia*; three old 23,600-ton battleships, the *Caio Duilio*, the *Andrea Doria* and the *Cesare*; 6 light cruisers; 4 Regolo class scout cruisers; at least 13 destroyers; 11 large torpedo boats; 24 submarines; a seaplane carrier, and other smaller units. In January 1945, five Italian warships, interned by Spanish authorities in the Balearic Islands, were released and steamed to Malta to surrender. They included one scout cruiser, 3 destroyers and a torpedo boat. Discipline in the Italian Navy is reported good and the morale excellent.

France's Navy.—It is now known that the old 22,000-ton battleship *Courbet* was sunk in June 1944 to help form a breakwater off the Normandy coast. She and her sister ship, the *Paris*, had fled to England in 1940, where the *Courbet* served as a training ship for the Free French naval forces, and the *Paris* was loaned to the Polish Navy as a receiving ship and barracks. More than 20 French warships have been repaired, refitted and modernized in United States navy yards. These include the battleship *Richelieu*, now serving with the British East Indies Fleet; the aircraft carrier *Béarn*, the cruisers *Georges Leygues*, *Montcalm*, *Emile Bertin* and *Jeanne d'Arc*, three destroyers and several submarines. Altogether 155 vessels have been transferred to the French Fleet by the United States Navy. This figure is made up of 6 destroyer escorts, 34 steel submarine chasers, 81 wooden minesweepers, 3 netlayers, 24 tugs, 3 tankers and 4 water barges. A British escort aircraft carrier, the *Biter*, built in the United States early in the war, has been transferred to the French Navy. This carrier is of about 10,000 tons displacement. Nearly 200 French fighting ships were in active service for the Allied nations when the war closed.

The Russian Navy.—The Soviet Navy is composed of four fleets, the Northern, Baltic, Black Sea and Pacific fleets. In addition there are flotillas on the Amur River, the Caspian Sea, the Danube, and the Dnieper rivers. The Soviet Baltic Fleet is believed to be made up of 1 battleship, 2 cruisers, 2 mine cruisers, 11 destroyers, and several submarines. During 1945 the Soviet Navy was very active in the Baltic Sea along the shores of which the German armies were steadily retreating. Motor torpedo boats, and submarines raised havoc with retreating Nazi troops and their supply lines. Several large units were also in action; the old 22,000-ton battleship *Oktia-bryskaya Revolutsia*, the modern heavy cruiser *Petropavlovsk* shelled enemy lines along the Bal-

tic. Altogether in the 37 months of war the Soviet Navy destroyed more than 2,000 warships and transports and 766 small craft. Soviet warships, the navy antiaircraft batteries and aircraft destroyed 6,829 enemy planes.

In part compensation to the Soviet Union for renouncing her share of the Italian Navy, it was announced by Prime Minister Churchill on June 5, 1944, that the following ships were transferred to the Soviet flag on May 30, 1944: By the United States, the light cruiser *Milwaukee* and a number of merchantmen; by Great Britain the battleship *Royal Sovereign* and nine overage destroyers obtained from the United States in exchange for naval bases: the *Brighton* (formerly *Cowell*); *Chester* (*Crowninshield*), *Churchill* (*Herndon*); *Georgetown* (*Maddox*), *Leamington* (*Twiggs*), *Richmond* (*Fairfax*), *Roxborough* (*Footie*), *St. Albans* (*Thomas*), *Lincoln* (*Yarnall*). The latter is not in operating condition but will be useful for supply parts. In addition the British have transferred to the Soviets three 730-ton submarines, the *Unbroken*, *Ursula*, and *Unison* and the 960-ton submarine *Sunfish*. The *Royal Sovereign* has been renamed the *Arkhangelsk*, and the *Milwaukee* the *Murmansk*.

The Japanese Navy.—The final remnants of the Japanese Navy have been surrendered and that navy as a fighting unit has ceased to exist. In the last week of the war Japan had just one undamaged major ship, the cruiser *Sakawa*. Other major vessels remaining on the Japanese register included the badly damaged 32,700-ton *Nagato*, three damaged aircraft carriers and two damaged cruisers. Between Dec. 7, 1941 and Sept. 2, 1945, 318 Japanese combatant ships were sunk or crippled. This loss included 12 battleships, 15 aircraft carriers, 4 escort carriers, 15 heavy cruisers, 1 old heavy cruiser, 20 light cruisers, 126 destroyers and 125 submarines. Of this total 98 Japanese warships were sunk by surface craft, 91 by submarines, and 87 by aircraft. Of the Japanese submarines sunk, 26 were sunk by American submarines. The technique employed is a closely guarded secret. At the close of the war 24 destroyers were still afloat and 22 submarines, including 6 U-boats turned over to Japan by Germany.

The Australian Navy.—The Australian Navy consists of 3 heavy cruisers, the *Hobart*, *Shropshire* and *Australia*, one light cruiser, the *Adelaide*, 11 destroyers, several corvettes, 2 sloops, 19 fleet minesweepers and a few miscellaneous craft. During the war Australian warships sunk or probably sunk 27 German, Italian and Japanese submarines. Her losses include 3 cruisers, the *Canberra*, *Perth* and *Sydney*, 4 destroyers, 2 sloops and 1 minesweeper.

LOUIS H. BOLANDER,
Associate Librarian, U.S. Naval Academy.

NAVY RELIEF SOCIETY. Incorporated in 1904, under the laws of the District of Columbia, the Navy Relief Society was organized to relieve personal distress in the families of naval personnel where the source of support had been removed by death. In later years this assistance was broadened to include the families of active personnel, as well as the men themselves regardless of rank, rate, or length of service. The society is not a government agency. Its affairs are controlled by a board of managers, consisting of not more than 15 members serving terms of three years each.

The primary responsibility of the society is to provide aid in time of emergency need for the

dependent widows, orphans, and dependent mothers of missing and deceased naval personnel, which includes personnel of the Marine Corps and the Coast Guard while acting as a part of the navy in the time of war. Coast Guard Welfare, with funds provided by the Navy Relief Society, administers to the needs of the personnel in that service. In addition, the society helps the man to provide hospitalization, medical and surgical care for his dependents, and gives financial aid, in time of emergency need, to him and his dependents. Wherever possible, the society assists dependents in meeting and solving their problems by counsel and in other ways not involving financial expenditure, such as assisting them to obtain pensions, six-month gratuities, allotments and other benefits. The funds of the society come from voluntary contributions and from the proceeds of entertainments and benefits, usually arranged by naval personnel. Loans, without interest, are made to men and their dependents for emergencies and are repaid by voluntary allotments. Gratuities are given if the investigation shows that repayment will work an undue hardship on the family. For the six-month period ending June 30, 1945, assistance involving no financial expenditure was rendered by the Navy Relief Society in 48,755 cases. Gratuities amounting to \$617,470 were granted to 10,210 persons. Loans without interest were extended to 41,623 persons for a total of \$2,207,801. On June 30, 1945, a total of \$2,311,806 for 54,728 loans was carried forward.

Headquarters of the Navy Relief Society is located in Washington, D.C. There are 47 auxiliaries located at important navy yards and naval stations which are responsible for the work carried on within their respective areas.

R. M. BRAINARD,

Vice Admiral, United States Navy (Retired);
Executive Vice President, Navy Relief Society.

NAZIMOVA, Alla, American actress: b. Yalta, Crimea, Russia, June 4, 1879; d. Hollywood, Calif., July 13, 1945. For more than 45 years one of the most distinguished actresses of the stage and screen, Alla Nazimova was particularly famous for her interpretation of roles in Ibsen's dramas.

After attending school in Switzerland, Nazimova returned to Odessa to study violin at the Philharmonic Music Academy there. At the age of 17 she renounced music in favor of acting and left for Moscow to study with Konstantin Stanislavski, eventually graduating into the Moscow Art Theater. In 1904 she joined the Paul Orlenov Company which was renowned on the Continent and played every principal city in Europe. Nazimova took the leading roles in the dramatization of Dostoevsky's *Brothers Karamazov*, Chirikov's (Tchirikov) *The Chosen People*, and dramas by Tolstoy. The company went to New York in 1905 and, although she could not speak a word of English, her talents were quickly recognized by the drama critics. Signing a contract with the Schuberts in June 1906, she made a successful English-speaking debut on November 13 of that year as Hedda Tesman in Ibsen's *Hedda Gabler*. She then acted in many plays by Ibsen and Chekhov. Nazimova eventually went to Hollywood where she became one of the most popular stars of the silent screen. Among the films in which she appeared were *War Brides*, *Salome*, and *The Madonna of the Streets*. Despite her success, she was not enthusiastic about her motion picture roles and re-

turned to Broadway in 1928 to appear with Eva Le Gallienne's Civic Repertory Theater, giving one of her most outstanding performances as Mme. Ranevski in Chekhov's *The Cherry Orchard*. She later appeared in the Theater Guild productions of Turgenev's *A Month in the Country*, Eugene O'Neill's *Mourning Becomes Electra* (1931), and the dramatization of Pearl Buck's *The Good Earth* (1932), as well as in her own revivals of Ibsen's *Ghosts* (1935) and *Hedda Gabler* (1937). After a period of retirement, she returned to Hollywood and appeared in such films as *Escape*, *The Bridge of San Luis Rey*, *In Our Time*, and *Since You Went Away*. She became an American citizen in 1927.

NEBRASKA. West North Central state, United States; admitted to the Union March 1, 1867. Population (1940): rural, 801,686; urban, 514,148; total, 1,315,834. Land area, 76,653 square miles, divided into 93 counties. Chief cities, with 1940 populations: Omaha, 223,844; Lincoln, the capital, 81,984; Grand Island, 19,130; Hastings, 15,145.

Chief State Officers, 1945.—Governor, Dwight Griswold; lieutenant governor, Roy W. Johnson; secretary of state, Frank Marsh; treasurer, Carl G. Swanson; auditor, Ray C. Johnson; attorney general, Walter R. Johnson.

Judiciary.—Chief justice of the state supreme court, Robert G. Simmons; associate justices, E. B. Chappell, John W. Yeager, Adolph Wenke, Fred W. Messmore, Bayard H. Paine, Edward F. Carter.

Legislature.—The state legislature is a unicameral body of 40 members; it convenes biennially in odd years on the first Tuesday in January.

Education.—Public elementary schools (latest report, 1943-44 school year), 7,114; teachers, 9,227; pupils, 168,021; average yearly salary of elementary school teachers, \$991. Public high schools (1943-44), 644; teachers, 3,276; students, 69,528; average yearly salary of high school teachers, \$1,476. Teacher training is offered at a number of institutions in the state, including the University of Nebraska. Education courses are also offered in 162 high schools in the state. Schools receiving financial aid from the state: the University of Nebraska, and the four state teachers colleges at Peru, Chadron, Wayne, and Kearney. Education in Nebraska is compulsory for all children between the ages of 7 and 16, inclusive. Total receipts from state funds for elementary and secondary education in 1943-44, \$1,272,335.72; total receipts from cities and counties, \$23,236,536.98.

Finances.—Following is a statement of Nebraska's finances for the fiscal year 1943-44 (the last reported), furnished by Carl G. Swanson, state treasurer:

Balance in treasury, beginning of fiscal year 1943-44	\$16,328,467.85
Receipts, 1943-44	41,495,511.13
Total	\$57,823,978.98
Disbursements, 1943-44	39,754,057.22
Balance	\$18,069,921.76
Less transfer to postwar construction fund	3,000,000.00
Balance in treasury, beginning of fiscal year 1944-45	\$15,069,921.76

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.).....	115,032	329,855	265,298
Oats (1,000 bu.).....	42,078	35,586	74,522
Wheat (1,000 bu.).....	44,332	35,944	86,366
Barley (1,000 bu.).....	20,160	8,928	13,179
Rye (1,000 bu.).....	3,879	3,444	4,472
Sorghums for grain (1,000 bu.).....	1,786	2,244	1,344
Sugar beets (1,000 short tons).....	810	490	708
Hay:			
Alfalfa (1,000 tons).....	1,181	1,674	1,767
Tame (1,000 tons).....	1,497	2,028	2,020
Wild (1,000 tons).....	1,725	2,694	2,774
Beans, dry edible (1,000 bags).....	321	588	720
Potatoes (1,000 bu.).....	9,078	8,400	11,200
Grapes (tons).....	1,620	1,300	1,700

NECROLOGY, 1945. Following is a list of prominent persons who died in 1945. Biographies of many of the persons listed will be found in this volume in their alphabetical order.

Abdullah, Achmed (84), short story writer, novelist, playwright: d. New York City, May 12.

Albee, Fred H. (68), orthopedic surgeon, served with Byrd Antarctic Expedition of 1928: d. New York City, Feb. 15.

Alwin, Karl Oskar (54), conductor, Opera Nacional, Mexico City; former director, Vienna State Opera: d. Mexico City, Mexico, Oct. 15.

Appleton, Robert (80), retired head of Robert Appleton Publishing Company: d. North Andover, Mass., Jan. 19.

Arosemena, Florencio Harmodio (72), president of Panama, 1928-31: d. New York City, Aug. 30.

Asquith, Margot. See Oxford, Countess of.

Aston, Francis William (68), British chemist noted for work with isotopes; Nobel Prize winner in chemistry, 1922: d. London, England, Nov. 21.

Atwood, Rt. Rev. Julius Walter (85), retired Episcopal bishop of Arizona: d. Washington, D.C., April 10.

Baetjer, Edwin G. (77), noted Baltimore lawyer, director of numerous companies: d. Baltimore, Md., July 20.

Balfour, Gerald William (91), second earl of Balfour: d. Whittingehame, Scotland, Jan. 14.

Bartók, Béla (64), noted Hungarian composer, outstanding specialist in musical folklore: d. New York City, Sept. 26.

Bascom, Florence (82), American geologist: d. Williamstown, Mass., June 18.

Baxter, The Rev. Edward J. (37), dean, Fordham University School of Adult Education: d. New York City, May 26.

Becker, Carl L. (71), professor emeritus of history, Cornell University; author of *Progress and Power*, *Modern Democracy*, etc.: d. Ithaca, N.Y., April 10.

Beer-Hofmann, Richard (79), Viennese poet, playwright: d. New York City, Sept. 26.

Behrendt, Walter Curt (60), authority on city planning and housing; member of Dartmouth College faculty: d. Norwich, Vt., April 26.

Bell, Sir Charles Alfred (74), Canadian author, diplomat, formerly with Indian Civil Service: d. Victoria, B.C., Canada, March 8.

Bellmann, Henry (63), musician, educator, author of novel, *King's Row*: d. New York City, June 16.

Benavides, Oscar (69), ex-president of Peru: d. Lima, Peru, July 2.

Benchley, Robert C. (56), writer, actor, and humorist: d. New York City, Nov. 21.

Bendix, Vincent (62), inventor, founder of Bendix Aviation Corporation; president, Bendix Helicopters, Inc.: d. New York City, March 27.

Berry, Dr. Edward Wilber (70), palaeontologist; dean, Johns Hopkins University, 1929-42: d. Stonington, Conn., Sept. 20.

Berry, George Ricker (80), Semitic scholar, archaeologist; professor emeritus, Colgate-Rochester Divinity School: d. Cambridge, Mass., May 24.

Bertram, Adolf Cardinal (86), anti-Nazi archbishop of Breslau: d. announced Pilsen, Czechoslovakia, July 12.

Beven, John L. (57), president, Illinois Central Railroad: d. Clinton, Ill., Jan. 3.

Bibescu, Princess Elizabeth (48), British author, daughter of England's first earl of Oxford and Asquith; wife of Prince Antoine Bibescu of Rumania: d. Bucharest, Rumania, April 7.

Bong, Maj. Richard (24), American air ace who downed 40 Japanese aircraft; holder of 26 decorations, including Congressional Medal of Honor; killed testing jet propelled fighter plane, Burbank, Calif., Aug. 6.

Bose, Subhas Chandra (48), Indian political leader who headed Japanese puppet government in India; killed according to Tokyo reports, in airplane crash in Formosa, Aug. 19.

Bourdette, Edouard (57), playwright, manager of Comedie Française, 1936-40: d. Paris, France, Jan. 17.

Boynton, George Rufus (90), portrait painter, known as "the painter laureate of army and navy life": d. New York City, Jan. 6.

Brandeis, Mrs. Alice Goldmark (79), widow of Associate Justice Louis Dembitz Brandeis of U.S. Supreme Court: d. Washington, D.C., Oct. 11.

Brann, Maj. Gen. Donald W. (49), deputy commander, U.S. forces in Austria: d. Austrian Tyrol, Dec. 29.

Braun, Brig. Gen. Gustav J., assistant commander, U.S. 34th Infantry Division; shot down in observation plane south of Bologna, Italy, March 17.

Braun, Max (52), Saar anti-Nazi socialist leader, editor: d. London, England, July 3.

Brewster, Brig. Gen. David L. S. (57), U.S. Marine Corps veteran of both world wars: d. Bethesda, Md., July 10.

Briscoe, Commander Benjamin (78), U.S. Naval Reserve officer, retired; pioneer of automobile industry: d. near Dunnellon, Fla., June 26.

Bryan, Charles W. (78), former governor of Nebraska; vice presidential nominee of Democratic Party, 1924; brother of the late William Jennings Bryan: d. Lincoln, Nebr., March 4.

- Zuloaga, Ignazio (75), Spanish painter: d. Madrid, Spain, Oct. 31.

NEGRI SEMBILAN. See BRITISH MALAYA.

NEGRO ADVANCEMENT IN 1945. Many natural changes took place in the social relationships of people during the course of the Second World War; and despite the fact that these changes were inevitable, there was a reluctance on the part of many to accept them. Patriotism and the emotional appeal of an all-out effort to win the war muzzled any open attack on the greater recognition of American Negroes in our moral values—the exclusion of which has deprived them of a complete citizenship. But since the war ended, Negroes have experienced an increasing amount of opposition by whites.

The organized resistance to the Negroes has set up racial bars to better residential property; created greater hardships for the skilled worker to secure a job; blocked permanent federal legislation—and in the majority of states, to insure fair employment practices; encouraged white school children to go out on strikes as a demand for separate schools in the North; established a quota system in their admission to private and professional schools. And in the South there have been reports where the Constitution, guaranteeing life and liberty, has been flagrantly disregarded in cases involving Negroes. Local municipal ordinances have been enforced by operators of public transport systems with shameful abuse to Negroes. Often black soldiers in uniform have been subjected to humiliating treatment. And all of these citations have been high-lighted by Southern politicians—members of Congress—who trade in race hatred.

Therefore, it is difficult to look through a maze of conflict and discern the advancement of the Negro during the year, 1945. But there are some acts that point to a better trend in race relations—a prerequisite for understanding and accepting the Negro as a complete citizen. In many Southern communities, for the first time in history, blacks and whites have met in conferences to discuss racial issues. For instance, in the state of North Carolina, the governor, an editor of a daily newspaper and two distinguished Negro educators appeared in a national radio forum to discuss the inequalities in treatment of Negroes by public authority. Also a joint advisory committee on interracial affairs was organized by the Jackson (Mississippi) Chamber of Commerce and the Negro Chamber of Commerce. Among the nineteen vice presidents elected for this year to serve the Maryland-District of Columbia Industrial Union Council, five were Negroes.

The Association of American Colleges elected Dr. David D. Jones, president of Bennett College to its board of directors. A number of colleges and universities of the North have appointed Negroes to their academic faculties and professional staffs. Included in this list are Columbia University, New York University, the four city colleges of New York City, Smith College and Vassar. And on the board of trustees for the new Roosevelt College (Chicago) a Negro was elected vice chairman.

Another positive trend in the educational field was seen in the equalization of salaries of Negro teachers with that of whites in the state of South Carolina and in Newport News, Va., more than \$21,000 was paid to the Negro teachers as back salary following a court decision to equalize their pay with whites.

Of all professional fields, the theater has been far more democratic in acceptance of the

Negro; and during the year producers have presented them in non-Negro typed roles. *Anna Lucasta*, for example, a successful Broadway play, with an entirely Negro cast, and, without a Negro theme, is continuing indefinitely. Billy Rose's *Carmen Jones*, with an all-Negro cast, made a spectacular hit, and Lillian Smith's *Strange Fruit* began its run as a Broadway play.

Writing under this caption, "First Nights and Passing Judgments," in the October issue of *Esquire*, George Jean Nathan, one of America's foremost dramatic critics, said: "The Negroes have proved themselves and have fully deserved their estate. And the first peculiarly to agree are the very whites who are in danger of being ultimately ousted by them. It was these whites, for example, who on a committee composed of actors, producers, and critics of their own race at the end of last season awarded the Derwent prize for the best performance of a supporting player not to a white actor, but to a Negro, Frederick O'Neal. It was ten out of sixteen of these white reviewers who again subsequently singled out from white actors for highest respect in that same category, that same Negro actor and who further endorsed Alice Childress, a Negro actress, above such white actresses as Catherine Proctor, Dora Meranda and Catherine Willard; and Hilda Simms, the Negro actress above such whites as Carol Stone, Mary Welch and others."

Other Negro performers on Broadway included Paul Robeson in *Othello*, Canada Lee in *The Tempest*, Richard Huey and Dooley Wilson in *Bloomer Girl*. Broadway had already been introduced to Todd Duncan, Georgetta Harvey and Butterfly McQueen. And now new names are to be added like Muriel Smith, Carotta Franzell, Elton Warren, Inez Mathews, Luther Saxon and Muriel Rahn.

In other professions, too, individual Negroes have gained some distinction. Dr. U. G. Dailey, a Chicago surgeon, was elected to an active fellowship in the International College of Surgeons. Dr. Dailey, Dr. Roscoe C. Giles, and Dr. Carl G. Roberts were the first Negro surgeons elected to the American College of Surgeons in over 20 years. A political scientist, Dr. Ralph J. Bunche, was appointed by President Truman as a member of the Anglo-American Caribbean Commission. Irving C. Mollison, a Chicago lawyer, was appointed to the United States Custom Court, New York District. Adam Clayton Powell, Jr. was the first Negro to sit in Congress from the State of New York. Clifford F. Smith, an ex-seabee, the first Negro permitted to take the examination for the master electrician's license in Houston, Texas, successfully passed. For the first time in history, a Negro, Dr. Channing Tobias, was elected as the executive director of a nonracial foundation—the Phelps-Stokes Fund.

In the general field of law and order Georgia abolished its poll tax law; New York State enacted the Ives-Quinn bill which outlaws discrimination in employment because of "race, creed, color, or national origin;" the New Jersey Assembly established a Division against Discrimination in the State Department of Education. The State Supreme Court of California, in the case of the Boilermakers Union, ruled that a labor union, in the exercise of a quasi-public function, cannot exclude Negroes from its membership while attempting to enforce a closed shop agreement. And the Supreme Court of Florida freed a Negro, sentenced to 20 years in prison for killing a white sheriff, who had attacked him after

searching his home. The court commented that although the accused was a Negro and the victim a white man "these facts should make no difference in rules and principles applicable to the administration of justice."

For the federal government the Navy Department gave the greatest recognition to the Negro. Through its Bureau of Naval Personnel the department issued a guide to its commanding officers which abolished its policy of discrimination against Negro seamen. According to the Navy Department there were proportionally more Negroes in the Revolutionary navy than in the army of that time. This held true until the War of 1812. It was not until the Second World War, however, that they were again admitted in large numbers for general service. The order to the command of Negro personnel clearly illustrated that: "The Navy accepts no theories of racial differences in inborn ability, but expects that every man wearing its uniform be trained and used in accordance with his maximum individual capacity determined on this basis of individual performance." And in the Second World War—in spite of many disadvantages—for the first time Negro sailors were commissioned as officers; for the first time, too, in its 176-year history, Negroes were admitted to the U. S. Marine Corps; women were taken into the Waves and Spars; sailors were sent to specialists' schools to learn skilled trades; a Negro was given command of a mixed crew on a patrol vessel; nurses were taken into the navy, and men were taken in all capacities without quotas.

Although the army has been much less aggressive than the navy in eliminating discrimination, this must be mentioned for the record: Negro soldiers for the first time were assigned to white combat units at the fighting front, admitted to the Army Air Corps, women taken into the Women's Army Corps, a Negro commissioned a general, officer candidates trained and lived in the same barracks with whites, reporters accredited as war correspondents, and nurses integrated with whites and attended white patients.

In spite of these hopeful trends, one must consider them as only fragmentary gains in an unsettled world—groping for peace. The state of war can no longer be used as a catalyzing agent for democracy, and the position of the Negro now rests in a crucial state.

NEJD. See ARABIA—Saudi Arabia.

NEPAL. An independent kingdom on the northeastern frontier of India. The area is 54,000 square miles, and the population numbers 5,600,000. Gurkhas are the dominant race. Since 1867 authority has been vested in the prime minister (always a member of the royal family) not in the sovereign. Maharajadhiraja Tribhubana Bir Bikram has been the sovereign since 1911; and Sir Joodha Shumshere Jung Bahadur Rana, the prime minister since 1932. Nepal's internal and external independence has been recognized by the British government. A British minister resides at the royal court, and a Nepalese minister is in London. Revenue, over £1,000,000 a year, is derived from taxes on land, from forest produce, and from the customs. The capital is Katmandu (pop. 108,805), and other large towns are Patan (104,928) and Bhatgaon (93,176). Exports (about £4,000,000 yearly) include cattle, hides and skins, jute, grains, oil seeds, and lumber; and chief imports (some £2,000,000 a year) are salt,

spices, sugar, metal ware, cotton goods, and yarn. Nepal has two rail connections with the British Indian rail system in Bihar Province; from Amlekhganj to Raxaul, 25 miles; and from Bijulpura to Jayauagar, 33 miles. Numbers of Gurkhas are recruited from Nepal for the Indian Army; and a separate Nepalese military force served in the Second World War.

NETHERLANDS, The, or HOLLAND. A country of northwestern Europe which was under German occupation from May 15, 1940 to May 5, 1945; area 13,440 square miles, population (Jan. 1, 1943) estimated at 9,090,000. The kingdom of the Netherlands was established in 1814 by the Treaty of London, under the sovereignty of a prince of Orange-Nassau, a descendant of the house which had taken a leading part in the affairs of the country since the 16th century. According to the constitution, it is an hereditary constitutional monarchy, with executive power vested in the sovereign and legislative authority in the sovereign and a Parliament of two houses, known as the States-General. For administrative purposes, the country is divided into 11 provinces. The principal towns are Amsterdam (est. pop., Dec. 31, 1939, 800,594), Rotterdam (619,686), The Hague (504,264), Utrecht (165,028), Haarlem (140,469), Groningen (121,632), and Eindhoven (113,128).

On May 10, 1940, German land and air forces invaded the Netherlands without declaring war. Within three days the country had been cut in two as the German armies moved toward the Channel ports. Queen Wilhelmina, who succeeded at the age of 10 on the death of her father in 1890, and ascended the throne on Sept. 6, 1898, moved to London and there headed the government. On May 14, 1940 the Dutch forces gave up fighting except in the province of Zeeland, and on the following day the Netherlands was completely occupied by the Germans. Dr. Artur Seyss-Inquart was appointed Nazi civil administrator by German officials on May 30, 1940.

Heroic resistance and sabotage led by an active underground movement developed. Late in January 1944 it was reported that 20,000 Dutch citizens had been executed for patriotic activities by occupationist Nazi forces between May 1940 and December 1943, but without decreasing sabotage. Following the Allied landing in France on June 6, 1944 the British entered the Netherlands on September 11 above Neerpelt, Belgium, after crossing the Schelde-Meuse Canal, and on October 31 reached the Meuse River. On November 6 it was announced that the Germans had begun their retreat north of the Meuse.

Considerable sections of the Netherlands were flooded by the retreating Nazi troops, who opened dykes, and it was feared that the ensuing devastation would affect the economy of the country for years to come. By the middle of November, 17 per cent of the arable land was under water, an acute shortage of food had developed, and famine threatened the country. A general demand arose in the liberated areas for punishment of all traitors, for the re-establishment of civil liberties, and for an early restoration of representative government.

Military Forces.—Prior to May 1940, military service was compulsory and partly voluntary, with liability to service with the army between the ages of 19 and 40. The navy consisted of 1 coast-defense vessel, 5 cruisers, 5 armored gunboats, 3 escort vessels, 8 destroyers, 6 seagoing torpedo boats, 24 submarines, 9 minelayers, 16

minesweepers, and other smaller craft, all together totaling 120 naval units. The Netherlands held a leading position in the naval strength of the occupied countries opposing the Axis with 80 combatant ships and approximately 7,000 personnel on March 31, 1943.

The Netherlands armies had an estimated personnel of about 500,000, including all available actives and trained reserves in the latter part of 1939; the air force numbered about 600.

During the German occupation the Netherlands army was demobilized, and the country was "policed" by German troops, under conditions of growing opposition from the effective resistance movement, with almost universal support by the general population.

Finances.—On May 7, 1940, the consolidated debt totaled 3,140,000,000 guilders, and the floating debt 776,000,000 guilders. On June 4, 1945, these figures had risen to about 6,000,000,000 and 6,671,000,000 respectively. The item "Foreign Bills" increased in the same period from 1,000,000 to 4,500,000,000 guilders. The circulation increased from 1,000,000 to 5,500,000,000. Circulation of the bank notes of smaller denominations increased from 1,000,000 guilders to 313,000,000 guilders. Current accounts at banks and in post offices amounted to an estimated total of 3,800,000,000 guilders, of which 778,000,000 guilders were liabilities of the Netherlands Bank. (In July 1945 notes of 100 guilders or less, while not being marketed commercially in New York, were being redeemed by the Netherlands Bank in Holland at the rate of \$37.38 in United States dollars per 100 guilders.)

Production, Foreign Trade, Communications, and Education.—Owing to the disruption caused by the German occupation, complete current statistics on these subjects were not available at the time of going to press. The few published facts indicate some of the chief postwar problems confronting the Netherlands. After September 1944, when the Dutch began a nationwide strike against the Germans, the latter cut off food imports into Holland and stopped the shipment of food from the agricultural districts of that country to the large cities. As a result, during the months preceding the liberation the daily food allotment of the Dutch dropped from the normal 2,500 to 3,000 calories to 500 calories or less. Thousands starved to death, and some 80,000 persons required the use of special proteins, rushed by air from the United States and Britain, to keep them alive.

Food, clothing, medical supplies, and fuel for the coming winter became the supreme immediate necessities. Toward the end of June it was estimated that the total damage due to the war amounted to over 15,000,000,000 guilders, equivalent to half the national wealth in 1938. Even these figures do not take into account losses of property removed by the Germans, 50 per cent damage to railways, and between 10 and 20 per cent destruction of buildings, public utilities, and agriculture (by flooding with salt water, etc.). In Rotterdam, during the invasion and the bombing which followed the surrender, the Germans destroyed 26,000 houses, 1,200 factories, and 2,300 shops.

Principal Events, 1945.—At the start of the year, more than one half of Holland, with a little more than three quarters of the population, was still in German hands. The Allied armies' dash to the Rhine, in the fall of 1944, had brought liberation only to the southern provinces of Limbourg, Brabant, and Zeeland, leaving the Nazis in control

of the whole central and northern portion of the country, including all the biggest urban centers. Military operations in the early part of 1945 did not materially alter the stalemate on the Rhine and Maas (Meuse) rivers which had resulted from the Battle of Arnhem. Thus, for a majority of Hollanders, freedom did not ring until the total collapse of Germany. Late in April, Canadian forces, surging back into Holland from occupied Germany liberated the northeastern provinces, but the great cities of Amsterdam, Rotterdam, The Hague, and Utrecht had to wait until May 4, when all German forces in Holland surrendered unconditionally; four days later, the Canadians were in complete control of the country. On May 11 the Netherlands Civil Affairs Administration announced an extraordinary state of siege under which Gen. H. D. G. Crerar, commander of the Canadian First Army, was given "the highest power in the land." This military phase of Holland's rehabilitation lasted until September 7, when the state of siege was lifted. By that time most administrative functions had been returned to the Netherlands government, but the work of the Civil Affairs Administration continued on a limited scale.

Queen Wilhelmina arrived in southern Holland on May 3 but did not return to the royal palace at The Hague until July 6. Premier Pieter S. Gerbrandy's government-in-exile, which had remained in London even after the partial liberation of Holland in the fall of 1944, resigned on May 16 but continued to function at the queen's request and on May 23 the Cabinet convened at The Hague for its first meeting on liberated Dutch soil. A new government, headed by the 50-year-old resistance leader Professor Willem Schermerhorn, was formed on June 23 with the active assistance of the Socialist leader Willem Drees. All but four of the Cabinet's 15 members were men of the former underground and they represented all major political parties with the exception of the Communists and the Protestant anti-Revolutionary Party. Foreign Minister Eelco Nicolaas van Kleffens was continued in his post which he had held since August 1939.

Despite public clamor for early elections, the new government decided that elections on a national scale, for the lower house of Parliament, should be postponed until the latter half of 1946 on the grounds that voting registers were in a chaotic condition and that the press and political parties needed time for reorganization. Municipal and provincial elections were scheduled for early 1946.

Within a few days after liberation, more than 3,000 persons had been arrested by the Netherlands Forces of the Interior, in collaboration with Allied authorities; the total later reached 60,000. Artur Seyss-Inquart, the Nazi Reichskommissar for occupied Holland, was seized by Canadian military police while attempting to escape on May 6; he was turned over to the international tribunal at Nürnberg for trial as a war criminal. Anton Mussert, the diminutive leader of the Dutch Nazi Party, also was taken into custody, along with his chief henchmen, Meinoud M. Rost van Tonningen and Max Blokzijl. Rost van Tonningen, who had been president of the Netherlands Bank under the Nazi regime, later committed suicide; Blokzijl, chief radio propagandist of the Dutch Nazis, was sentenced to death in September; Mussert went on trial November 27 before a special court at The Hague, which condemned him to death on December 12. According to a statement made by Premier Scher-

merhorn on September 10, the government plans eventually to deport 80,000 Dutch traitors and collaborationists to one of Holland's overseas possessions for forced settlement; all the more serious offenders would have to stand trial, though.

Good progress was made in the summer and fall of 1945 toward the rehabilitation of Holland's ruined economic system and the improvement of food and health conditions. As in other liberated countries, the chief prerequisite for national recovery was fuel. By early September, the consumption of coal had reached 60 per cent of normal, and transport facilities were improving rapidly. The reclamation of land flooded by the Germans also proceeded satisfactorily. But the housing situation remained acute throughout the year.

A vast improvement in the food situation was noted within a few weeks after liberation. At the turn of the year, famine conditions had prevailed in all the large cities; in February, the daily food ration per head dropped below 400 calories in the thickly populated "hunger provinces" of western Holland. Relief did not come until a few days before the German surrender, when British and American mercy planes and trucks were permitted to cross the fighting lines to carry supplies to the starving civilian population. Substantial shipments of food were rushed into Holland immediately after the war in Europe and by mid-July the situation was described as satisfactory by nutrition authorities, with the average consumption per day and person at 2,000 calories. By the end of August conditions had improved so much that community kitchens in Amsterdam and The Hague could be closed.

Despite the hardships suffered by the homeland in five years of occupation, the Netherlands government vigorously prosecuted the war in the Pacific. On June 1, Gen. Henri G. Winkelman, commander of Dutch forces at the time of the Nazi invasion, who had been released from a German concentration camp on May 19, issued a call to Holland's youth to volunteer for service in the Far East. Jonkheer A. W. L. Tjarda van Starkenborgh Stachouwer, governor general of the Netherlands East Indies, was liberated from a Japanese prison camp on August 19. On the same day the "cease fire" order was issued to Japanese forces on Java. The Dutch government, which had been taken somewhat by surprise by the sudden Japanese collapse, took quick steps for the rehabilitation of the East Indies and their return to Netherlands control. It was unable, however, to quell a nationalist revolt, headed by Achmed Soekarno, which led to the establishment of an "Indonesian Republic," unrecognized by any Allied power. Bloody clashes occurred on Java, and on a minor scale on Sumatra, between the Indonesians and British and Dutch forces. Van Starkenborgh Stachouwer resigned October 15 and was replaced as governor by Hubertus J. van Mook. On November 13, "President" Soekarno named Sutan Sjahrir "Premier" of the "Indonesian Republic." Both Britain and the United States strongly urged the Dutch and the native leaders to compromise and at the year's end, a peaceful solution seemed near.

NETHERLANDS BORNEO. See BORNEO; NETHERLANDS INDIES.

NETHERLANDS GUIANA. See SURINAM.

NETHERLANDS INDIES (MALAY ARCHIPELAGO, INDONESIAN ARCHIPELAGO). Overseas territories

of the Netherlands (Holland) in the East Indies, consisting of five large islands—Java, Sumatra, part of Borneo, Celebes, and the western half of New Guinea, also some 15 minor but important islands, and literally thousands of small islands and islets. The area and population (1930 census) are as follows:

Island	Area sq. mi.	Population 1930
Java and Madura.....	51,032.4	41,718,364
Sumatra	164,147.6	7,677,826
Riouw-Lingga Archipelago ..	12,234.9	298,225
Bangka	4,610.7	205,363
Billiton	1,866.1	73,429
Borneo, Dutch	208,285.5	2,168,661
Celebes	72,986.4	4,231,906
Molucca ¹	191,681.8	893,400
Timor Archipelago	24,449.5	1,657,376
Bali and Lombok	3,973.0	1,802,683
Total	795,267.9	60,727,233

¹ Including Dutch New Guinea.

Among these territories, Java, with an area roughly comparable to that of the state of New York, and with its amazingly dense population (about 817.5 per square mile), has been economically and politically the most important island of the Netherlands Indies. Forming with Madura (Madoëra) the part of the territory under direct government (as compared with the remainder, known as the outer provinces), it includes, toward the northeast end of the island, Batavia (pop. 435,184), chief city of the Indies and seat of the government. Java and Sumatra have extensive, remarkably fertile flatlands, which account largely for their immense productivity and enormous population. Sumatra shares importance with Borneo among the great petroleum regions. Borneo, (q.v.) the world's third largest island, is only partly under Dutch sovereignty, the northern part, comprising British North Borneo, and Sarawak. Its oil deposits, forest products, and minerals were crucial to Japan's war effort. Over half the island of Timor (mainly the eastern end) is Portuguese. Dutch New Guinea, constituting the western half of the world's second largest island, was the only section of the Netherlands Indies, part of which remained in Allied possession throughout the Japanese occupation.

Important cities of the Netherlands Indies other than Batavia are: Soerabaja (Surabaya, pop., 1939, 341,675), Semarang (217,796), and Bandoeng (Bandung, 166,815), all on Java; Palembang (108,145), and Medan (76,584) on Sumatra; Makassar (Macassar, 84,855), and Manado (27,482), on Celebes; and Bandjermasin (65,698) and Balikpapan, (strategic oil center, est. pop. 30,000, in 1941), on Borneo.

The People.—The native inhabitants of the Netherlands Indies (numbering in 1930 some 59,000,000), speak about 60 languages, Javanese, Sundanese, and Madurese being used by the greatest numbers. Malay is also understood in most of the islands. Among the other principal native peoples are: the Achinese of Sumatra, the Menadonese of Celebes, the Sasaks of Lombok, the Dyaks of Borneo, and the Papuans of New Guinea. There were also in 1930, 240,417 Europeans, 1,233,214 Chinese, and 115,535 other orientals. During the Japanese occupation the invaders tried to popularize the use of the Japanese language as well as to secure acceptance of Japanese leadership in the establishment of the southeast Asia co-prosperity sphere—projects said to have been met with considerable resistance and hostility on the part of the Indonesians.

Agriculture and Production.—The Netherlands East Indies constitute an exceedingly wealthy

colonial possession. "In 1939," states *Foreign Commerce* (Sept. 16, 1944) "the Indies supplied an estimated 86 per cent of the total world pepper exports, 65 per cent of kapok, 37 per cent of rubber, 33 per cent of sisal hemp, 27 per cent of coconut products, 24 per cent of palm-oil products, 19 per cent of tea, and 5 per cent of coffee. Moreover, in the same year 92 per cent of the world's production of cinchona bark for extraction of quinine was furnished by the Netherlands Indies, 19 per cent of tin, 7 per cent of bauxite for aluminum, 6 per cent of sugar cane, and 3 per cent of petroleum." More than 130,000,000 pounds of tea were gathered in 1939 from the hillsides of Java. Sumatra oilfields in 1940 produced nearly 40,000,000 barrels of crude petroleum. Three small islands, Banka, Billiton, and Sinkep, supplied about 44,000 tons of tin annually before the Second World War. In 1940 production of sugar amounted to 1,587,364 metric tons; of coffee, 77,647 tons; of rubber, 546,021 tons; of tobacco, 27,414 tons.

The Japanese, during the years of their occupation, are understood to have converted large areas in Java from tea and coffee production to cotton, most of which went to the army and the home islands. They also caused severe damage to Java's extensive forests, in a vain effort to make good their shipping losses through the use of wooden vessels. Owing to lack of refining facilities, the occupying forces were unable to make use of much of the archipelago's annual yield of 58,000,000 barrels of petroleum. In February 1945, the Netherlands government, anticipating the end of the Japanese occupation of the Indies, which was to come some months later, were planning to obtain in the United States goods valued at more than \$200,000,000 for relief and rehabilitation in the Netherlands Indies, including 200,000 tons of essential cereals, 80,000 tons of meat and fish, and some 450,000,000 yards of cotton goods. These huge emergency imports to the Indies—which also included rubber-processing equipment valued at \$15,000,000—were expected by the Netherlands authorities to yield quick returns in valuable exports—rubber, coffee (from Java), tea, sugar, tobacco (from Sumatra), kapok, palm oil, pepper, nutmegs, cloves, and cinnamon. It was hoped that the islands would thus be enabled to repay the credits extended to them, and to restore their own depleted and disordered economy. In July (1945) it was reported that as an outcome of the two-way lend-lease agreement between the Netherlands and the United States, petroleum was being obtained by the United States military authorities from the island of Tarakan, then recently liberated, and also from the Brunei area of Borneo.

Foreign Trade.—Exports in 1940 were valued at 883,239,000 guilders and imports at 437,678,000 guilders as compared with exports valued at 787,079,000 guilders and imports valued at 529,868,000 guilders in 1939. In 1940 the United States supplied 290,907,000 guilders worth of the imports and took 102,783,000 guilders worth of the exports of the islands. (The guilder averaged \$0.53 in U.S. money in both 1940 and 1939. In July, 1945, notes of 100 guilders or less were being redeemed by the Netherlands Bank in Holland at the rate of \$0.3738 per guilder in United States currency.)

Communications.—On Dec. 31, 1940, the Netherlands Indies had about 43,700 miles of highways—the mileage of the larger islands being: Java and Madura, 16,850; Sumatra, 15,800; Bor-

neo, 2,250; Celebes, 5,090; Bali and Lombok, 1,250; Timor, 2,100; and the Moluccas, 250. There were 4,611 miles of railways and tramways (state and privately owned) of which 3,378 miles were in Java and 1,233 miles in Sumatra. There were 676 post offices; 1,380 rural postal agencies; 481 telegraph offices; 629 rural telegraph agencies; and 85 radio stations. There were also 722 telegraph offices and 44 radio stations of other government services and private companies. Government telephone lines extended in 1940 over 16,921 miles, and government cables over 1,479 miles. There were 340 government telephone exchanges and 51,606 telephones. There was regular airplane service supplied by three separate companies.

On March 16, 1945, the first of 20, 450-ton coastal vessels ordered by the government of the Netherlands Indies was begun at Portland, Oregon. These ships, which were to be finished before the end of the year, were intended first to carry war equipment and food to the liberated areas in the archipelago, and later to aid in the rehabilitation of the islands.

Government.—For nearly two centuries before the period of Japanese occupation (1942–45) the Netherlands Indies had been ruled by the Dutch East India Company, which was created in 1602. The company was dissolved in 1798, and from 1816 on the Netherlands possessions were ruled by the mother country. Administrative and executive authority rests in the hands of a governor general, who is assisted by an advisory council of from four to six members. Both the governor general and the members of the council are appointed and dismissed by the queen. In 1918 a Volksraad (Peoples Council) was set up to discuss the budget, and to advise the government on matters of general importance. The majority of the members of the People's Council are Indonesians, but it includes also Europeans, Chinese, and Arabs. Indonesians are eligible for public offices, and steps have been taken to develop self-government. Java and Madura have been divided into three autonomous provinces under governors, and subdivided into residences, governed by residents. Local government is exercised almost entirely by native civil servants. Governors likewise were appointed for the native states of Soerakarta and Djokjakarta, and the outer islands have been divided into three areas under governors, and subdivided into 17 residencies, governed by residents.

Finance.—During 1942, 750,918,773 guilders were the estimated amount of government revenues, as compared with 746,149,905 guilders in 1941. Expenditure in 1942 was estimated at 813,802,815 guilders as compared with 1,060,168,910 guilders in 1941. To meet these deficits a number of taxes and levies were increased and new ones introduced.

On Feb. 21, 1944, a new banking institution, De Bank voor Nederlandsch Indie, N.V. (The Bank for the Netherlands Indies, Ltd.) was incorporated in London. It was described as a temporary institution to begin operations when the governor of Surinam so willed, and to terminate on Dec. 31, 1948, unless conditions necessitated an earlier closing or an extension. The object of the new company was to re-establish banking and financial operations generally in the Netherlands Indies between liberation and the restoration of normal conditions.

Following the liberation of Balikpapan early in July 1945, new Netherlands Indies bank

notes, printed in the United States, were put in circulation, superseding the inflationary Japanese invasion currency, and the prewar Indies currency. The latter, while it had retained its former value, now had to be exchanged for the new notes, which now became the sole legal tender.

Religion and Education.—Under the Dutch regime religious liberty was granted to all faiths. The majority of the natives are Mohammedans, but there are one and a half million Hindus on Bali and Lombok, several million Animists in the outer Territories (Sumatra, Borneo, Celebes, etc.), 1,600,000 Protestants, mostly organized in various native churches and 500,000 Catholics.

Education was offered by means of public primary schools for Europeans and persons assimilated with them, for the Chinese (Dutch-Chinese schools), for the natives (Dutch-Native schools), and link schools. Instruction in these schools was through the medium of the Dutch language. In addition, there were public schools in which the instruction was given through the medium of a native tongue. For secondary education there were public secondary schools. Higher education was given at the Technical College at Bandoeng and in the colleges of law, medicine, literature (since 1940), and civil service at Batavia. There were a number of private schools, primary and secondary, and training schools in engineering, architecture, electrical engineering, mining, and agriculture.

Principal Events.—Apart from circumstances of economic or political interest already mentioned, the outstanding events of late 1944 and the first half of 1945 had to do with the Allied military campaign to cripple Japan's war effort by cutting off the flow of essential war supplies from the Netherlands Indies to the Japanese home islands, and to drive the enemy from the Indonesian Archipelago. To these ends, ever-intensifying air and naval raids were carried on against Japanese-controlled oilfields, airfields, and other concentration points, and shipping. On May 1, after heavy bombing preparation, Tarakan Island, off the northeast coast of Borneo, was invaded by Australian forces in conjunction with Netherlands engineering troops. Resistance on Tarakan ended on June 11. By June 27 Tarakan oilfields resumed production, now under Allied auspices. In the meantime a second invasion was opened on June 10 on Brunei Bay, on the northwest coast of Borneo. On July 1 Allied forces landed at Balikpapan, east coast oil center, capturing the docks and oil facilities on July 3, securing the immediate area by July 5, and thence extended control north and south along the coast. Bombing, and some naval bombardment of strategic objectives continued until August 14, when general offensive action was halted throughout the Pacific area following the announcement of the Japanese surrender.

The Japanese in Netherlands Borneo formally surrendered (to the Australians) on September 19. On October 4 it was reported that Indonesian nationalists, having proclaimed an Indonesian republic, had taken over the chief cities of Java. The Dutch declared their willingness to negotiate with Indonesian leaders other than Dr. Achmed Soekarno, most prominent figure in the movement, whom they accused of having collaborated with the Japanese, but proceeded, with British assistance, in their attempt to reoccupy the island. The Nationalist leaders, reaffirming the desire of the Indonesians for full independence, rejected Dutch proposals to give

the islands dominion status in a projected commonwealth under Netherlands auspices. By December 9, after severe fighting, British naval, air, and ground forces (the latter mainly Indian divisions) had established military control or some of the main Javanese centers. On December 20 the United States government asked for an early end of the fighting, and for a settlement along the liberal lines called for in the United Nations Charter. By January 4, 1946, the Indonesian civil police had been disbanded, 2,000 Dutch marines landed at Batavia, the capital, and the civilian functions of military law transferred by the British to the Netherlands military courts.

NETHERLANDS WEST INDIES. See CURAÇAO; SURINAM.

NEVADA. Mountain state, United States; admitted to the Union Oct. 31, 1864. Population (1940): rural, 66,956; urban, 43,291; total, 110,247. Land area, 109,802 square miles, divided into 17 counties. Principal cities, with 1940 populations: Reno, 21,317; Las Vegas, 8,422; Carson City, the capital, 2,478.

Chief State Officers, 1945.—Acting governor, Vail Pittman¹; secretary of state, Malcolm McEachin; treasurer, Dan W. Franks; comptroller, Henry C. Schmidt; attorney general, Alan Bible.

Judiciary.—Chief justice of the state Supreme Court, E. J. L. Taber; associate justices, Edward A. Ducker, William E. Orr.

Legislature.—The state legislature (Senate, 17 members; Assembly, 40) convenes biennially in odd years on the third Monday in January.

Education.—Public elementary schools (1944-45), 211; teachers, 652; pupils, 21,170; average yearly salary of elementary school teachers, \$1,638. Public junior and senior high schools, 5; teachers, 86. Teachers train at the University of Nevada, Reno, which receives financial aid from the state. Total state appropriation for education (1945), \$869,445; appropriation by cities and counties (1943-44), \$2,196,942. Superintendent of public instruction, Mildred Bray.

Finances.—Following is a statement of Nevada's finances for the fiscal year 1944-45, supplied by Dan W. Franks, state treasurer:

Balance in treasury, beginning of fiscal year 1944-45	\$ 3,995,669.36
Receipts, 1944-45	7,267,522.91
Total	\$11,263,192.27
Disbursements, 1944-45	6,844,145.45
Balance, beginning of fiscal year 1945-46	\$ 4,419,046.82
Less outstanding treasurer's checks per controller's record	584,791.30
Treasurer's balance, June 30, 1945	\$ 3,834,255.52

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Oats (1,000 bu.)....	181	252	287
Wheat (1,000 bu.)..	441	479	509
Barley (1,000 bu.)..	507	851	912
Hay:			
Alfalfa (1,000 tons)	301	337	323
Tame (1,000 tons)	365	426	403
Wild (1,000 tons)..	211	230	230
Potatoes (1,000 bu.)	409	544	684

NEVIS. See LEEWARD ISLANDS.

NEW BRITAIN. See NEW GUINEA, TERRITORY OF.

¹E. P. Carville resigned the governorship July 24, 1945 to become member of the United States Senate.

NEW BRUNSWICK. One of the three Maritime provinces of Canada; area, 27,985 square miles; population (1941) 457,401. The province was separated from Nova Scotia in 1784 under the first governor, Thomas Carleton. It is represented in the Canadian Parliament by 10 senators and 10 members of the House of Commons. Provincial government is administered by a lieutenant governor and a Legislative Assembly of 48 members elected for five years. Fredericton, the capital, has a population of 10,062. Other cities are Saint John (51,741), and Moncton (22,763).

Finances.—Revenues for 1945 were estimated at \$13,072,567 and expenditures at \$13,034,838. The bonded debt of the province at the end of 1944 was \$103,630,073.24.

Education.—Primary education is nondenominational, compulsory and free. For the school term ended June 30, 1944, 2,706 classrooms were in use in 1,604 school buildings in the province. Enrollment in graded schools was 49,213 and in ungraded schools 31,677. Degree-conferring institutions are the University of New Brunswick, under provincial control at Fredericton; Mount Allison University at Sackville; St. Joseph's University at Memramcook; St. Thomas College at Chatham; and the Sacred Heart College at Bathurst.

Production.—Agricultural production in 1944 included: potatoes 10,369,000 hundredweight. Livestock included 232,400 cattle, 111,300 sheep, and 1,792,000 poultry, all substantial increases over the preceding year. For 1945, to meet emergency demands for increased food production, there was an above average acreage of grain and potatoes.

Of New Brunswick's 27,985 square miles (total area) approximately 80 per cent, or about 14,000,000 acres, is productive forest land. The province retains the title to and administers 7,500,000 acres of forest.

Capital invested in the pulp and paper, saw-mill and wood processing industries is estimated at \$50,000,000 and wages approximate \$16,000,000 annually. Total value of forest products in 1944 was estimated at \$72,000,000. The total production of sawn lumber in 1944 accounted for some 315,000,000 board feet and the value of products reached \$37,000,000. In 1944 the six pulp and paper mills in New Brunswick used 827,000 cords of pulpwood operating at about 90 per cent of capacity. The value of the products of the six plants is estimated at \$35,000,000.

Mineral production in 1944 was valued at \$3,269,000. There were 6,500,000 cubic feet of natural gas and 784,000 gallons of crude oil produced near Moncton. It is believed by some geologists who have done exploratory work in this field that it may be developed into one of the greatest oil producers on the continent when modern drilling methods are applied. More than 52,000 tons of gypsum were produced and processed in Albert County. Some 71,000 tons of limestone were quarried, of which 62,000 were used for soil treatment. Peat moss operations are continuing in Gloucester County, where some of the continent's richest deposits of peat are found. Bituminous coal is mined in the Minto-Chipman area. Gold, iron, copper, lead, zinc, antimony, and manganese exist in the province but so far have not been found in commercially profitable quantities.

There were 867 manufacturing establishments in 1942 with capital of \$105,056,835, employing

22,182 persons and producing goods valued at \$123,839,475.

Transportation.—New Brunswick is well served by the Canadian National Railways system, the main route from Quebec Province following the north shore to Moncton, with an inland route from Edmundston to Moncton. The Canadian Pacific operates daily service between Montreal and Saint John and Fredericton. The Second World War saw the inauguration in New Brunswick of a great air traffic, and the establishment of numerous fine airports including the airport at Moncton, one of the largest in the world. The Trans-Canada Airways system was established on a regular schedule between Montreal and Moncton on Jan. 1, 1940, and is now extended to include Halifax, Sydney, and Newfoundland. Northeast Airlines link Moncton to Boston with direct daily connections for New York and Washington; and Maritime Central Airways makes several round trips daily between Moncton and points in Prince Edward Island. Because of its geographical situation, New Brunswick's civil air traffic far exceeds that of the other Maritime provinces. The New Brunswick highway system embraces 12,000 miles of roads of which more than 1,000 miles are paved. The government's postwar plans include further paving.

Hunting and Angling.—The extensive forests and waterways of New Brunswick give cover for an abundance of game and fish. Each year shows an increase in the number of nonresident hunting and angling licenses sold, and in spite of numerous wartime restrictions on travel and ammunition, the year 1944 was second only to 1941 in the sale of both nonresident hunting and angling licenses.

Fisheries.—New Brunswick with 600 miles of coastline bordering those great seas of fish, Fundy Bay and the Gulf of St. Lawrence, has a rich annual harvest of sea fish and shellfish. The best-watered country of its size in the world, drained by a network of great rivers and dotted with lakes and streams, this province also has a valuable inland fishery. The value of production of the fisheries of New Brunswick in 1943, the last year for which figures are available, amounted to \$11,202,489 compared with \$7,132,420 in the previous year. The sardine fishery was valued at \$2,990,490 an increase of 40 per cent in value over that of the preceding year. In New Brunswick, the sardine fishery is of first importance, the lobster fishery second, and the herring fishery, third. Increase in marketed values were shown last year for all the principal kinds of fish produced in the province. New Brunswick produces a wide variety of fish and shellfish, the most popular of which are: oysters, lobsters, clams, quahaugs, sardines, smelts, salmon, shad, cod, haddock, herring, mackerel, and pollock.

D. L. MACLAREN,

Lieutenant Governor, Province of New Brunswick.

NEW CALEDONIA. A French island in the western South Pacific, 1,069 miles northeast of Sydney, Australia. It has a total length of more than 248 miles and an average width of 31 miles. The area is 8,548 square miles, a little larger than Massachusetts. According to the July 1, 1936, census its population numbered 53,245, of whom 17,055 were free, 329 were convicts, and 28,800 were Melanesians and Polynesians. Nouméa, the capital, had a population of 11,108. Other centers include Bourail, La Foa, Moindou, St. Louis, and St. Vincent.

Dependencies of New Caledonia include (1) the Isle of Pines (58 square miles), 30 miles to the southeast; (2) the Wallis Archipelago (40 square miles), northeast of the Fiji Islands; (3) Futuna and Alofi (pop. 2,000), south of the Wallis Islands; (4) the Loyalty Islands (800 square miles), 60 miles east of New Caledonia and consisting of three large islands and numerous small ones; (5) the Huon Islands, a barren group 170 miles northwest of New Caledonia; (6) the Bélep Archipelago, 7 miles northeast of New Caledonia; (7) Chesterfield Islands, 342 miles west of the northern headland of New Caledonia; and (8) Walpole, about 93 miles southeast of Maré (Loyalty Islands).

Administratively connected with New Caledonia are the New Hebrides lying to the northeast and held under the condominium of France and Great Britain by the terms of conventions between the two powers signed in 1887, 1888, and 1906. A protocol ratified by France and Britain in 1922 guarantees the interests of the natives. There are about 40 islands in the New Hebrides group with an area of about 3,706,500 acres. In 1936 the French population numbered 750, the English 178, and native Kanakas estimated at from 43,000 to 60,000.

New Caledonia was discovered by Capt. James Cook in 1774 and visited by d'Entrecasteaux in 1793. French missionaries settled there in 1843 and ten years later it was annexed to France. The average temperature ranges between 65° and 72°. New Caledonia is one of the richest Pacific islands in minerals. Nickel deposits are particularly plentiful, and in 1944 the production amounted to 231,650 tons. There are also deposits of chrome, cobalt, antimony, mercury, silver, lead, and copper. The 1944 statistics show a production of 55,229 tons of chromium, 16,692 tons of gypsum, and 7,936 tons of iron ore. In July 1945, 14,000 tons of chrome were ready for export to France. The agricultural products include coffee, copra, cotton, manioc, corn, tobacco, bananas, and pineapples. The trade is chiefly with neighboring Australia. Exports in 1944 amounted to 25,700 tons valued at 226,700,000 francs, compared with 1938 exports of 94,000 tons valued at 146,500,000 francs. Imports in 1944 were 163,800 tons valued at 402,000,000 francs, compared with the 1938 figures of 184,900 tons valued at 158,600,000 francs. During the 1938-44 period the value of the franc, of course, suffered a very serious diminution. The following table, comparing the foreign trade statistics for the first 9 months of 1944 with those of the relative months in 1945, shows a small but remarkable increase, considering that they cover periods when France was still exerting her main effort to defeat Germany.

NEW CALEDONIA FOREIGN TRADE 1944, FIRST 9 MONTHS

		Value
Imports	125,500 tons	291,800,000 francs
Exports	15,700 tons	144,300,000 francs
Total	141,200 tons	436,100,000 francs

1945, FIRST 9 MONTHS

		Value
Imports	130,700 tons	325,600,000 francs
Exports	42,100 tons	155,500,000 francs
Total	172,800 tons	481,100,000 francs

In mid-1945, the governor of New Caledonia granted the status of free residents to Javanese and Tonkinese workers. He also instituted a 9-hour day with a minimum wage of 5 francs per hour or 45 francs per diem. A supplementary

wage is paid to workers with families; specialists also receive a higher wage. A program of public works was instituted with an initial appropriation of 200,000,000 francs.

NEW GUINEA. A Melanesian island, one of the largest in the world, lying north of Australia; area, 308,486 square miles; population about 1,300,000. Politically, the island comprises Netherland New Guinea, or Nieuw Guinee (see NETHERLANDS INDIES), and two areas administered by Australia: North Eastern New Guinea, mainland portion of the Territory of New Guinea (see NEW GUINEA, TERRITORY OF); and the Territory of Papua (see PAPUA, TERRITORY OF). During 1943-44 Australian military engineers constructed the first road across the Owen Stanley Mountains to connect Papua with North Eastern New Guinea; 100 miles in length, it ran from a point approximately 130 miles northwest of Port Moresby to the valley of the Bulolo River, behind Salamaua. The Japanese were driven from most of their remaining positions along the northern coast of the island during 1944, American and Australian troops establishing control over areas in the vicinity of Aitape, in North Eastern New Guinea, and at Hollandia and on the mainland opposite Toem and Wakde islands, in Netherland New Guinea; Hollandia became the headquarters of General Douglas MacArthur until he landed in the Philippines. Through the year the Australian areas continued under military control. The Australian House of Representatives enacted legislation on July 19, 1945, restoring Papua and the Territory of New Guinea to civil control, the two administrations which existed before the war being replaced by a single one; this latter arrangement was to continue until six months after the conclusion of hostilities. Appropriations from Australian revenue and funds from the Commonwealth War Damage Insurance scheme were to be provided for repair of the extensive damage done to large parts of New Guinea during enemy occupation. Elimination was promised of the native indenture system, whereby professional recruiters had been permitted to recruit native labor for employers at a rate per head; improved working conditions included standardized wages, together with rations, housing and medical care; and native education was to be extended.

NEW GUINEA, Territory of. A mandate from the League of Nations administered by Australia, 93,000 square miles in area. The enumerated population (1941) of 691,165 comprised 684,836 natives in patrolled areas and 6,329 nonindigenous inhabitants (of whom Asiatics numbered 2,288 and whites, principally British, totaled 4,101); natives in regions not administered were estimated to number 200,000. The mandate comprises North Eastern New Guinea, 69,700 square miles; Bismarck Archipelago (New Britain, New Ireland, Lavongai, and Admiralty Islands), 19,200 square miles; and the northernmost Solomon Islands (Bougainville and Buka), 4,100 square miles. Because of eruptions of Matupi volcano in 1941, the capital of the mandate was removed from Rabaul, in New Britain, to Lae, in North Eastern New Guinea. The Japanese made Rabaul the chief base of their military operations in the Southwest Pacific. During the war the United States constructed a large naval base on Manus Island, of the Admiralty group, and later extended the base to include neighboring Los Negros, building a bridge across Lonju Passage, which separates the two islands; the

Lorengau River, on Manus, was harnessed for hydroelectric power to supply the numerous permanent buildings, among which was a Coca-Cola plant. On Sept. 5, 1945, the Navy Department recommended that the United States should retain possession of the Manus Island base. An administrator (Brig. Sir Walter Ramsay McNicoll appointed Sept. 13, 1934) is assisted by nominated executive and legislative councils. Revenue in 1940-41 amounted to £423,750, and expenditure was £431,792. The public debt was £15,193. Coconut plantations occupied most of the 277,523 acres under cultivation in 1940; for production in 1944 see PAPUA. Other crops include coffee, cacao, and kapok; yams, taro, sago, and bananas are the chief native foodstuffs. Rich gold, silver, and platinum deposits have been mined to an extent limited by the difficulty of transporting machinery in almost roadless country; other known minerals include copper, iron, lignite coal, osmiridium, and sulphur. Exports in 1940-41 were valued at £3,247,585, and imports amounted to £962,129.

In November 1944 all garrisons of United States forces in the New Guinea and Solomons area were replaced by Australians and New Zealanders, who continued the operations against the Japanese. The Australian 5th Division landed in New Britain on November 4, and subsequently approximately 8,000 Australians hemmed some 50,000 to 60,000 Japanese in the restricted area of the Gazelle Peninsula. Rabaul, in the northern part of the 50-mile-square Gazelle area, was defended, according to the Japanese, by means of 200 miles of underground tunnels and fortifications and many positions cut into the hills. The Australian 3rd and 11th divisions operated on Bougainville and New Ireland against some 23,000 Japanese troops in those northern islands of the Solomons group; major fighting took place in the Buin area of Bougainville, where the Kahili airstrip was repeatedly bombed. In North Eastern New Guinea, a long and arduous campaign was fought by the Australian 6th Division, which drove the enemy far back into the jungles of Netherland New Guinea, to the northwest.

Gen. Hitoshi Inamura, commander of all Japanese forces in the mandated area, and Vice Admiral Jin-Ichi Kusaka, commanding the enemy's southeastern fleet, signed surrender documents aboard the British carrier *Glorious* outside Rabaul Harbor on Sept. 6, 1945, handing over their swords to Lieut. Gen. Vernon A. H. Sturdee, commanding the Australian First Army. Japanese forces in the northern Solomons were surrendered at Bougainville on September 8 to Lieut. Gen. Stanley G. Savage, commander of the Australian 2d Corps, by Lieut. Gen. Mastane Kanda, of the Japanese Seventh Army, and Vice Admiral Noboru Samejima. Enemy naval forces on the New Guinea coasts and on the islands of Kairuru and Muschu were surrendered at Wewak on September 11 by Rear Admiral Sato (muttering prayers to his ancestors for forgiveness); and two days later, at Wewak, the Japanese Eighteenth Army, which had fought so fiercely in North Eastern New Guinea, was surrendered by Lieut. Gen. Hatazo Adachi, its commander. Through systematic barbarity in the course of the war, the Japanese in the New Guinea area had done to death thousands of hapless Australian and American captives. See also AUSTRALIA, COMMONWEALTH OF—*Australia at War*.

NEW HAMPSHIRE. New England state, United States; one of the original thirteen states. Population (1940): rural, 208,299; urban, 283,225; total, 491,524. Land area, 9,024 square miles, divided into 10 counties. Population (1940) of chief cities: Manchester, 77,685; Nashua, 32,927; Concord, the capital, 27,171; Berlin, 19,084; Portsmouth, 14,821; Dover, 14,990; Keene, 13,832.

Chief State Officers, 1945.—Governor, Charles M. Dale; secretary of state, Enoch D. Fuller; treasurer, F. Gordon Kimball; comptroller, Arthur E. Bean; acting attorney general, Harold K. Davison.

Judiciary.—Chief justice of the state supreme court, Thomas L. Marble; associate justices, Oliver W. Branch, Elwin L. Page, Henri A. Burke, Francis W. Johnston.

Legislature.—New Hampshire's chief legislative body, the General Court (Senate, 24 members; House of Representatives, 399) meets biennially in odd years on the first Wednesday in January.

Education.—Public elementary schools (1943-44 school year, latest reported), 1,613; teachers, 1,831; pupils, 43,286; average yearly salary of elementary and junior high school teachers, \$1,753 (men), \$1,245 (women). Public junior high schools, 42; teachers, 234; students, 5,138. Public senior high schools, 89; teachers, 924; students, 17,622; average yearly salary of senior high school teachers, \$2,208 (men), \$1,586 (women). Teacher-training schools; Plymouth Teachers College (121 students) and Keene Teachers College (205). The University of New Hampshire receives financial aid from the state. Total state appropriation for education (1943-44), \$570,364; appropriation by cities and districts, \$6,863,124. Education is compulsory for children in New Hampshire between the ages of 8 and 14; between 8 and 16, if studies prescribed for elementary school have not been completed.

Finances.—Following is a statement of New Hampshire's finances for the fiscal year 1944-45, supplied by the state treasurer's office:

Balance in treasury, beginning of fiscal year 1944-45	\$ 4,966,368.35
Receipts, 1944-45	31,969,284.25
Total	\$36,935,652.60
Disbursements, 1944-45	30,875,930.28
Balance, beginning of fiscal year 1945-46	\$ 6,059,722.32

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.)...	631	640	615
Oats (1,000 bu.)....	276	259	259
Hay:			
Clover and timothy (1,000 tons)...	215	191	221
Tame (1,000 tons)...	386	354	416
Potatoes (1,000 bu.)...	1,270	1,064	1,054
Apples (1,000 bu.)...	733	778	171

NEW HEBRIDES. See NEW CALEDONIA.

NEW IRELAND. See NEW GUINEA, TERRITORY OF.

NEW JERSEY. Middle Atlantic state, United States; one of the original thirteen states. Population (1940): rural, 765,392; urban, 3,394,773; total, 4,160,165. Land area, 7,522 square miles, divided into 21 counties. Chief cities, with 1940 populations: Newark, 429,760; Jersey City, 301,173; Paterson, 139,656; Trenton, the capital, 124,697; Camden, 117,536; Elizabeth, 109,912;

Bayonne, 79,198; East Orange, 68,945; Atlantic City, 64,094; Passaic, 61,394.

Chief State Officers, 1945.—Governor, Walter Edge; secretary of state, Joseph A. Brophy; treasurer, Robert C. Hendrickson; comptroller, Homer C. Zink; attorney general, Walter D. Van Riper.

Judiciary.—Chancellor of the state court of appeals and errors, Luther A. Campbell. This court is composed of the chancellor, a chief justice, 8 associate justices, and 6 especially appointed judges.

Legislature.—The state legislature (Senate, 21 members; Assembly, 60) convenes annually on the second Tuesday in January.

Education.—Public elementary schools (latest report, 1943-44 school year), 1,721; teachers, 15,864; pupils, 423,133; average yearly salary of elementary school teachers, \$2,104. Public junior high schools (1943-44), 82; teachers, 1,860; students, 38,592. Public senior high schools (1943-44), 162; teachers, 7,640; students, 169,637; average yearly salary of junior and senior high school teachers, \$2,578. Education is compulsory in New Jersey for all children between the ages of 7 and 16, inclusive. There are six teacher training schools. Rutgers University and Newark Technical School and College of Engineering receive financial aid from the state. Total state appropriation for education (1943-44), \$31,620,655¹; appropriation by cities and counties (1944), \$113,619,047².

Finances.—Following is a statement of New Jersey's finances for the fiscal year 1944-45:

Balance in treasury, beginning of fiscal year 1944-45	\$ 55,175,099.70
Receipts, 1944-45	401,671,525.25
Total	\$456,846,624.95
Disbursements, 1944-45	394,811,935.27
Balance, beginning of fiscal year 1945-	
46	\$ 62,034,689.68

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	PRODUCTION		
	Average 1934-43	Final 1944	Preliminary 1945
Corn (1,000 bu.)	7,278	6,755	8,010
Oats (1,000 bu.)	1,346	1,209	912
Wheat (1,000 bu.)	1,218	1,380	1,386
Barley (1,000 bu.)	124	196	180
Rye (1,000 bu.)	309	245	225
Hay:			
Alfalfa (1,000 tons)	116	116	158
Clover and timothy (1,000 tons)	173	127	162
Tame (1,000 tons)	354	320	394
Sweet potatoes (1,000 bu.)	2,116	2,400	2,240
Potatoes (1,000 bu.)	9,633	8,804	12,960
Apples (1,000 bu.)	3,098	2,090	1,221
Peaches (1,000 bu.)	954	1,193	864
Grapes (tons)	2,540	2,600	1,100

NEW MEXICO. Mountain state, United States; admitted to the Union Jan. 6, 1912. Population (1940): rural, 355,417; urban, 176,401; total, 531,818. Land area, 121,511 square miles, divided into 31 counties. Principal cities, with 1940 populations; Albuquerque, 35,449; Santa Fe, the capital, 20,325; Roswell, 13,482; Hobbs, 10,619; Clovis, 10,065.

Chief State Officers, 1945.—Governor, John J. Dempsey; lieutenant governor, James B. Jones; secretary of state, Cecilia Tafoya Cleveland; treasurer, John J. Bingham; auditor, J. D. Hannah; comptroller, C. R. Sebastian; attorney gen-

eral, Clyde C. McCulloch; commissioner of public lands, John E. Miles.

Judiciary.—Chief justice of the state supreme court, Thomas J. Mabry; associate justices, Howard L. Bickley, Charles R. Brice, Daniel K. Sadler, Eugene D. Lujan.

Legislature.—The state legislature (Senate, 24 members; House of Representatives, 49) convenes biennially in odd years on the second Tuesday of January next after each general election.

Education.—At last report the state had 892 public elementary schools, with 4,436 teachers, and 114,029 pupils; there were 164 high schools having a student enrollment of 23,332 students. The average annual salary for public elementary school teachers was \$1,040; for high school teachers, \$1,369.

Finances.—The following statement of New Mexico's finances for the fiscal year 1944-45 was furnished by the state treasurer's office:

Balance in treasury, beginning of fiscal year 1944-45	\$ 9,754,599.11
Receipts, 1944-45	35,355,509.67
Total	\$45,110,108.78
Disbursements, 1944-45	35,858,043.98
Balance, beginning of fiscal year 1945-46	\$ 9,252,064.80

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following tables:

CROP (and unit of production)	PRODUCTION		
	Average 1934-43	Final 1944	Preliminary 1945
Corn (1,000 bu.)	2,628	3,510	2,100
Oats (1,000 bu.)	667	1,050	594
Wheat (1,000 bu.)	2,396	3,186	2,194
Barley (1,000 bu.)	362	896	550
Sorghums for grain (1,000 bu.)	2,234	5,560	865
Cotton (1,000 bales)	109	116	121
Hay:			
Alfalfa (1,000 tons)	294	382	369
Tame (1,000 tons)	354	458	424
Potatoes (1,000 bu.)	340	425	338
Apples (1,000 bu.)	731	760	625
Grapes (tons)	1,070	1,000	1,000

NEW SOUTH WALES. See AUSTRALIA.

NEW YORK. Middle Atlantic state, United States; one of the original thirteen states. Population (1940): rural, 2,313,249; urban, 11,165,893; total, 13,479,142. Land area 47,929 square miles, divided into 62 counties. Principal cities, with 1940 populations: New York, 7,454,995; Buffalo, 575,901; Rochester, 324,975; Syracuse, 205,967; Yonkers, 142,598; Albany, the capital, 130,577; Utica, 100,518; Schenectady, 87,549; Binghamton, 78,309.

Chief State Officers, 1945.—Governor, Thomas E. Dewey; lieutenant governor, Joe R. Hanley; secretary of state, Thomas J. Curran; comptroller, Frank C. Moore; attorney general, Nathaniel L. Goldstein.

Judiciary.—Chief justice of the state court of appeals, Irving Lehman; associate justices, John T. Loughran, Thomas D. Thacher, Albert Conway, Charles S. Desmond, Edmund H. Lewis, Marvin R. Dye.

Legislature.—The state legislature (Senate, 56 members; Assembly, 150) convenes annually on the first Wednesday after the first Monday in January.

Education.—Public elementary school teachers (latest report, 1943-44 school year), 44,018; pupils, 1,296,901; public junior high schools (1943-44), 137; teachers, 4,238; students, 143,345; public senior high schools (1943-44), 769;

¹ Including funds for state education department, state teachers colleges, etc.

² Exclusive of capital in the amount of \$538,759.

teachers, 24,078; students, 439,744. There are 11 state teachers colleges. Alfred, Cornell, and Syracuse universities receive financial aid from the state. Total state appropriation for education (1943-44), \$128,912,763; appropriation by cities and counties (1943-44), \$228,575,528. State commissioner of education and president of the University of the State of New York, Dr. George D. Stoddard. Education in New York is compulsory for children between the ages of 7 and 16, inclusive.

Finances.—Following is a statement of New York's finances for the fiscal year 1944-45, supplied by the state treasurer's office:

GENERAL FUND

Balance in treasury, beginning of fiscal year 1944-45	\$163,060,680.89 ¹
Receipts, 1944-45	517,047,051.29
Total	\$517,047,051.29
Disbursements, 1944-45	360,405,726.39
Balance, beginning of fiscal year 1945-46	\$156,641,324.90 ²

¹ Transferred to postwar reconstruction fund pursuant to chap. 1, laws 1944.

² Transferred to postwar reconstruction fund pursuant to chap. 4, laws 1945.

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.)	24,076	25,655	24,684
Oats (1,000 bu.)	23,781	25,017	21,518
Buckwheat (1,000 bu.)	2,396	2,700	2,244
Wheat (1,000 bu.)	6,614	8,932	9,651
Barley (1,000 bu.)	3,319	2,325	2,175
Rye (1,000 bu.)	357	270	323
Hay:			
Alfalfa (1,000 tons)	700	847	852
Clover and timothy (1,000 tons)	3,822	4,150	4,433
Tame (1,000 tons)	5,177	5,687	6,013
Tobacco (1,000 lbs.)	1,088	1,170	1,000
Beans, dry edible (1,000 bags)	1,232	731	755
Potatoes (1,000 bu.)	28,595	26,445	30,130
Cherries (tons)	20,535	25,000	9,900
Apples (1,000 bu.)	15,887	17,010	2,700
Peaches (1,000 bu.)	1,258	1,824	1,762
Pears (1,000 bu.)	1,053	1,157	320
Grapes (tons)	58,890	59,300	33,200

NEW ZEALAND. A self-governing Dominion within the British Commonwealth of Nations, in the South Pacific, 1,200 miles east of Australia. New Zealand proper, 103,416 square miles, comprises two main islands, North Island, 44,281 square miles, and South Island, 58,093 square miles, together with Stewart Island, 670 square miles, and Chatham Island, 372 square miles, the two latter being generally included with South Island for statistical purposes. Within the geographical boundaries of New Zealand as proclaimed in 1847, are also seven uninhabited islands or groups with a total area of 307 square miles, of which the largest is the Auckland Islands, 234 square miles. Islands annexed to New Zealand, in total area 212 square miles, comprise the Kermadec Islands, 13 square miles, the Cook Islands, 84 square miles, and other Pacific islands outside the Cook group, 115 square miles. Thus the Dominion of New Zealand has a total area of 103,935 square miles. The Dominion also administers the Ross Dependency, 175,000 square miles, an Antarctic ice-covered area, and the Tokelau (or Union) Islands, 3.5 square miles, besides holding a League of Nations mandate for Western Samoa, the two main islands of which have a combined area of 1,133 square miles (see SAMOAN ISLANDS). New Zealand also shares with

Great Britain and Australia the mandate for the island of Nauru (q.v.), 8.43 square miles.

Discovered by Abel Janszoon Tasman in 1642, the islands were first visited by Capt. James Cook in 1769, and subsequently by whalers, traders, and scientists. British sovereignty was proclaimed Jan. 30, 1840; the country was a dependency of New South Wales, Australia, until May 3, 1841, when it was created a separate colony. Self-government was granted in 1852, and in 1907 the colony of New Zealand became a dominion. The Maori, a Polynesian race, constitute 5 per cent of the total population; the white inhabitants are 98 per cent of British stock. As of March 31, 1944, the population, inclusive of the Maori but exclusive of the Cook and other Pacific islands, was estimated to number 1,643,909.

Wellington (pop. 1945 census, 172,887) is the capital, and Auckland (263,575) the largest city; other cities include Christchurch (149,741), Dunedin (83,055), Invercargill (27,419) and Wanganui (26,453).

Education and Religion.—Education is free, from the kindergarten to postprimary grades, and most university students obtain free education by means of scholarships or bursaries. Primary education is compulsory between the ages of 7 and 15. In 1943 there were 2,090 public primary schools, with 204,060 pupils, and 300 private primary schools with 28,467 pupils. Government and private postprimary schools, comprising secondary and others, numbered 228, having 37,976 pupils. At the end of 1942 there were 13,181 Maori children attending public primary schools with the white children; and at 156 additional native village schools were 10,278 Maori and 996 white children. There are four training colleges for teachers. The University of New Zealand consists of Canterbury University College at Christchurch, Auckland University College at Auckland, Otago University at Dunedin, and Victoria University College at Wellington. In 1943 there were 5,692 students at these four constituent colleges. There are 2 schools of agriculture attached to the university. The government expended £NZ5,221,389 on education in 1943-44.

There is no state religion. The chief denominations are the Church of England, with 625,618 communicants in 7 dioceses, with a separate bishopric for the Maori; Presbyterian with 368,970; Roman Catholic with 206,587; and Methodist with 126,755.

Government.—Executive authority is vested in a governor general appointed by the crown for a five-year term on the recommendation of the New Zealand government. His powers are exercised through an Executive Council, in fact a Cabinet of members elected to the House of Representatives, to which it is responsible. Legislative power belongs to the General Assembly, a Parliament comprising a Legislative Council of members (37 in 1944) appointed for seven years, and a House of Representatives of 80 members (4 of them Maori) elected by popular vote for the duration of Parliament—a maximum period of three years. In 1945, Lieut. Gen. Sir Bernard C. Freyberg was named governor general in succession to Marshal of the Royal Air Force Sir Cyril Louis Norton Newall when the latter's term should end on Feb. 21, 1946. At the age of two, General Freyberg was taken by his parents from his birthplace in Surrey, England, to New Zealand; he was wounded nine times in the First World War, and several times

during the recent conflict, in which he commanded the New Zealand Army Corps. Peter Fraser has been Labour prime minister of New Zealand since 1940. At the general election held Sept. 25, 1943, the Labour Party, which had held office since 1935, was again returned to power; it obtained 45 of the 80 seats in the House of Representatives, 34 going to the National Party and 1 to an Independent. The War Cabinet, which had had overall direction of the country's war effort since the spring of 1940, was dissolved Aug. 21, 1945; it had consisted of three members of the Labour government and two members of the National Party.

Public Welfare.—The state operates an extensive program of social security, providing benefits (pensions) for the aged, the family (for each child under 16, or under 18 if kept at school) widows, orphans, and invalids, as well as out-of-work pay for the unemployed. Medical and hospital benefits, also provided to all, comprise payments to hospitals and doctors and, in maternity cases, payments to obstetric nurses for home care when necessary; the cost of prescribed drugs, massage and X-ray examinations is also met by the state. For the year ended March 31, 1943, the state expended on these benefits of all classes £NZ15,432,644. The cost was met by annual registration fees payable by all adults, and by a charge of 5 per cent on salaries, wages and the income of companies; the £NZ12,213,640 thus derived was supplemented by a grant of £NZ3,600,000 from general state revenues. The National Provident Fund, which is subsidized by the state to the extent of one fourth of amounts paid in, ensures contributors an annuity at the age of 60, pensions to the widow and children should the contributor die, and pensions to the children should the contributor be incapacitated for work; in 1942 the fund amounted to £NZ6,862,358, 28,508 contributors paying £NZ343,753 during the year. At the end of 1942 there were 96,275 State Life Assurance policies in force, the sum assured and bonuses having a value of £NZ34,200,214; the ratio of expenses to total income was 7.62 per cent. The State Fire Office had a total net income in 1942 of £NZ280,719, and the reserves and funds at the end of the year totaled £NZ1,241,271; the ratio of claims to premiums was 15.4 per cent. At March 31, 1943, the State Advances Corporation, which loans money for farms, city dwellings, and the development or establishment of industries, had 60,849 loans under administration for a total sum of £NZ54,067,802; the lending rate for loans on mortgage was 4½ per cent.

Social security benefits were increased in the 1945-46 budget. Age benefits were raised from £1 12s. 6d. a week to £2 a week, with comparable increases in widows', invalids', miners', sickness, unemployment, and war veterans' allowances. To ensure a minimum family income of £5 a week, on the basis of a family of two children, during periods of sickness, unemployment, or invalidity, the allowance would be increased to £2 each for the father and mother, and 10s. for each child; widowed mothers were to receive £2 a week, plus 10s. for each child, and childless widows would be paid £1 10s., instead of the former weekly rate of £1 5s.

Finance.—The revenues of the Consolidated Fund (the civil budget) at March 31, 1944, stood at £NZ48,828,000, and expenditure amounted to £NZ46,596,000. Budgetary estimates for 1945-46 put Consolidated Fund receipts at £NZ57,294,000 and expenditure at

£NZ56,079,000, leaving an estimated surplus of £NZ1,215,000. Although the public debt greatly increased during the war years, over two thirds of the total was held in the Dominion; as of March 31, 1945, the external debt was £NZ199,964,278 and internal debt was £NZ403,274,133, making a total public debt of £NZ603,238,411. In the 1945-46 budget war expenditure was put at £NZ105,400,000; with the end of hostilities the estimate was revised up to the probable date of demobilization, the increased figure of £NZ139,249,000 including expenditure on balances of pay to returned servicemen, provision for three months' leave on full pay and allowances, deferred pay, and war gratuities. During 1944-45, New Zealand supplied materials and services to the United States under reverse lend-lease (reciprocal aid) in excess of the aid received by her. Disregarding the substantially higher price basis operating overseas as compared with New Zealand prices, the Dominion provided reverse lend-lease goods and services valued at £NZ26,700,000 and received like assistance from overseas totaling £NZ24,600,000 (£NZ24,300,000 in lend-lease from the United States and £NZ300,000 in reciprocal aid from Canada). Reverse lend-lease for 1945-46 had been estimated at £NZ24,000,000, and this figure was cut by only £NZ2,000,000 in the revised estimate to demobilization.

War Participation.—Enlistment for home defense was made compulsory in 1940, and for overseas wherever required in 1942. Troops were not withdrawn from the Middle East and Europe after Japan entered the conflict in 1941, New Zealanders serving in all campaigns in those theaters until the close, and in May 1945 being called upon to occupy Trieste and Gorizia, in the disputed Venezia Giulia area of Italy. In June, New Zealand commenced to organize a force for service in the Southwest Pacific, where already its air force was serving with the Australians against Japanese positions in the Solomons. At the end of June 1945, the Dominion's armed forces totaled 100,228, of whom 42,128 were in New Zealand (including 4,700 women) and 58,100 overseas; of the overseas forces, 46,765 were allocated to the European theater. New Zealand dead in battle were in proportion to 5.5 per 1,000 of the population, a rate nearly equal to that of Britain itself. Total casualties at the end of June 1945 were 30,085, this figure comprising 9,907 killed, 773 missing, 19,282 wounded, and 123 prisoners of war. The total cost of the war to New Zealand down to the end of March 1945 had been more than £NZ500,000,000. After the war ended, New Zealand organized a force of 4,000 men to form part of a British Commonwealth division in the occupation of Japan.

Local Government.—While the central government is concerned directly with education, main highways, public health, and police throughout the country, as of April 2, 1942, there were 681 authorities responsible for local governments. These comprised county and borough councils and town boards, and numerous boards dealing with such matters as rivers, land drainage, water supply, fire protection, harbors, electric power supply, hospitals, and control of the rabbit pest. Receipts came from rates (local taxes), revenue from public utilities, licenses and rents, and payments from the central government—principally subsidies and a proportion of the tax on gasoline. In 1941-42 the total receipts of local authorities amounted to £NZ24,016,536, and

the expenditure was £NZ24,072,092; the net indebtedness of local bodies totaled £NZ56,779,434 on March 31, 1942.

Agriculture.—Of the total area of 66,390,196 acres within the Dominion, 42,958,555 acres are occupied by private holdings, 67 per cent of the occupied land being held in areas of 1,000 acres and upwards; freehold and leasehold lands are in approximately equal proportions. In 1942-43, 19,931,050 acres were under cultivation, of which 1,911,833 acres were devoted to field crops. The acreages under the principal field crops in 1942-43 were as follows: wheat, 290,158; oats, 242,365; barley, 35,261; and corn, 12,535. In 1943-44 the crops, in bushels, were: wheat, 7,700,000; oats, 2,100,000; and barley, 1,120,000. Phormium, or New Zealand flax, occupied 30,288 acres in 1942-43 (47,264 acres in 1941-42); and the growing of linen flax, an entirely new industry for the Dominion, accounted for 21,067 acres. In 1944 the crop of apples totaled 2,120,000 bushels; of pears, 260,000 bushels; and of hops, 750,000 pounds.

Pastoral Production.—Animal husbandry is the foremost pursuit of the country. With 33,083,318 sheep as of April 30, 1944, New Zealand ranked seventh among the sheep countries of the world; and in production of wool (340,000,000 pounds for the year ended June 30, 1943) it ranked fourth. In 1944 the total number of cattle was 4,476,200; of pigs, 581,000; and of horses, 239,000. The yield of butterfat per cow in 1943-44 was estimated at 240 pounds, the total butterfat produced in the country amounting to 422,700,000 pounds. Exports of butter in 1944 were valued at £NZ14,998,622; of cheese, £NZ7,270,331; of wool, £NZ16,306,591; and of frozen lamb, £NZ9,394,354. In 1942-43, 325,570 hundredweight of ham and bacon, to a value of £NZ1,860,931, was produced.

Mining Production.—No figures were available during the early years of the war showing the production of gold and silver. Gold production in 1943 amounted to 149,140 ounces; and silver, 280,786 ounces. The output of coal in 1942 was 2,680,041 tons, 4,997 persons being employed above and below ground; each person employed underground raised, on an average, 732 tons. Stone was quarried to a value of £NZ539,904 over the same period, and tungsten ore having a value of £NZ32,309 was mined. Other minerals mined included antimony, asbestos, iron, manganese, mercury, platinum, and scheelite.

Factory Production.—Because of the closing of sources of supply, during the war local manufacturers were catering to the Dominion's needs in many products which formerly were almost exclusively imported. There were 6,367 factories in operation in the fiscal year 1941-42, 117,214 persons being engaged chiefly in clothing manufacture, meat freezing, sawmilling, and printing and publishing; the value of the manufactures or products was £NZ155,566,195, of which £NZ53,315,335 was added in the process of production.

The Dominion's three-year-old stabilization plan was modified drastically on Feb. 14, 1945, when the government permitted labor unions dissatisfied with existing pay rates to apply to the Arbitration Court for review. Reconversion was commenced in July, when 184 businesses were removed from the essential list, their labor force being unfrozen and the supply of materials being affected. At outbreak of war, an aircraft plant was established at Rongotai, a suburb of

Wellington, by the (British) de Havilland firm to build Tiger Moths and other training planes; the factory was reconverted in 1945 to produce 11-seat passenger planes adapted to New Zealand's civilian needs. A Ministry of Employment was created in September to aid in the rehabilitation of ex-servicemen and to assist workers requiring occupational adjustment or retraining.

External Trade.—Due largely to a decrease in the importation of defense materials and equipment, imports for the calendar year 1944 fell to £NZ86,686,531—compared with the record figure of £NZ95,148,017. The leading imports were cotton piece goods, electrical machinery, wireless equipment and other machinery, tea, sugar, and motor vehicles. Exports for the calendar year 1944 rose to £NZ77,704,663 (£NZ71,838,940 in 1943), a figure exceeded only in 1942 (£NZ80,875,132). These figures were not necessarily an indication of production in those years, for the volume exported depended greatly upon the availability of shipping. Principal exports were butter, cheese, wool, and meat either frozen, dehydrated, potted, or canned. The adverse balance of trade in 1944 was only £NZ8,981,868, compared with £NZ23,309,077 in 1943. Sterling balances in London were higher than ever, on Sept. 1, 1945, standing at stg. £66,610,417, a figure more than double that 12 months earlier.

Responding to an appeal to free more food for Great Britain, on June 1, 1945, the ration of butter for civilians of New Zealand was cut from 8 ounces to 6 ounces per person per week, and the meat ration was reduced from 1s. 9d. to 1s. 6d. per week for each person; these measures made a further 5,000 tons of butter and 15,000 tons of meat available for export annually.

Communications.—For the year ended March 31, 1944, there were 3,460 miles of railroads, all but 180 miles being state-owned. An all-time record was established by the railroads in 1943-44, when 38,611,267 passengers were carried and freight transported amounted to 10,109,821 tons; over 10,000,000 persons also used the road motor services operated by the railroad administration. At March 31, 1943, there were 53,238 miles of formed roads in the Dominion and, in addition, 5,799 miles of bridle tracks and 17,226 miles of unformed roads, giving a total road mileage of 76,263. The number of motor vehicles licensed at March 31, 1944, was 292,887, being one to every six persons in the country. With some 245,000 telephones, New Zealand has the world's third highest telephone development in proportion to population; a direct radiotelephone service between the Dominion and the United States was inaugurated in October 1945. During 1943-44 internal aviation services carried 38,145 passengers, 244,614 pounds of mail, and 191,114 pounds of freight; on overseas services, the figures were 2,924 passengers, 94,106 pounds of mail, and 40,024 pounds of freight. It was disclosed in 1945 that the longest civil air route in the world (15,000 miles) has been in operation since 1943 between New Zealand and Great Britain; it includes a 3,500-mile flight across the Indian Ocean from Ceylon to Western Australia, more than 24 hours in the air without alighting.

Principal Events of 1945.—Prime Minister Peter Fraser arrived in Britain late in March 1945 to participate in Commonwealth discussions prior to the meeting in San Francisco of the United Nations Conference on International Organiza-

tion; he declared that his country had the single motive of grasping this opportunity—which might well be the last—to build on victory an edifice of lasting peace. New Zealand's delegates at the conference were the prime minister and Carl A. Berendsen, the latter minister at Washington, and Sir Michael Myers, the Dominion's chief justice, a member of the United Nations Committee of Jurists; the prime minister served as chairman of the committee which framed the provisions of the United Nations charter on territorial trusteeship, a subject upon which there was wide divergence in views. The charter of the United Nations and the statute of the International Court of Justice were ratified by the New Zealand Parliament on Aug. 7, 1945.

During the year, the Dominion was also represented at several other conferences overseas, including the meeting in Australia of UNRRA's Committee of the Council for the Far East, the third session, in London, of the Council of UNRRA, and Commonwealth conferences on telecommunications and air transportation.

For the first time, both France and the Soviet Union appointed ministers to New Zealand, the former represented by Felix Alexis Armand Gazel, and the latter by Ivan Kornilovich Ziabkin. Sir Patrick Duff arrived in Wellington as the new high commissioner in New Zealand for the United Kingdom. In October 1945, Avra M. Warren was nominated by President Truman to succeed Kenneth S. Patton as United States minister to New Zealand.

Conclusion of hostilities brought particular recognition of the United States' contribution toward victory. "Today," said the prime minister, "we think of our friends, the Americans, treacherously attacked at Pearl Harbor and then, without even pausing to take breath, rallying their mighty forces, military and industrial, and sweeping ever westward until Japan began to crumble under their overwhelming attacks." New Zealand, too, had borne a full share of the burdens of war. In proportion to population, casualties among the Dominion's armed forces were considerably heavier than those suffered by the United States, and New Zealand supplied American troops in the Southwest Pacific with goods at a cost which eclipsed the value of lend-lease aid by the United States to the Dominion.

Social services were further extended during the year, including free dental service for adolescents to 19 years of age, an increase in the minimum income for needy families, and increases in superannuation and workers' compensation allowances. A Royal Commission was appointed by the government to inquire into the existing (alcoholic) licensing laws. Plans for reconversion included a program for the acquisition of land for veterans and provision of the requisite housing and communications; and improvements were to be effected in the railroad system. While few changes in tax rates were proposed in the 1945-46 budget, adjustments for industry provided a 7.5 per cent depreciation allowance, plus special authority to write down a plant's value 20 per cent over a 15-year period; the effect was to halve the tax value of the plant in that period. As part of the reconversion plan, manufacturers planned to spend £NZ2,875,000 on plant extension and £NZ2,000,000 on new equipment. For the purpose of eliminating double taxation, an agreement was contemplated with the British government whereby English companies establishing branch factories in New Zealand would be taxable in

the United Kingdom on the total profits, subject to a credit for tax paid in New Zealand on profits made in the Dominion. Considerable opposition was forthcoming from financial circles to the government's proposal that the state should acquire all privately owned shares in the Bank of New Zealand; the state already owned one third of the stock and had the power to appoint two thirds of the directors. Nationalization of the institution, which did half the country's branch banking business, had been strongly advocated by the Labour Party, but critics considered that its transformation into a state trading bank might prove to be bad economics.

WHEELER B. PRESTON,
Author and Publicist.

NEWBERRY, Truman Handy, American industrialist and politician: b. Detroit, Mich., Nov. 5, 1864; d. Grosse Pointe Farms, Detroit, Oct. 3, 1945. Secretary of the navy in the Cabinet of President Theodore Roosevelt from Dec. 1, 1903, to March 6, 1909, and Republican senator from Michigan from 1919 to 1922. Mr. Newberry was a leading Michigan industrialist and one of the richest men in the United States. After graduating from the Sheffield Scientific School at Yale University in 1885, Mr. Newberry took over management of the family railroad and banking interests. He worked as superintendent of construction, pay master, and general freight and passenger agent of the Detroit, Bay City, and Alpena Railway (1885-87), and then became president and treasurer of the Detroit Steel and Spring Company (1887-1901). The advent of the automobile attracted his interest, and he was largely responsible for the founding of the Packard Motor Car Company and its establishment in Detroit. During the Spanish-American War, he served as navy lieutenant (j.g.) and during the First World War as lieutenant commander in the United States Naval Fleet Reserve, and also as assistant to the commander of the 3rd Naval District of New York. He was appointed assistant secretary of the navy in 1905. In 1918 he was elected to the United States Senate on the Republican ticket, defeating Henry Ford by 4,334 votes. While the Senate was preparing to investigate both the Newberry and Ford campaign expenditures, a federal grand jury in Michigan indicted Mr. Newberry on charges of criminal conspiracy to violate the federal corrupt-practices act, and he was fined \$10,000 and sentenced to two years in jail on March 20, 1920. Investigations showed that more than \$250,000 had been spent on his campaign, while the Michigan law put the maximum amount that could be spent at \$3,750. The sentence was appealed and on May 2, 1921, the Supreme Court gave its decision reversing the verdict. The court held that the federal Constitution did not permit Congress to regulate primary elections, and the indictment covered the primary as well as the general election. Mr. Newberry formally took his place as a member of the Senate on Jan. 12, 1922, three years from the time he would normally have been accepted. He resigned 11 months later.

NEWFOUNDLAND and LABRADOR. Respectively, an island under British sovereignty off the east coast of Canada, and its dependency on the North American mainland. The area of Newfoundland is 42,734 square miles, and the population (1945) 308,022; Labrador, 118,400 square miles, population 4,930. Saint John's (pop., with suburbs, 82,543) is the capital and principal seaport of Newfoundland, and Corner Brook (11,-

000), Grand Falls (7,000), Bonavista (5,000), and Harbour Grace (2,300) are other towns, the two latter being also ports; chief port and settlement of Labrador is Battle Harbour (pop. 250), and Rigolet is a second small seaport. Newfoundland, Britain's oldest colony, acquired responsible government in 1855, and Labrador was confirmed in 1927 as under its jurisdiction. In 1940-41, "freely and without consideration," the United States obtained 99-year leases for military and naval bases on the Avalon Peninsula and on the southern coast of Newfoundland.

Government.—Because of financial difficulties, Newfoundland's dominion status was suspended in 1934 and administration was vested in a commission, with Great Britain assuming financial responsibility until the island again becomes self-supporting. A governor (the term of Vice Admiral Sir Humphrey Thomas Walwyn expires in January 1946) acts on the advice of a Commission of Government having six members, three of them from Newfoundland and three from Great Britain. Each commissioner heads departments of the administration, namely: public health and welfare; natural resources; justice and defense; public utilities; home affairs and education; and finance. Revenue for the financial year ended March 31, 1945, was \$33,310,000, an increase of \$4,709,000 over the preceding 12 months, and expenditure was \$26,318,000, the surplus being \$6,992,000. The national debt at the end of 1934-44 was \$90,000,000. Estimated revenue for 1945-46 was put at \$29,087,300 and expenditure at \$28,404,300, leaving a prospective surplus of \$683,000.

Religion and Education.—Of the total population, 92,732 adhere to the Church of England; 93,925 are Roman Catholics, 76,134 United Church, 1,460 Presbyterians, 18,054 Salvation Army, and 7,306 members of other denominations. The schools, although denominational, are supported by the government. In 1944-45 government grants for education amounted to \$2,462,700. Education is compulsory between the ages of 7 and 14. There were in 1944, 1,164 schools, with an enrollment of 67,641. The University Memorial College had an enrollment of 254 in 1943-44.

Production.—The population chiefly inhabits the coastline, and fishing is the principal occupation. In 1943-44 exported products of the fisheries were valued at \$18,486,226. Besides cod, which occupies the predominant place, the fisheries comprise salmon, herring, halibut, turbot, and lobster. Agriculture consists principally of vegetable production; the estimated value in 1943 was \$5,900,000. Livestock included 17,000 horses, 25,000 cattle, 95,000 sheep, 12,000 pigs, 15,000 goats, and 450,000 head of poultry. Forest products exported in 1943-44 were valued at \$1,915,514. Large paper and pulp mills at Grand Falls, on the east coast, and Corner Brook, on the west coast, produced in 1943-44, 251,536 tons of newsprint, 30,845 tons of sulphite pulp, and 5,695 tons of unbleached pulp. All local manufactures exported in 1943-44, including paper and pulp, had a value of \$42,397,415. Newfoundland is rich in mineral deposits. In 1943-44 exports of products of the mines were valued at \$8,029,416. The quantities exported in 1943, and their value, was as follows: iron ore, 791,688 tons (\$2,019,695); zinc concentrates, 261,299 tons (\$1,701,777); lead concentrates, 42,561 tons (\$1,414,535); fluorspar, 66,615 tons (\$1,360,659); and copper concentrates, 20,498 tons (\$937,621). Other minerals of eco-

nomic importance include pyrophyllite and limestone. There are 30 fur ranches in Newfoundland, for foxes and mink, while the beaver is protected in special reserves; furs to the value of \$242,420 were exported in 1943-44.

External Trade.—Exports in 1943-44 had a total value of \$44,444,620; in the main, they comprised the products of the fisheries, mines, and forests. The value of imports in 1943-44 was \$62,488,649, the principal items being flour, sugar, confectionery, boots and shoes, cattle and poultry feed, and leather. The United States provided the principal market for Newfoundland's exports, Great Britain being in second place; most of the imports came from Canada, the United States ranking second.

Communications.—There are 705 miles of government-owned railroads and 56 miles of private lines. The government system also operates coastwise steamships and, in summer, a tri-weekly ferry between Port aux Basques and North Sydney, Nova Scotia, where it connects with the Canadian National Railways. Highways total 6,440 miles in length; 6,677 automobiles and trucks were registered in 1943. The government operates 167 wireless telegraph stations and land line offices in Newfoundland, and 58 wireless telegraph stations in Labrador; radio telephony is available to all parts of the world. Gander Airport, the property of the Newfoundland and British governments, is used for passenger and mail services to Canada; as an interim and temporary arrangement, transatlantic aircraft of three United States companies use Gander for refueling and other service reasons but may not take on or discharge passengers or mail. Pan-American Airways and British Overseas Airways Corporations use Botwood, a seaplane base; and Torbay, near Saint John's, is used by a Canadian air transport company. The United States government has constructed on its bases two military airfields—Harmon Field, near Stephenville, and Argentia. In Labrador, the Canadian government has secured on 99-year lease an airfield at Goose Bay to be used for commercial purposes.

Principal Events.—Heavy expenditures made in Newfoundland for defensive purposes during the war helped substantially to put the island's finances in the black for the first time since the government went bankrupt in 1934. Each year since 1940 revenue has exceeded expenditures, the surpluses for five years totaling \$23,926,000 gross, \$22,676,000 net. With the possibility that the country will be able to continue solvent, prospects for restoration of self-government were studied by a small body set up by Great Britain in 1943, and as a result of its report proposals for a form of elected government to replace rule by an appointed commission were expected to be published early in 1946.

Over 11,000 Newfoundlanders volunteered for active service in the war. Besides 2,000 men in the Overseas Forestry Unit and 1,500 serving in the British Merchant Navy, 6,475 joined the British armed forces; casualties among the last totaled 551. In addition, 1,124 Newfoundlanders enlisted in the Canadian forces, 524 of them being women.

Provision for an extensive program of reconstruction was made in the 1945-46 budget, more than 60 per cent of the increased expenditure of \$4,000,000 for the financial year being allocated for the purpose. Considerable additions were made to the sums to be spent on education and public health. The Newfoundland Indus-

trial Board, created by the government in 1942, undertook important hydrographic and geological surveys in 1945, and encouraged establishment of new industries by offering preferential tariff rates in respect to the importation of necessary materials. The Newfoundland Tourist Development Board, also, made plans for attracting additional numbers of summer visitors to the country through the greatly increased air transport facilities.

NICARAGUA. A Central American republic bounded on the north by Honduras and on the south by Costa Rica. Its area is stated as 57,143 square miles, although this is in doubt because of an unsettled boundary dispute with Honduras. The population according to the 1940 census was 983,160; it was estimated in 1942 at 1,030,700. A breakdown of the population shows 68 per cent *mestizos* (mixed blood), 17 per cent white, 10 per cent Negroes, and five per cent Indians. The country was conquered by the Spanish early in the 16th century and was named for an Indian chief, Nicaraö. With the rest of Central America, it obtained independence in 1821 and became a separate state on the breakup of the Central American confederation in 1839. Its present constitution dates from March 22, 1939, and provides for a president popularly elected for a six-year term, a Senate of 15 members elected for six years, plus all elected ex-presidents (who serve for life), a Chamber of Deputies chosen on a population basis, a cabinet of secretaries of state, and a judiciary headed by a Supreme Court of Justice. The country is divided into 15 administrative departments and two *comarcas* (territories). The capital is Managua (pop., 1942 estimate, 118,448); other important cities are León (38,637), Granada (25,530), Masaya (21,070), Chinandega (16,321), Bluefields (10,099). President in 1945: Gen. Anastasio Somoza.

Religion and Education.—The prevailing religion is Roman Catholicism; the republic has one archbishopric and four bishoprics. Illiteracy is estimated at more than 70 per cent of the population. The latest available enrolment figures show 53,743 students in 840 elementary schools and 1,315 students in 19 secondary schools. Universities exist at Managua, León, and Granada.

Production.—Nicaragua is primarily an agricultural country. Of 20,000,000 acres considered suitable for cultivation, about 5 per cent are so utilized. The principal crops for domestic consumption are corn, beans, rice, potatoes, wheat, and sugar; coffee, sesame seed, and bananas are the chief export crops. The acreage planted to crops in 1944 was 395,491, of which 220,280 was in corn. A serious drought on the west side of the continental divide that began in August 1944 continued into 1945 and seriously reduced all agricultural production except in cotton. Coffee production in the 1944-45 season was estimated at 218,000 bags of 60 kilograms; this would permit an exportable surplus of about 197,000 bags. Production of sesame seed, second most important agricultural export, was approximately 8,000,000 pounds in 1944, a reduction of 500,000 pounds from the 1943 crop. The corn crop for the 1944-45 season was expected to be 2,200,000 bushels, a decline of 26 per cent from 1943-44. The rice crop for 1944-45 was estimated at 12,000,000 to 14,000,000 pounds, well under the production for 1943-44. Outlook for the banana industry was poor, due both to transportation difficulties and inroads

of the Sigatoka and Panama blight diseases. Cotton production was estimated at 1,254,000 pounds; tobacco production at 1,000,000 pounds. Timber production increased somewhat in 1944 from that of 1943; 1945 pine production was estimated at 14,000,000 board feet. Other forest products included rubber, ipecacuanha root, and balsam of Peru. Chief items of industrial production are cigarettes, matches, cement, beer, rum, industrial alcohol, soda water, cotton textiles, shoes, furniture, and tiles. Cement production increased 211 per cent in the first quarter of 1945 over the corresponding period of 1944, production of matches increased 52 per cent for the same period, that of beer 18 per cent, but production of electricity dropped 18 per cent in the same period. Gold production in 1944 was 219,579.1 troy ounces (219,189 ounces in 1943); 1944 silver production was 254,457.2 troy ounces (in 1943: 254,989.2 ounces).

Communications.—Latest available statistics indicated 283 miles of government owned and 137 miles of privately owned railway, 3,151 miles of highway, an automotive vehicle registration of 1,484, approximately 1,510 telephones with 2,315 miles of line, 130 telegraph offices with 4,098 miles of line, eight radio broadcasting stations and about 6,000 receiving sets, and 138 postoffices. Principal recent highway projects have been the Pan American Highway and the Roosevelt Highway from the settled area around lakes Nicaragua and Managua to the Atlantic coast. Expenditures on highway construction in the early months of 1945 were close to \$200,000 monthly. The Matagalpa detour on the Pan American Highway was expected to be an all-weather road by the end of the 1944-45 dry season and all-weather sections of the Atlantic Highway were expected to be completed by Jan. 1, 1947. Airplane transportation is furnished chiefly by Pan American Airways and Transportes Aéreos de Centro América (TACA), though two local aviation companies began operations in 1945.

Foreign Trade.—Total foreign trade for 1944 was estimated at \$25,000,000 (imports \$10,000,000 and exports \$15,000,000), as against \$28,970,000 in 1943. Chief items of 1944 imports were: textiles, \$2,000,000; machinery and vehicles, \$1,800,000; chemicals, \$1,500,000; foodstuffs, \$1,200,000; petroleum products, \$1,100,000. Chief exports were: gold, \$7,864,699; coffee, \$3,700,000; rubber, \$1,000,000. The basic quota for coffee production is 195,000 bags of 60 kilos; this figure was increased for the 1944-45 season to 274,897. Coffee exports to the United States in 1943-44 totaled 218,188 bags. The coffee export tax was reduced 50 per cent by decree of Dec. 16, 1944. It was expected that about 10,800 metric tons would be exported in 1945 as against 13,176 tons in 1944 and 11,967 tons in 1943. Lumber and log exports in 1944 were 13,679,580 board feet valued at \$661,719 as against 11,941,965 board feet valued at \$529,998 in 1943. Trade figures for 1945 are necessarily incomplete. Gold exports in the first five months were valued at \$3,108,887, more than 11 per cent below the value of gold exports for the same period of 1944. Rubber exports for the first five months of 1945 were 1,305,512 pounds as against 1,475,231 pounds for the same period in 1944. Coffee exports from October 1944, through June 1945, were 158,508 bags.

Finances.—The 1944-45 budget balanced at 54,114,871 córdobas (córdoba = approximately

20 cents); this represented a 20 per cent increase over the budget for 1943-44; the budget for 1936-37 was only C4,876,237. The largest increase in 1944-45 was in the Department of Public Administration (57.7 per cent more than in 1943-44); the largest appropriations were: development and public works, C7,154,158; government railways and ships, C6,550,723; and war, navy, and aviation, C6,010,370. Largest items of estimated receipts were: internal revenues, C19,723,200; and customs, C10,202,000. The budget for 1945-46 was rumored early in 1945 to be calculated at more than C50,000,000. Total public debt, March 24, 1945, was \$5,083,423; more than half of this was in the form of Export-Import Bank loans. The stabilization fund on June 30, 1945 contained \$7,509,855, a decrease of 22 per cent in one year.

Economic Conditions.—Though most indices of industrial production were up in 1944, general economic conditions were unfavorable. These included the rapidly rising cost of living, the continued shipping shortage (less acute by the spring of 1945), the government's ineffective price control system, a serious drought, and lack of adequate agricultural machinery. Inflation and the application of a new labor code April 2, 1945, led to some strikes. The government increased wages of railway workers by 20 per cent on Feb. 10, 1945, and announced plans for construction of 6,000 low-cost dwellings within a four-year period. Total monetary circulation June 30, 1945, was C46,512,975 as against C38,325,293 one year earlier. Bank deposits April 30, 1945, were C47,762,981 as against C52,108,691 one year earlier. The National Bank by June 30, 1945, had loaned C4,248,917 for agricultural development but retail prices of many staple foods had by the early part of 1945 risen by from 50 to 500 per cent. Dollar exchange continued short in mid-1945. The government on June 27 extended its production contract with the Rubber Development Corporation for two years.

Principal Events.—Political conditions, which had been highly disturbed in 1944, were less upset in 1945, with the result that President Somoza in mid-1945 felt free to hint that he might be a candidate for re-election in 1947 despite earlier pledges to the contrary. The Nicaraguan delegation to the Mexico City conference sponsored a resolution for adherence to the Atlantic Charter, adopted March 6, 1945; Nicaragua had earlier embodied the principles of the Atlantic Charter in her constitution. The government on July 6, 1945, became the first in the world to ratify the United Nations Charter. Representative Izac (Dem., Calif.) on Jan. 7, 1945, introduced a bill in the United States Congress to construct a canal across Nicaragua at a cost of \$500,000,000. President Roosevelt on March 22 nominated Fletcher Warren of Texas as the new United States ambassador to Nicaragua; he presented his credentials May 10. A United States military mission headed by Lieut. Gen. G. H. Brett and Rear Admiral H. F. Kingman arrived at Managua May 27 for conferences. The Nicaraguan Congress received a bill May 9 to allow full woman suffrage. Ex-President José María Monchada died February 23.

NIMITZ, Chester William, United States naval officer: b. Fredericksburg, Texas, Feb. 24, 1885. As commander in chief of the United States Pacific Fleet from December 1941, and commander of the Pacific Area, Fleet Admiral Nimitz had administrative control of all ships and naval shore bases in the Pacific, and strategic command of all that vast ocean (with the exception of those areas under General MacArthur's jurisdiction) for the Allied war against Japan. At the time he was jumped to his Pacific command over 28 senior flag officers, he was junior rear admiral and chief of the Bureau of Navigation. He used a badly crippled post-Pearl Harbor fleet to excellent advantage in the first bitter months after the Japanese attack, and later directed its recovery and development into the greatest naval force ever assembled by any one nation. His brilliant conduct of naval operations in the Pacific made possible General MacArthur's return to the Philippines in October 1944, and by the spring of 1945, had almost completely nullified the Japanese Navy. On August 29, 1945, Admiral Nimitz was flown from his Guam headquarters to board his flagship in Tokyo Bay after Japan's unconditional surrender. On Sept. 2, he signed the surrender document for the United States aboard the battleship *Missouri*. On October 5, he was accorded a hero's welcome in Washington, D.C.; addressed a joint session of Congress; and was awarded his third Distinguished Service Medal by President Truman. On November 26, his nomination to succeed Fleet Admiral Ernest J. King as chief of naval operations was confirmed by the Senate. Nimitz has held the rank of admiral of the fleet since December 1944. A graduate of the United States Naval Academy (1905), he spent many years in the submarine service.

NITROGEN. In June 1944, it had been anticipated that at least 675,000 tons of nitrogen would be obtainable for fertilizers, or about 7 per cent more than the 630,000 tons used in 1943-44. In September, estimates placed the possible supply at only 530,000 tons, but in November expectations had risen slightly to 576,000 tons. The annual nitrogen capacity of the United States in April 1945 was about 1,450,000 tons, of which 750,000 tons was of government plants and 700,000 tons of plants belonging to private owners. In 1944 large quantities of natural sodium nitrate and much smaller quantities of potassium-sodium nitrate continued to be imported from Chile under a wartime subsidy whereby the United States government absorbs some of the increased costs. However, the shortage of ships resulting from worldwide military and naval operations caused a bottleneck in the movement of Chilean nitrate to the United States. In October 1944 the War Production Board established an A-3 shipping priority for 850,000 tons of 16 per cent Chilean nitrate of soda for the year ending June 30, 1945, a figure considerably more than the reported 597,000 brought in during the 1943-44 fertilizer year. Ammonium nitrate was produced in both government and private plants in 1944, and considerable quantities were imported from Canada. Although production figures are not available, the consumption in the 1943-44 fertilizer season for fertilizers was approximately 300,000 tons.

NOCK, Albert Jay, American essayist, historian, and critic; b. 1873?; d. Wakefield, R.I., Aug. 19, 1945. An avowed Jeffersonian and an ardent disciple of Henry George, Mr. Nock wrote many provocative books and essays in which he championed individualism and condemned the present-day tendency toward statism. Among his books are *How Diplomats Make War* (1916; with Francis Neilson); *The Myth of a Guilty Nation* (1922); *Jefferson* (1926); *On Doing the Right Thing* (1928); *Francis Rabelais* (1929; with Catherine Rose Wilson); *The Book of Journeyman* (1930); *The Theory of Education in the United States* (1932); *A Journal of These Days* (1934); *Our Enemy, the State* (1935); *Henry George* (1939); and *Memoirs of a Superfluous Man* (1943).

NORFOLK ISLAND. A dependency of the Commonwealth of Australia, in the Pacific Ocean, 930 miles east of Sydney, New South Wales, and 630 miles northwest of Auckland, New Zealand. It is approximately five miles long and three miles in breadth, the area being 10.2 square miles; population (1940) 896. The climate is healthful and the soil fertile; lemons, figs, grapes, pineapples, bananas, and beans are cultivated, and the fishing is excellent. Kingston is the principal settlement. An administrator (Sir Charles Rosenthal) is assisted by an Advisory Council having 8 elected members. The island was discovered by Capt. James Cook in 1774. Between 1788 and 1805, and again between 1826 and 1855, Norfolk Island was a penal settlement for convicts transferred from New South Wales. In 1856 many of the inhabitants of Pitcairn Island were brought thither by the British government.

NORRIS, Charles Gilman, American author; b. Chicago, Ill., April 23, 1881; d. Palo Alto, Calif., July 25, 1945. Brother of the novelist, Frank Norris, and husband of the popular author, Kathleen Norris, Charles G. Norris wrote novels which dealt with controversial subjects of the moment. His best known works are *Brass* (1921), a novel dealing with modern marriage; *Bread* (1923), a book about women in business; and *Seed* (1930), a novel on birth control which sold 70,000 copies in its original edition.

Mr. Norris met his future wife, Miss Kathleen Thompson, in 1908, and they were married in New York the next year. During the First World War, he served as a major in the army. His first published novel, *The Amateur*, appeared in 1915. Other novels include *Salt* (1917); *Pig Iron* (1925); *Zelda Marsh* (1927); *Zest* (1923); *Hands* (1935); *Bricks Without Straw* (1938); and *Flint* (1944). He also contributed many short stories to magazines and wrote several plays which were produced by the Bohemian Club of San Francisco, of which he was a member.

NORTH BORNEO, British. See BORNEO.

NORTH CAROLINA. South Atlantic state, United States; one of the original thirteen states. Population (1940): rural, 2,597,448; urban, 974,175; total, 3,571,623. Land area, 49,142 square miles, divided into 100 counties. Chief cities, with 1940 populations: Charlotte, 100,899; Winston-Salem, 79,815; Durham, 60,195; Greensboro, 59,319; Asheville, 51,310; Raleigh, the capital, 46,897; High Point, 38,495; Wilmington, 33,407.

Chief State Officers, 1945.—Governor, R. Gregg Cherry; lieutenant governor, L. Y. Ballentine; secretary of state, Thad Eure; treasurer, Charles

M. Johnson; auditor, George Ross Pou; attorney general, Harry McMullan.

Judiciary.—Chief justice of the state supreme court, W. P. Stacy; associate justices, Michael Schenck, W. A. Devin, M. V. Barnhill, A. A. F. Seawell, J. Wallace Winborne, E. B. Denny.

Legislature.—The state's General Assembly (Senate, 50 members; House of Representatives, 120 members) convenes biennially in odd years.

Education.—At last report (1943-44), there were 3,512 public elementary schools (grades 1-8) in the state, with 19,754 teachers and 699,965 pupils. Public high schools (grades 9-12) numbered 980, with 6,174 teachers, and 133,650 students. Public elementary and high school teachers received an average yearly salary of \$1,120. Education in North Carolina is compulsory for all children between the ages of 7 and 14, inclusive. There are six teacher training schools in the state, three of them for Negroes. There is also Pembroke State College for Indians. Total state appropriation for education below college grade, and including administrative costs (1945-46), \$47,757,519; total estimated appropriation by cities and counties, \$6,000,000. State superintendent of public instruction, Clyde A. Erwin.

Finances.—Following is a statement of North Carolina's finances for the fiscal year 1944-45, supplied by the state treasurer's office:

Balance in treasury, beginning of fiscal year 1944-45	\$ 70,124,826.47
Receipts, 1944-45	401,575,457.07
Total	\$471,700,283.54
Disbursements, 1944-45	389,866,928.59
Balance, beginning of fiscal year 1945-46	\$ 81,833,354.95

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.)	47,516	51,524	54,512
Oats (1,000 bu.)	5,602	8,151	8,568
Wheat (1,000 bu.)	6,112	8,928	6,412
Barley (1,000 bu.)	428	1,170	922
Rye (1,000 bu.)	461	399	330
Cotton (1,000 bales) ..	604	710	430
Hay:			
Tame (1,000 tons) ..	1,003	1,121	1,309
Soybeans for beans (1,000 bu.)	1,922	2,058	2,088
Peanuts (1,000 lb.)	287,180	343,910	343,200
Pecans (1,000 lb.)	2,396	2,300	2,730
Sweet potatoes (1,000 bu.)	8,235	8,970	7,350
Tobacco (1,000 lbs.)	550,482	755,606	843,925
Potatoes (1,000 bu.)	8,778	8,970	8,424
Peaches (1,000 bu.)	1,892	2,698	2,172
Pears (1,000 bu.)	317	354	360
Grapes (tons)	6,150	6,600	3,700

NORTH DAKOTA. West North Central state, United States; admitted to the Union Nov. 2, 1889. Population (1940): rural, 510,012; urban, 131,923; total, 641,935. Land area, 70,054 square miles, divided into 53 counties. Chief cities, with 1940 populations: Fargo, 32,580; Grand Forks, 20,228; Minot, 16,577; Bismarck, the capital, 15,496.

Chief State Officers, 1945.—Governor, Fred Aandahl; lieutenant governor, C. P. Dahl; secretary of state, Thomas Hall; treasurer, Otto E. Krueger; state auditor, Berta E. Baker; attorney general, Nels Johnson.

Judiciary.—Chief justice of the state supreme court, A. M. Christianson; judges, Thomas J. Burke, A. C. Burr, James Morris, W. L. Nuessle.

Legislature.—The state Legislative Assembly (Senate, 49 members; House of Representatives, 113) convenes biennially in odd-numbered years, on the first Tuesday after the first of January.

Education.—Public elementary schools (as of June 30, 1944): one-room rural, 3,141; graded and consolidated, 204. Public schools which also include the elementary schools: fully accredited high schools, 87; minor accredited high schools, 90; three-year high schools, 21; two-year high schools, 64. Total number of elementary school teachers, 5,229; total number of high school teachers, 1,490. Total number of elementary school pupils, 90,371; high school pupils, 27,033. Average yearly salary of all public school teachers in the state, \$1,171. Education in North Dakota is compulsory for all children between the ages of 7 and 15, inclusive, or until the 17th birthday if the 8th grade has not been completed. There are 5 teacher training schools in the state. Colleges and universities receiving state aid: State Agricultural College, Fargo; University of North Dakota, Grand Forks; State School of Science, Wahpeton; State School of Forestry, Bottineau. Total state appropriation for elementary and high schools, \$1,875,000 (state equalization fund) and \$911,073.88 (state apportionment). State superintendent of public instruction, Arthur E. Thompson.

Finances.—The following statement of North Dakota's finances for the fiscal year 1944-45 was supplied by the state treasurer's office:

Balance in treasury, beginning of fiscal year 1944-45	\$33,377,409.03
Receipts, 1944-45	39,530,307.60
Total	\$72,907,716.63
Disbursements, 1944-45	40,397,140.42
Balance, beginning of fiscal year 1945-46	\$32,510,576.21

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

Crop (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.).....	19,280	36,250	26,664
Oats (1,000 bu.).....	40,050	82,041	83,266
Wheat (1,000 bu.).....	44,362	161,630	161,931
Barley (1,000 bu.).....	33,018	59,062	57,336
Rye (1,000 bu.).....	8,346	2,016	2,030
Flaxseed (1,000 bu.)...	4,415	7,661	12,328
Hay:			
Alfalfa (1,000 tons)...	163	293	272
Tame (1,000 tons)...	1,139	1,122	1,042
Wild (1,000 tons)...	1,334	2,060	1,761
Potatoes (1,000 bu.)...	13,249	20,875	23,010

NORTHERN IRELAND. See IRELAND.

NORTHERN RHODESIA. See RHODESIA.

NORTHERN TERRITORY. See AUSTRALIA.

NORTHWEST TERRITORIES. Official designation of the mainland portion of Canada lying north of the 60th parallel of latitude between Hudson Bay on the east and Yukon Territory on the west, together with the islands lying between the mainland of Canada and the North Pole including those in Hudson Bay, James Bay, and Hudson Strait. The area of the Territories is 1,309,682 square miles; the population, according to the 1941 census, was 12,028, including 2,284 whites, 4,334 Indians, 5,404 Eskimo, 6 others.

Government.—Government is administered from Ottawa by a commissioner, a deputy commissioner, and five councilors, appointed by the governor in council. For administrative purposes, the Northwest Territories have been divided into the provisional districts of Mackenzie, Keewatin,

and Franklin. The administrative headquarters for Mackenzie District is at Fort Smith. A government medical officer at Aklavik acts as administrator for the lower Mackenzie and Western Arctic regions. The main office for transaction of mining business is at Yellowknife.

Transportation and Communication.—Transportation in Mackenzie District is provided by air services in summer and winter, by river steamer services in summer, and by tractor roads in winter. All-weather roads in the vicinity of principal settlements also permit limited truck and motor traffic. Construction of an extension to the portage road along a hazardous stretch of Great Bear River to the outlet of Great Bear Lake was commenced in 1945. Completion of this road will help expedite shipments of concentrates from Eldorado Mine to railhead at Waterways, Alberta. An agreement was also negotiated between the Province of Alberta and the Dominion government for the construction in 1946 of an all-weather road from railhead at Grimshaw, Alberta, to Great Slave Lake, N.W.T. This road, when completed, is expected to facilitate the transportation of freight to Yellowknife and the lower Mackenzie Basin. Medical centers, trading posts, and other places in the Eastern Arctic are served by the annual supply ship from Montreal, and by auxiliary services from railhead at Churchill on Hudson Bay. Postal service is provided regularly throughout Mackenzie District by air, and radio communication is maintained the year round between points in the Territories and the provinces through government and private commercial radio stations.

Trade and Industry.—The fur trade and mining are the principal industries. A limited amount of fishing, lumbering, and agriculture is also carried on in Mackenzie District for domestic purposes. Fur-trading is controlled by regulation, and posts have been established by private enterprise throughout the regions tributary to the Arctic Coast, Hudson Bay, and the Mackenzie Basin. More than 750,000 square miles have been set aside as native game preserves for the exclusive use of the native population. The value of fur harvested in the Territories during the year ended June 30, 1944, has been estimated at \$1,510,500.

Mining.—Mining activity in the Mackenzie District in 1945 included the production of uranium concentrates, petroleum, and gold. Recent developments in atomic research, including the atomic bomb, have focused attention on the mine of Eldorado Mining and Refining on Great Bear Lake. This property—one of the world's principal sources of uranium and radium—was expropriated by the government of Canada in January 1944, and has since been operated at capacity by a crown company. Figures relating to tonnage of ore mined, milled and shipped to the refinery at Port Hope, Ontario, are treated as confidential.

The production of petroleum products at Norman Wells in the lower Mackenzie Basin declined, following suspension of Canol Project activities on March 8, 1945, at the request of the United States government. The pumping of crude oil through the pipeline from Norman Wells to White Horse, Yukon Territory, and operation of the refinery at White Horse was also discontinued. Sufficient wells were left in operation to meet the needs of the refinery at Norman Wells, which supplies the petroleum requirements of Mackenzie District. Explorative drilling is being continued in the Norman Wells region by Norman Exploration, a subsidiary of Imperial Oil, Limited.

Gold production was resumed in Mackenzie District with the reopening of the mill of Negus Mines, Limited, in July, 1945. Other mines, that temporarily suspended operations in 1942-43 as a result of labor shortages, are expected to resume milling in 1946. Explorative drilling and prospecting has been carried out on a large scale in the Yellowknife Mining District, where more than 15,000 claims were in good standing on Nov. 30, 1945. Many small, but rich gold discoveries have been made, and active development is being carried out on several of the more promising properties.

A broad program of field investigation was continued during the summer. This work included geological, topographical, horticultural, and geographical surveys, and an investigation of fresh-water fisheries. An addition to the settlement of Yellowknife was surveyed, roads in the vicinity were improved and extended, and the government administrative staff augmented to meet the requirements of a large increase in population.

R. A. GIBSON,
Deputy Commissioner, Northwest Territories.

NORWAY. A country of northern Europe which comprises the western and northern part of the Scandinavian Peninsula, an area of 124,556 square miles, and has an estimated population (1939) of 2,937,000. The country is divided into 20 provinces. The principal cities are Oslo, the capital, formerly known as Kristiania (est. pop. 1938, 275,000), Bergen (est. 1938, 106,500), Trondheim (1930, 54,458), Stavanger (46,780), and Drammen (25,493).

The beginnings of the Norwegian nation date back to 872. From the 15th century to the 19th Norway was united with Denmark. Copenhagen was the seat of the administration and of what might be called the official culture. Norwegians were required to use the Danish language. Principally as a result of the Napoleonic wars, in which Denmark sided with France, the Danish king was forced to renounce his right to the Norwegian crown at the Peace of Kiel, in 1814, in favor of the king of Sweden. Norway, however, refused to submit to this arrangement, and so a number of representative Norwegians met at Eidsvoll that same year and elected their own candidate for the crown. A constitution was drawn up at the same time and adopted. It was founded on the old Norse traditions and laws but had gained fresh impulse from the French Revolution and from the American War of Independence. Ever since then it has been the rock on which Norwegian life is founded.

The Eidsvoll negotiations were not allowed to achieve their object completely. The important European powers supported the Kiel agreement and backed the Swedish king in his claim to the throne of Norway. In due time, therefore, a compromise was reached, the chief feature of which was that the Norwegians should be a sovereign people, linked to the Swedes by a personal union only, with the Swedish king as the ruler of both.

Strained relations with Sweden lasted until 1905, when Norway's Parliament dissolved the union in behalf of the Norwegian people. A prince of the Danish royal house, Prince Carl, was elected king of Norway and came to the throne shortly afterwards, under the name of Haakon VII. According to the constitution of 1814, as modified at various times, legislative power was vested in the Storting, comprising the Lagting and Odelsting.

On April 9, 1940, Germany—without warning—launched a blitzkrieg invasion of Norway and Denmark. For 62 days Norwegian, British, French, and Polish troops fought on in Norway, but on June 17, King Haakon announced that further resistance on Norwegian soil would be impossible, that it would be necessary to evacuate the government to England. Headquarters then were established in London. On Sept. 25, 1940, Major Vidkun Quisling was appointed by the Germans as the foremost member of a puppet Cabinet responsible to the German Reich commissioner, Josef Terboven.

Agriculture.—During the period of German occupation (April 1940 to May 1945) many of the Norwegians learned to grow their own potatoes and tobacco, and developed many substitute foods. Following the Nazi collapse the Norwegian farms (representing only about 3.6 per cent of the area of this mountainous country) were reported to have been producing below their capacity because of diversion of manpower and lack of fertilizer. By June 1945, most of the land had been planted, and the crops were well advanced.

Dairy cattle had been reduced in numbers by about 15 per cent, and they were producing about 30 to 45 per cent less milk and butter than before the war owing to the cutting off of their supply of proteins. It was believed that Norway's dairy industry could be brought back to normal levels within a year.

Fisheries and Merchant Marine.—In the past, Norway depended largely on the income from a large merchant marine, her whaling fleet, and her fisheries to offset a somewhat meager agricultural and industrial production. During the German occupation, Norway's fisheries provided large quantities of food for herself, Germany, and other European countries dominated by Germany, in addition to relieving a serious fodder shortage by yielding quantities of fish meal for domestic livestock. The lack of boats, equipment, fuel and lubricants and proper food and clothing for the fishermen was aggravated during the occupation by the labor shortage; and by far the largest part of every catch was requisitioned immediately on landing by the Germans. In January 1944 it was reported that some 450 Norwegian fishing vessels formerly using gasoline had been converted to the use of producer gas. As soon as the Germans were expelled (May 1945) efforts were begun to restore the fishing fleet to its prewar capacity. In the meantime, cod, herring, and hake, leading products of the fishing industry, the best of which had for years been diverted to Germany, could now be used much more freely as meat substitutes in most Norwegian homes.

The Norwegian merchant marine, fourth in world tonnage prior to the war, supported about 4 per cent of the population. When the German armies invaded Norway about five sixths of the total merchant tonnage was in ports outside the country. All of these ships, including the entire tanker fleet of 220 to 240 ships, served the Allies during the occupation. Acting quickly after the German attack, the Norwegian government requisitioned for war service all Norwegian merchant ships; only those in German controlled ports or waters were unable to heed this order. The result was that the Allied fleet was immediately increased by more than 1,000 ships manned by some 25,000 experienced Norwegian seamen.

Industry and Labor.—Prior to the German occupation, industry furnished a livelihood for about 27 per cent of the population; and among the

leading industries, in addition to the fisheries, were lumber dressing, pulp and paper manufacturing, and the processing of chemicals and metals. Other products were textiles, clothing, shoes, and leather, most of them dependent on the country's abundant water power resources. Current statistics are unavailable.

Norway's productive forests, largely pine, covering 24.2 per cent of the country's land area, constitute its principal natural resource. During 1944, Norwegian forests continued to be heavily overcut because of heavy German demands for lumber of all kinds and the urgent need for fuel. In 1941-42 the felling program called for 14,000,000 cubic meters, approximately 40 per cent more than the annual growth and from 70 to 100 per cent more than the normal annual cut before the war. After the expulsion of the Germans (May 1945) most of the forests, particularly in the north, were found in relatively good condition, a circumstance attributed mainly to the fact that the invaders had been unable to find means of transporting much of the timber.

Textile and leather industries lacked raw materials formerly imported and were in serious condition. Clothing and footwear became extremely difficult to obtain in Norway.

Under the supervision of German officials, a voluntary work service was established under a Norwegian administrative council in June 1940. Later, however, the Germans introduced compulsory labor service, applying both to men and women. This step was taken because very few Norwegians availed themselves of the opportunity to work on German wartime projects—despite much increased wages. By 1944 many thousands of Norwegians had been drafted for service on German fortifications and industrial projects in Norway, Poland, Germany, Denmark, France.

Minerals.—Although Norway's mineral resources are important, consisting of iron ore, sulphur, pyrites, nickel ore and copper ore, mineral fuel deposits are small and the mining output showed a decline during the years prior to the invasion of Norway. The total value of mineral products in 1938 was 238,173,000 kroner, including ores, metals and alloys. The Germans attempted to increase the exploitation of pyrites, copper, molybdenite, and ferroalloys. Molybdenite has great military value and Norway is the only European country to produce this mineral of vital importance in the production of high-grade steel. After the liberation it was found that while the Germans had removed large quantities of valuable minerals, and had left much of the equipment in a worn-out condition, the industry had been left relatively intact.

Foreign Trade.—Statistics of Norwegian trade since the German occupation have not been made available, but according to German and Continental sources, the Reich took increased quantities of Norwegian fish products, wood pulp, lumber, and mineral products during the occupation. Domestic trade in 1943 was stagnant.

Communications.—Public highways in 1938 totaled 25,720 miles; and railways, state and private, 2,472. During the German occupation there was some work on highway construction entailing the employment of more than 32,000 Norwegians and several thousands of Germans. It is reported that the new highways were patterned after the motor highways of Germany.

Lack of fuel continued to cripple transportation and motorized shipping in 1944. By the middle of 1942 only about 10,000 motor vehicles of the 40,000 in use prior to the occupation remained

in use, most of them using substitute fuels, and toward the end of 1943 a Nazi decree ordered that all motor vehicles should be converted to producer gas or some other substitute fuel.

In January 1945 it was estimated that Norway, largely dependent on her maritime trade, would need new merchant shipping tonnage to the extent of 350,000 gross tons annually for the next ten years. Of the needed ships—including cargo liners, and many fruit ships—Norway itself, it was expected, would be able to build only about 50,000 tons per year.

Limited mail service to Norway was resumed in May 1945, and ordinary mail, parcel post and air mail in July.

Finances.—The budget for the fiscal year 1940-41, proposed before the German invasion in April 1940, indicated revenue and expenditures of 790,256,000 kroner as compared with revenue and expenditures of 624,631,000 kroner in the 1939-40 estimates. The total public debt on June 30, 1939, was 1,464,200,000 kroner, of which 596,400,000 kroner were held in foreign debt, and 867,800,000 kroner in internal debt.

About half of the total budget of the Royal Norwegian government in London during the last six months of 1943 (the first half of the 1943-44 fiscal year) provided for expenditures in behalf of Norway's armed forces.

The Armed Forces.—Before the occupation of the country by Germany in 1940, the army of Norway was a national militia in which service was universal and compulsory, commencing at the age of 18 and continuing to 55. Active service was for 84 days. The permanent forces in 1939 included 1,135 officers and 765 noncommissioned officers. The Norwegian Navy was designed almost solely for coastal defense.

During the occupation of Norway the country was "policed" by German troops. Most of the Norwegian Navy was destroyed during the first days of the German invasion, but after that time the navy was rebuilt to the point that before the end of the war in Europe it was considerably larger than ever before. In 1944 it included more than 55 vessels. This fleet operated in conjunction with the British and American fleets.

The army and air force also were very considerably enlarged following the establishment of the government in London in the summer of 1940.

Religion and Education.—Under the constitutional monarchy, the Evangelical Lutheran Church was established as the state church, and as such was maintained by state funds. But there was complete religious freedom. After the invasion the church unrelentingly opposed every expression of nazism.

Primary education (reported as of 1937-38) is free and compulsory. The school age, in urban areas, is from 6½ to 14 years, and from 7 to 14 years in rural districts. Thereafter, children attend an intermediate school (roughly equivalent to the American high school and junior college combined) for five years. This school is called a *gymnasium*. Advanced training in the sciences, classics, languages, the professions, theology, forestry, may be obtained at one of several institutions of higher learning, of which the chief is the University of Oslo in the capital city.

There are also technical high schools, agricultural schools and many special schools, including institutions for abnormal children and reformatories for neglected children.

Principal Events of 1945.—At the turn of the year, only a small fraction of Norway, the north-

eastern tip of the country, had been liberated. All the more important cities and provinces were still in German hands and were being prepared for fanatical defense. The German plan was to turn Norway into a northern pendant to the much-publicized "Alpine Redoubt," principally with a view to continuing submarine warfare from such formidable bases as had been established at Trondheim, Bergen, Tromsø, and Narvik, among other places.

Militarily, the progress of liberation was slow. In mid-January, Norwegian forces, in co-operation with the Russians, reported a substantial advance westward from the Finnmark bases taken in 1944, but the offensive soon came to a standstill owing to winter conditions and the systematic devastations carried out by the retreating Germans in a naturally difficult terrain. Plainly, the bulk of the country could expect liberation only from a large-scale operation in the west, or as a result of Germany's total collapse. Up to the last, it remained doubtful which strategy the Allies had decided upon and how the Germans would react to it.

Thus for the vast majority of Norwegians, there were a few more hard months ahead and spokesmen of the government-in-exile in London repeatedly drew attention to the grave plight of the homeland. The food situation in Norway, in the early months of 1945, was as bad as anywhere on the Continent, with the possible exception of Holland, and the Nazi terror increased in fury as defeat loomed nearer. On February 8, the chief of Quisling's Norwegian Gestapo, "General" Karl Marthinsen, was shot and killed by patriots, on his way to his office. In retaliation, the Nazis executed 38 Norwegian hostages, including several prominent personalities. Fourteen more were put to death in mid-March after saboteurs had blown up the railroad administration building in Oslo.

Meanwhile, Vidkun Quisling, anxiously watching the handwriting on the wall, engaged in desperate maneuvers to extricate himself from the trap of his own making. On January 28, he was received by Hitler and Ribbentrop, pleading with them for hours (1) not to give up Norway on any pretext, and (2) to grant greater autonomy to his puppet government. Back in Oslo, on February 1, Quisling had the Parliament Building solemnly "returned" to his government by the Germans, hoisting the Norwegian flag over it, in a comedy designed to impress the nation with his patriotism and increased authority. And on February 16, his protector, Reichskommissar Josef Terboven, publicly promised that the Germans would hold and defend Norway to the last man. On April 10 Terboven, flanked by an impressive array of German generals and police officials, reaffirmed this pledge at a mass meeting held in the auditorium of Oslo University.

But it was all to no avail and a few weeks later the collapse came with dramatic suddenness and finality. The course of events closely paralleled those in Denmark except in the final phase. On May 1 the underground began to come out into the open, with patriotic demonstrations and overt disregard for German authority. A proclamation by General Boehme, commander of all German forces in Norway, lamenting Hitler's death and pledging allegiance to Doenitz, received scant attention. On the night of May 2, a special task force of the Norwegian home front seized vital archives and records which the Nazis and quislings attempted to burn. There followed a few days of general uncertainty and anxious

suspense when it was learned that the surrender, on May 4, of the German forces in the Netherlands, Denmark, and northwestern Germany did not include Norway. As late as May 5 the Gestapo carried out mass arrests in Oslo, but the following day prisoners at Grini concentration camp and elsewhere were released through the intervention of a high Swedish police official, Harry Soederman, who had come to Oslo with German consent and played an important role in the transition period. On the morning of May 7, the home front went into action throughout the country, seizing public buildings and communications. Later in the day it became known that Germany had capitulated on all fronts, including Norway. Instantly jubilant crowds filled the streets, cheering the exiled king and singing patriotic songs. For a while it looked as though the Norwegian Nazis would continue resistance on their own as home front groups began a roundup of traitors and collaborationists, but better counsel prevailed and the Nazis laid down their arms practically without bloodshed.

Quisling himself surrendered on the morning of May 9, after a short-lived attempt to entrench himself in his palatial villa at Bygdøe, outside Oslo; he was immediately lodged in the central prison. Eight of his "ministers" were also arrested, but two others, Sverre Riisnaes and Jonas Lie, along with Norway's No. 1 war criminal, Henrik Rogstad, former chief of police, barricaded themselves in a fortified estate. Riisnaes eventually surrendered, while Lie and Rogstad committed suicide. The two most prominent Germans in the country, Terboven and his Gestapo chief, Wilhelm Rediess, blew themselves to bits with dynamite in the elaborate underground fortress which the Reichskommissar had built under Skaugum Castle, his headquarters.

On May 13 Crown Prince Olav, commander in chief of all Norwegian forces, and three Cabinet ministers arrived in Oslo aboard a British destroyer. Premier Johann Nygaardsvold and the rest of the Cabinet returned to their country on May 31. But King Haakon purposely postponed his triumphal homecoming until June 7, a date doubly significant for it was on that day in 1940 that he and his government had been forced to flee Norway and it was the 40th anniversary of Norway's secession from Sweden. In contrast with so many other exiled regimes, both the king and the Nygaardsvold government had managed to retain the fullest support of the home front throughout their five years of absence from Norway and they were given an equally spontaneous and enthusiastic welcome by the populace.

In conformity with Premier Nygaardsvold's oft-repeated pledge that the "London government" would step down as soon as Norway had been completely liberated, the entire Cabinet resigned on June 12. Parliament was reconvened on June 14. It was generally agreed that the new government should be recruited primarily from the ranks of the home front, but Chief Justice Paul Berg, who had headed the Norwegian underground during the occupation, proved unable to form a Cabinet satisfactory to all political factions. King Haakon then turned to the young mayor of Oslo, Einar Gerhardsen, left-wing leader of the powerful Labor Party, who shortly succeeded in forming a coalition government of all five political parties. Of fifteen Cabinet ministers, all but two had been active in the resistance movement within Norway. The two exceptions, Foreign Minister Trygve Lie and Defense Minister Oscar Torp, were retained from the preceding

"London government" to preserve continuity in two key posts. Two Communists were included in the new Cabinet, one of them being Mrs. Kirsten Hansteen, wife of the late Viggo Hansteen, who was the first Norwegian to be executed by the Gestapo; Mrs. Hansteen is the first woman ever to hold a Cabinet post in Norway. A general election was held on October 8. It gave the Labor Party a slight absolute majority in the Storting, with 76 seats out of 150. The Communists, who after a short-lived fusion with the Labor Party, made a separate bid at the polls, obtained 11 seats. The Conservatives won 25 seats, the Liberals 20, the Agrarians 10, and the Christian People's Party 8. On November 1, Mr. Gerhardsen reformed his Cabinet on an all-Labor basis.

On June 29, the Norwegian Parliament, by a vote of 104 to 4, restored the death penalty, abolished since 1875. This move marked the start of a thorough purge of quislings, some 17,000 of whom were in custody by that time. The first death sentence was imposed on a convicted Gestapo sadist, Reidar Haaland, on July 16; it was carried out on August 17, after Haaland's appeal had been rejected by the Supreme Court. With this precedent in everybody's mind, the trial of Vidkun Quisling himself opened on August 20 at the crowded Masonic Hall in Oslo. Quisling pleaded "not guilty" to all of the charges filed against him, but the prosecution easily established that he had conspired with Germany to bring about the invasion of April 9, 1940, that he was guilty of high treason, and that he was responsible for the deaths of hundreds of Norwegian patriots. The spectacular trial, attended by 150 press representatives, ended on September 10 with a death sentence for Quisling, who immediately filed an appeal to the Supreme Court. It was rejected, and Quisling was executed on October 24.

NOVA SCOTIA. Canada's most easterly province; area 21,068 square miles, of which 20,073 square miles are land area, and 325 square miles are fresh water. Population (1941), 577,962. The principal cities with their 1941 populations are Halifax (70,488), Sydney (28,305), Glace Bay (25,147), Dartmouth (10,847), Truro (10,272), and New Glasgow (9,210). The first permanent settlement in Nova Scotia was made by the French early in the 17th century, and the province was called Acadia until it was finally ceded to the British by the Treaty of Utrecht in 1713.

Government.—The legislature of Nova Scotia consists of a lieutenant governor, appointed and paid by the Dominion government for a term of five years, and a House of Assembly of 30 members, chosen by popular vote for a term not exceeding five years. The province is represented in the Dominion Parliament by 10 Senators and 12 members of the House of Commons.

Education.—Education is free, compulsory and nondenominational. In addition to elementary and high schools, there are schools for the blind and the deaf, a provincial agricultural college and a normal college for the training of teachers, both at Truro, and a provincial technical college at Halifax.

Principal Events.—Nineteen forty-five and the end of the Second World War brought Nova Scotia, in common with the world at large, face to face with reconversion problems. The province's capital and largest city, Halifax (estimated pop. 1945, 100,000), which during the long years of

war had been the port of sailing for the Canadian Army in Europe, assumed during the latter part of the year, a reverse role as a port for happy homecoming veterans. Scores of thousands had arrived back in Canada through Halifax by the year's end.

War plants, which included aircraft assembling and repair factories, gun and shell plants, steel mills, and shipyards, closed down or curtailed activities. At Halifax shipyards work continued on three destroyers for the Canadian Navy while a fourth was commissioned and put in service. Many industrial plants, particularly those making railroad equipment and supplies, received new orders which continued to keep them busy.

Nova Scotia coal miners, affiliated with United Mine Workers of America (CIO), pressed for and obtained a wage increase which the coal companies met by a 33-cent jump in the price of coal per ton. A federally appointed royal commission spent several months investigating problems of Nova Scotia's coal industry along with the coal trade in the rest of Canada, but late in the year its findings had not been made public.

New developments in the province's long depressed fishing industry were foreseen with the amalgamation of several of the larger fish companies in a heavily capitalized organization titled National Sea Products, Limited. During the war years fish prices had been good and there had been a market for all the fish that could be caught.

For fruit growers of the Annapolis Valley, however, the picture was not so bright. Frosts early in the season cut the crop to the smallest harvest in recent years.

In the political sphere one of the most notable events was the return to the provincial premiership of Hon. Angus L. Macdonald, who headed the Liberal government from 1933 to 1940, when he joined the Mackenzie King cabinet at Ottawa as navy minister. He came back to his native Nova Scotia in 1945 to succeed Premier A. Stirling MacMillan, 74, who retired after more than 40 years in public life. In October, Premier Macdonald's government was re-elected with an increased number of supporters in the Assembly in a provincial general election.

Important development in the field of education was the provincial government's decision to give large-scale financial assistance in the establishment of a system of rural high schools and vocational schools in Nova Scotia.

In mid-July fire set off a series of explosions in a naval arsenal just outside Halifax which rocked the area for a night and a day. Many buildings were damaged and almost the entire northern half of the city and suburbs was evacuated. Fortunately the death toll was small.

GEORGE E. HERMAN,
Acting Director, Bureau of Information and Publicity, Halifax, Nova Scotia.

NUCLEAR PHYSICS. See under PHYSICS.

NURSING, Wartime, 1941-45. The story of wartime nursing is one of essential service rendered by close to 300,000 registered professional nurses on both the military and the civilian fronts. Between Pearl Harbor and V-J Day, over 76,000 nurses had served with the United States' armed forces in this country and in major theaters of operation. Their competent care of the sick and injured at home and abroad, in zones of combat and on trains, planes or ships, contributed in no small measure to the all-time low death rate of 3 per 100 which was achieved for American

wounded in the Second World War. Typical of the valor and courage of army and navy nurses is a brief account of "That Good Soldier—the Army Nurse" in a pamphlet published by the Information and Education Division, European Theater of Operations, United States Army (ETOUSA), entitled *That Men Might Live*. An excerpt follows:

"One recipient of speedy evacuation opened his eyes for the first time after being hit, to look into the smiling face of Capt. Beth Veley, San Jose, Calif., Chief Nurse, 103rd Evacuation Hospital. 'You shouldn't be up this far', the wounded lieutenant said. He didn't know he was talking to a veteran of two sieges. Captain Veley was one of the last nurses off Bataan and a month later was aboard the last plane out of Corregidor.

"Nurses were injured and killed as they attended fighting men. One morning Lieut. Frances Slanger, Boston, wrote the *Stars and Stripes* her impressions of the American soldier. She penned 'The Wounded Do Not Cry. Their buddies come first. The patience and courage they have is something always to behold.'

"A German shell burst in the area and fragments struck Lieut. Slanger. 'I am dying' she said quietly as she was taken to the operating tent. She died one half hour later as calmly and as bravely as the men she had nursed and written about.

"Lieut. Slanger was the first American nurse to die from enemy action in the ETO. She and her companions had waded ashore in Normandy on D-Day plus 4. Without stopping to change their clothes, the nurses went on duty in a field hospital."

Of the more than 76,000 army and navy nurses who served in the war, close to 1,000 received decorations and citations for distinguished service, courage and devotion beyond the call of duty.

On the home front, nurses gave equally effective though less spectacular service. The departure for military service of thousands of young nurses, coupled with increased birth rates among civilians, threats of epidemics, and rises in incidence of such diseases as tuberculosis, diphtheria and infantile paralysis, necessitated careful planning and adjustments to make the available supply of nurses go around.

The federal government gave generous support to the nursing profession in its effort to meet the growing need for nurses. Congress appropriated over \$175,000,000 during the war period for nursing education to increase the number of students enrolled in schools of nursing and to enable more graduate nurses to prepare themselves for responsible positions in hospitals, schools of nursing, and in the field of public health. The War Manpower Commission, after declaring nursing an essential war service, established a nursing section in its Procurement and Assignment Service to aid in the equitable distribution of nurses among military and civilian services. The Office of War Information permitted its radio and press facilities to be used to recruit nurses for military service, and to bring home to the public the urgent need for nurses.

The nursing profession geared itself for war service months before the Japanese sneak attack on Pearl Harbor. By organizing the Nursing Council on National Defense in July 1940, which became the National Nursing Council for War Service in 1942, it established a mechanism for co-ordinating the activities of professional nursing organizations so that the nation's need for

nursing service might be most usefully and effectively met.

Close co-operation between government agencies and professional nursing organizations in making known the country's urgent need for nursing, resulted in a magnificent response from nurses, young and old. Over one third of the profession volunteered for military service. Thousands of nurses who had retired from active nursing because of age, health or home responsibilities, donned uniforms and helped to care for patients in hospitals and homes for several hours a day or several days each week. Thousands of nurses in full-time jobs devoted large portions of their spare time evenings, weekends, and holidays to such volunteer activities as classifying nurses as part of the procurement and assignment program of the War Manpower Commission; recruiting nurses for military service, and students for schools of nursing; teaching Red Cross classes in home nursing, and of volunteer nurse's aides; and organizing nursing units in the emergency medical services of the Office of Civilian Defense. As a result of all these efforts, military needs were met, essential civilian nursing services were maintained; enrollments of nursing schools increased from 87,588 in 1941 to 126,576 (110,068 of them members of the Cadet Nurse Corps) in 1945; close to one million housewives, high school girls and some fathers completed classes in home nursing sponsored by the American Red Cross; and over 180,000 volunteer nurse's aides were certified for service in hospitals and public health nursing agencies.

With hostilities ended, the nursing profession rapidly began converting to a peacetime program. Through the National Nursing Planning Committee of the N.N.C.W.S., an over-all plan to provide nursing service at a high level of competence for all people is rapidly taking shape. A National Professional Counseling and Placement Service is being developed by the American Nurses' Association to provide educational and vocational counseling for nurses seeking guidance or positions. Advanced clinical courses are being established in colleges and universities to prepare qualified graduate nurses as specialists in such clinical services as psychiatric, pediatric tuberculosis, orthopedic and obstetric nursing. Provision of scholarship funds by government and private organizations is encouraging nurses to seek special preparation for responsible positions in hospitals, health agencies and nursing schools.

Wartime advances in industrial medicine and nursing have given labor a new appreciation of health. The superb medical care provided for the armed forces and the government maternity and infant welfare program for their families have set a new standard of medical care which veterans will not forget. These groups will demand, and rightly so, that facilities for good medical care shall be more equitably distributed throughout the nation. Nursing service will continue to be an essential factor in the American way of life.

ERNESTINE WIEDENBACH,
Secretary, Nursing Information Bureau, American Nurses' Association.

NUTRITION. During 1945, investigation of nutritional problems, both basic and applied, continued on a large scale with many of the problems directly related to the war. Only a brief account of a few of the advances can be presented in this review.

Human Requirements.—The recommended dietary allowances of the Food and Nutrition Board

of the National Research Council (see 1943 *AMERICANA ANNUAL* under *Nutrition*) have been revised. Some of the recommendations have been decreased. The revised table is as follows:

fed, a large percentage of the nitrogen will be excreted in the urine; therefore, the proteins will have low biological values. Although there are exceptions, most vegetable proteins have lower

RECOMMENDED DIETARY ALLOWANCES

Revised, 1945, Food and Nutrition Board, National Research Council, Washington, D. C.

	Calories	Protein grams	Cal- cium grams	Iron mg.	Vita- min A I. U.	Thia- mine mg.	Ribo- flavin mg.	Niacin (Nico- tinic acid) mg.	Ascor- bic acid mg.	Vitamin D I. U.

The most significant changes are a reduction of the recommended allowances for the B-complex vitamins, riboflavin, niacin, and thiamine, particularly at higher caloric intakes. It should be stressed again (see 1945 *AMERICANA ANNUAL* under *Nutrition*) that the figures in the above table are *recommended dietary allowances* and *not* nutritional requirements. With all of the levels there are ample margins of safety to account for the multitude of environmental factors which affect actual requirement of specific nutrients. As well as can be evaluated, human health is perfectly normal at levels of nutrients somewhat less than these recommendations, but they still serve as a guide for good nutrition and the levels are easily obtained from an intelligent selection of foods.

The shortage of meat and other animal proteins has continued to focus interest on the nutritional qualities of various vegetable proteins and on the amino acid requirements of man. In evaluating proteins, one must consider two general aspects: (1) digestibility, and (2) biological value. By digestibility is meant the per cent of the consumed protein, measured in terms of nitrogen, that is absorbed. Biological value means the per cent of absorbed nitrogen that is retained by the body and not excreted in the urine. The body requires a definite combination of amino acids each in proper amount for the formation of tissue proteins. If any essential amino acid is supplied in inadequate amounts, then this amino acid will determine the amount of tissue protein made; other amino acids, regardless of the amount present, can be used only to the extent that is required for this tissue protein and the rest present will be metabolized and the nitrogen excreted in the urine. Thus if proteins containing small amounts of any of the essential amino acids are

digestibilities and biological values than animal proteins. For this reason, most nutritionists recommend that diets contain some animal protein. Recent evidence, however, suggests that even on all-vegetable diets the protein intake will be satisfactory for adults if sufficient food is provided to satisfy the caloric requirement. In a study with young men fed diets containing only 50 to 55 gms. of protein, of which 90 per cent or more was from vegetable sources, no changes in physical fitness or efficiency were found during a two-month experimental period. The protein intake in these diets was as low as possible without resorting to the use of large amounts of nitrogen-free constituents to maintain adequate caloric intakes. These data, as well as observations on the nutritional status of the civilian population in various European countries short of food as a result of the war, suggest that protein deficiency in adults is most unlikely on diets of natural foods which are adequate in calories. This may not be true in children for it is known that protein metabolism in growth is very inefficient and requirements are three to four times higher than in maintenance of nitrogen equilibrium in the adult.

Food Composition.—The war has stimulated interest in food composition and the effect of processing and storage on the nutrient content. To correlate studies in different laboratories on analytical methods, analysis of foods, and losses of nutrients during processing and storage, the Food and Nutrition Board has had a Committee on Food Composition. The results thus far available have been presented in two mimeographed reports entitled *Tables of Food Composition Giving Proximate Mineral and Vitamin Components of Food and Vitamin Losses in Cooking Foods*. Reports have appeared on an extensive investigation into the nutritive value of canned foods. While

there are certain losses in some nutrients during canning procedures, particularly in ascorbic acid and thiamine, canned foods are of high nutritive value.

The merits of white bread made from enriched flour versus whole wheat bread continue to be discussed. The latter is a superior product from its composition of nutrients because it is somewhat richer in protein, B-complex vitamins, iron, and calcium. However, whole wheat flours also contain certain substances such as fiber and phytic acid which interfere with the absorption of some nutrients. From a practical viewpoint, this must be recognized as well as the fact that most people prefer white to dark bread and food habits are important in determining what we eat. The enrichment of white flour with thiamine, riboflavin, and niacin is a definite and positive step in the improvement of dietaries and of public health.

The effect of commercial processing on the nutritional value of proteins in foodstuffs has been of interest. Heat is the factor causing the most change, and much data on the effect of heat on food proteins have been collected. Too great a heat will decrease the value of any protein, but a moderate degree of heat may have no effect or increase it or decrease it. It is known that moderate heating increases the biological value of soybean proteins. Dry heat during processing impairs the growth-promoting value of wheat, rice, oat, and corn proteins. So-called "puffed cereals" prepared by preheating with steam under high pressure, followed by suddenly releasing the pressure, is especially destructive. This impairment is not one of lowered digestibility but rather to a lowered utilization of the protein possibly as the result of destruction of certain essential amino acids.

Nutrition Surveys.—Two nutrition surveys in Newfoundland, carried out by independent investigators, are of interest in that a careful attempt was made to evaluate the health of the individuals by means of physical examinations and laboratory studies and to correlate these findings with the dietary findings. In one survey, 868 unselected people in St. John's and several outlying towns were studied. The dietary and laboratory findings suggest that these individuals subsist at a definitely lower intake level than the population of Canada and the United States. A high incidence of minor physical changes was reported which are suggestive of deficiencies of vitamin A, riboflavin, and ascorbic acid. In the second survey, 113 individuals were examined in a small west coast fishing village. The subjects were largely selected to include those most susceptible to nutritional deficiency—namely, pregnant and lactating women and rapidly growing children. Multiple nutritional deficiencies were reported in over half of the subjects. Those most frequently encountered were of vitamin A, riboflavin, and iron.

A previous review (see 1945 AMERICAN ANNUAL under *Nutrition*) mentioned a nutritional survey in a California aircraft factory which reported that 40 to 50 per cent of the workers had symptoms and complaints suggestive of poor nutrition though it was not proved that dietary deficiency was the primary cause. A further report on this same study has been made which gives analyses of absenteeism, turnover, and personnel ratings on three groups of workers as follows: a group receiving vitamin supplements, a group receiving a placebo supplement (pills containing no vitamins), and a control group receiving no supplement. Only slight differences were observed among the three groups. The results reported

could not be accepted as a basis for advising general vitamin supplementation for the industrial worker.

Nutritional Rehabilitation.—There has been and will continue to be much interest in the nutritional condition of the people, particularly the children, of war-torn countries, and with the treatment of starvation. Studies have been made on the nutritional condition of children in France, and it was concluded that probably half of the children of school age had suffered a retardation of growth. Signs of general malnutrition, chronic fatigue, and lack of physical fitness were reported. The decrease in growth rate was attributed to three main factors—lack of calories, of protein, or of vitamin D. Nevertheless, none of the specific nutritional deficiency diseases, other than rickets, appears to have developed with greater frequency than under prewar conditions.

Studies on nutritional conditions in Holland in the first few days following the end of the war revealed a severe state of general malnutrition among the civilian population of the large cities. Marked weight loss, edema, anemia, and deficiencies of vitamin A were common. Caloric intakes were grossly deficient, being reported at less than half of what is desirable.

Food conditions in Europe improved greatly shortly after the war with the coming of spring and summer crops and the release to civilians of certain army food supplies. However, it is most likely that much hunger and starvation will appear in war-torn countries during the next one or two winters. This will not be due so much to a real shortage of food as it will be to inadequate transportation and distribution of food from the country to the cities.

Nutrition and Protection Against Toxic Chemicals.—There has been increasing interest in the effect of diet on the toxicity of drugs and a mounting realization that proteins constitute an effective protective agent against a wide variety of toxic compounds. Diets rich in protein have been shown to exert a beneficial influence when given to experimental animals exposed to chloroform, carbon tetrachloride, benzene, arsphenamine, mapharsen, or atabrine. In certain concentrations these drugs damage the liver. It was formerly thought that protection of the liver was best afforded by a high carbohydrate diet; however, the striking protective action of dietary protein has focused attention on the latter. It appears that the sulphur-containing amino acids, methionine and cystine, are the principal components of protein that are effective in this protective action, though the actual detoxifying mechanism is not known.

Nutrition Reviews.—Attention is directed to the monthly journal, *Nutrition Reviews*, published by the Nutrition Foundation, Inc., Chrysler Building, New York City. *Nutrition Reviews* presents an authoritative, unbiased review of the world's current research literature in the science of nutrition, particularly as it relates to health. It is also translated into Spanish and is published under the name of *Nutricion* by La Prensa Medica Mexicana, Queretara 97, Mexico, D.F.

and Department of Biological Chemistry, School
of Medicine, Harvard University, Boston, Mass.*

NYASALAND PROTECTORATE. A British territory in southeast Africa, along the western and southern shores of Lake Nyasa and extending

southward almost to the Zambezi River. The land area is 37,374 square miles, and the population at the end of 1940 numbered 1,686,045 (1,682,456 natives, 1,738 whites, and 1,851 Indians). The capital is Zomba, in the Shire Highlands, where also are Blantyre and Limbe, centers of white settlement; ports on Lake Nyasa include Karonga, Bandawe, Kota Kota, and Fort Johnston. A governor (Sir Edmund Richards appointed June 5, 1942), assisted by nominated executive and legislative councils, administers the three provinces into which the country is divided (the Central Province was constituted in 1945 from parts of the Northern and Southern provinces); provincial councils of chiefs and other responsible Africans are associated with local administration. The 1945 budget estimated revenue of £778,851 and grants from the British Treasury of £267,378, a total of £1,046,229; expenditure was placed at £1,030,769, showing an estimated surplus of £15,460. State aid is provided for elementary schools for natives conducted by 11 missionary bodies (4,070 schools with 183,242 pupils in 1943); the government also finances 2 secondary schools for Africans and aids 4 schools for white children. A five-year program for extension of educational facilities was initiated in 1945 with a grant from the British treasury of £345,000.

Land holdings of white settlers constitute 5.5 per cent of all land in the protectorate. Both white farmers and natives cultivate tobacco (13,000,000 pounds exported in 1944), and the for-

mer also grow tea (19,100 acres in 1942 and exports of 12,382,404 pounds) and small crops of coffee (once the chief article of export), tung, and pyrethrum, the last being first cultivated during the war. The 1945 tobacco crop was estimated at 11,500,000 pounds, of which 2,250,000 pounds represented native production. Natives also grow cotton (3,737,116 pounds exported in 1942), rice, corn (maize), and peanuts. A joint development adviser for the protectorate and Northern Rhodesia was appointed in 1945. The principal imports are cotton textiles, vehicles, machinery, and petroleum products. Total imports in 1943 were valued at £1,276,322, and exports at £1,379,401. A railroad line connecting the protectorate with the sea extends southward from Salima to Blantyre (160 miles), Port Herald (259 miles), and Sena (324 miles), crosses the Zambezi River by the longest railroad bridge in the world (2.285 miles), and continues on to Beira in Mozambique (524 miles). A steamship service on Lake Nyasa is operated by the protectorate's railroad administration. There is a good highway system of 3,733 miles; it connects with the Great North Road, which extends from South Africa to the headwaters of the Nile. A road completed in 1945 from a point six miles south of Dedza, on the main Lilonge highway, to the railroad near Golomoti reduces by 50 miles the haul for export products from the Angoni Highlands. Scheduled air transport services link the protectorate with North and South Africa.

OATS. The 1945 oat crop of the United States was estimated by the Department of Agriculture on October 1 at 1,583,650,000 bushels, as compared with the 1944 crop of 1,166,392,000 bushels and the 1934-43 average crop of 1,068,399,000 bushels. Minnesota was the leading producing state in 1945 with a crop totaling 243,938,000 bushels. Iowa was second with 222,794,000 bushels, and Illinois was third with 165,216,000 bushels.

OCEAN ISLAND. See WESTERN PACIFIC ISLANDS, BRITISH, Section 2.

OCEANIA. Geographically, the land division of the world which is composed of islands in the Pacific Ocean; in the more restricted general usage, the term comprehends Melanesia and the greater part of Polynesia. Politically, French Oceania comprises possessions of France. The Western Pacific Islands and the Fiji Islands are under British administration, and the New Hebrides is a Franco-British condominium; New Guinea is divided between the Netherlands and Australia, and Samoa between the United States and New Zealand; Tokelau (or Union) Islands, the Cook Islands, and the Niue are dependencies of New Zealand; and Nauru is a mandate of the British Empire. See separate articles on the various territories.

O'DWYER, William, mayor of New York City: b. Bohola, County Mayo, Ireland, July 11, 1890. Mr. O'Dwyer was elected mayor of New York City Nov. 6, 1945, by a record plurality of 685,175 votes. He was swept into office by a

coalition of the Democratic and Left wing American Labor parties. He began his four-year term on Jan. 1, 1946. Mr. O'Dwyer was graduated from St. Mathy's secondary school and studied two years at the University of Salamanca, Spain, before coming to the United States in 1910, a near-penniless immigrant. He became an American citizen in 1916. One biographer has called his first seven years in America, 1910-17, his "odd-job years." His second seven, he worked as a New York City policeman, and studied law at Fordham University. Admitted to the bar in 1923, he entered general practice. He was a city magistrate from 1932 to 1938 and by appointment was a judge of the Kings County Court from 1938 to 1939. Elected District Attorney of Kings County, N.Y., in the fall of 1939, he took office Jan. 1, 1940, and in the 23 months he held that post, came into national prominence as the prosecutor who smashed Brooklyn's Murder Inc., and in the process, solved some 87 murders. He won the Democratic mayoralty nomination in 1941, but lost to Mayor Fiorello LaGuardia by 134,000 votes. After Pearl Harbor, he took leave of absence and volunteered for army service. He was commissioned major in June 1942, and by August 1944, had risen to the rank of brigadier general. Most of his army work had to do with the investigation of war-contract frauds. He also served as the late President Roosevelt's personal representative on the Allied Control Commission in Italy, and was executive director of the War Refugee Board. After V-E Day, he returned to Brooklyn as a civilian, and received the Democratic and American Labor

mayorality nominations in August 1945. He resigned as District Attorney—he had been re-elected in absentia in 1943—to carry on his political campaign.

OFFICE OF CIVILIAN DEFENSE (OCD). Established May 20, 1941, by President Roosevelt because of the rising menace of aerial attack upon the United States, the Office of Civilian Defense was the first of the war agencies to be abolished in the reconversion to a peacetime society. Its abolition became effective June 30, 1945, after more than four years of existence during which approximately twelve million civilians were organized and trained for protection against air raids and for the performance of other volunteer war services. Although the air raids did not occur, the civilian defense volunteers operated not only as insurance against such eventuality, but also they performed invaluable service in natural disasters, wrecks, and other war-related emergencies and disasters.

The States War Inspection Service (SWIS) continued during the first six months of 1945 to provide assistance to war plants and essential industrial facilities in matters of safety precautions against fire and other forms of sabotage and accidents.

On June 5, 1945, Executive Order 9562, formally abolishing the Office of Civilian Defense as of June 30, was issued. All of its functions also were abolished, with the exception that the protective property acquired by the Office of Civilian Defense was transferred to the Department of Commerce. The jurisdiction of the director of Civilian Defense with respect to such property was transferred to the Secretary of Commerce to be exercised subject to the Surplus Property Act of 1944 and the regulations of the Surplus Property Board. Liquidation of the general administrative activities was transferred to the Bureau of Accounts, Treasury Department. With the close of business, June 30, 1945, the United States Office of Civilian Defense ceased to exist.

ELWYN A. MAUCK,

Chief, Reports and Awards Office, OCD.

OFFICE OF DEFENSE TRANSPORTATION (ODT). Created by executive order at the beginning of the war and charged by the president with coordinating the nation's transportation plant to the winning of the conflict, the Office of Defense Transportation, due to the surrender of Germany and Japan, was, late in 1945, able to lift virtually all its controls over transportation. Under director Col. J. Monroe Johnson, the ODT in 1944 and 1945 continued to enforce existing transportation regulations; imposed new restrictions on the use of railroads, highways, waterways and pipelines; acted as claimant agency in obtaining, from the War Production Board, materials used in the manufacture of transportation equipment; and utilized the aid of already-established civilian advisory committees until the end of hostilities made their dissolution possible. With the collapse of Germany in May, the emphasis of the war shifted from the Atlantic to the Pacific theater. Much of the war freight movement had to be reversed to move overland to West Coast ports. Meanwhile the redeployment of troops and supplies from the Atlantic to the Pacific, by way of the American continent, placed an added burden on the already overloaded rail lines.

Railroads.—The ODT railroad program for the first half of 1945 was a continuance of existing controls over freight traffic and the placing of additional and more drastic restrictions on passenger

traffic. After V-J Day many of these controls were dropped or relaxed, pointing to the practical disappearance of the agency's activities by the end of the year. Maximum loading requirements for merchandise and bulk freight, and for perishables carried in refrigerator cars, were still in effect in October. To insure an adequate supply of box cars and refrigerator cars, as successive emergencies arose, temporary and local embargoes were placed on the railroads by the Interstate Commerce Commission on ODT recommendation and penalty demurrage charges, from time to time, were imposed.

The blizzard in the Northeast early in 1945 called for emergency measures to relieve congestion in that region; later, special efforts were made to supply the grain belt with the box cars needed to handle the 1945 bumper crop. The control exercised over the routing of railroad freight west of the Mississippi, under W. F. Kirk, western railway transport director, was maintained with successful results until November 1, when it was terminated.

The export permit system, controlling shipments of freight consigned to overseas destinations, continued to prevent congestion on rail lines leading to the ports until it was abolished in October.

To conserve passenger equipment at a time of prodigious troop movements by rail, ODT carried on until after V-J Day a vigorous campaign to cut down civilian passenger travel. By radio, posters, press publicity and through the co-operation of local committees, the "Spend your Vacation at Home" idea was brought to the people.

In October, the Toledo, Peoria and Western Railroad, which had been operated by the ODT since early in 1942, was restored to private operation. The Illinois Central Railroad was taken over by the ODT in August 1945 following an unsettled labor dispute. W. F. Kirk was appointed federal manager but the railroad continued operation without change of personnel.

Serious railroad manpower shortages on the west coast occupied the attention of ODT officials throughout the year and became more acute toward the end of 1945, due to heavy troop arrivals from the Pacific theater. The ODT joined with the army and other war agencies to promote a railway manpower recruiting campaign. Special deferments for railroad workers were obtained from Selective Service and the army released a number of experienced railroad workers to help meet the emergency.

Waterways.—The first half of 1945 saw a sustained volume of bulk commodities—petroleum and its products, iron ore, limestone, coal, grain and sulphur—moving on the nation's waterways under ODT supervision, as well as the building, under ODT sponsorship, of an additional fleet of steel tank barges necessary to care for mounting demands. The end of the war with Germany, in May, caused a slight reduction in the first half year's movement of iron ore on the Great Lakes. Shortage of railway equipment and other factors, however, increased the late grain volume by nearly nine million bushels over that of 1944. On the Mississippi-Ohio system, on the Gulf and Atlantic Intracoastal Canals and other inland channels, the volume of petroleum and its products totaled more than a million barrels a day. By co-operative agreement, a large segment of this 1945 movement was made jointly with railroads and pipelines. During the entire war period, inland waterways handled a grand total of 1,731,034,485 barrels of petroleum and its products; 345,835,040

tons of iron ore; 62,827,283 tons of limestone, as well as enormous quantities of coal, grain, sulphur and other bulk commodities. Termination of hostilities in the Pacific enabled ODT to remove completely its controls over the chartering, sale, leasing, loading, routing and operation of inland craft. On November 29, however, the ODT took over the Great Lakes Towing Company—serving virtually all lake ports—whose crafts had been rendered idle by a strike.

Liquid Transport.—Continuing its supervision over the movement of liquid products, the ODT during the first five months of 1945 expedited rail shipments by imposing extra demurrage charges on idle tank cars, by requiring daily telegraphic reports as to the loading and status of every car and by requiring loading and unloading crews to work around the clock. Largely as a result of these actions, a greater volume of petroleum and its products, vital to the armed forces and to civilian needs, was moved to the Atlantic Seaboard during the first quarter of 1945 than during any comparable period in history—166,323,838 barrels. During the second quarter of 1945 the volume decreased slightly due to the ending of the war with Germany. All ODT controls over the shipment of all liquids were lifted Sept. 20, 1945.

Highway Transport.—In the field of highway transport, ODT, during the latter half of 1945, lifted numerous restrictions which had been imposed to aid the flow of war matériel and manpower to the front. Among these were measures restricting the operations of solid fuel carriers and local bus, trolley, and school bus operation. Up to October 15, the ODT had returned to private operation 78 of the 103 midwest trucking concerns it had seized in August 1944 to prevent disruption of service during labor disputes. On August 16, 1945, it also terminated its control over more than 1,600 property transportation lines in Chicago and vicinity, taken over for the same reason, on May 23, 1945.

On November 21, the ODT assumed control of the property of the Capital Transit Company, operating street cars and buses in Washington, D.C., and suburban territory. The action was taken at the direction of President Truman, following two strikes within a period of two weeks. The activities of the Highway Transport Department were terminated as of December 1.

Controlled Materials Plan.—The War Production Board's Controlled Materials Plan terminated September 30. Under this plan ODT, as claimant agency, reported the production of certain major items during the operation of the plan in the three-and-a-half years ended June 30, 1945, as follows: 1,082 steam, 1,741 Diesel electric, 38 electric locomotives; 155,002 freight cars, 1,200 troop sleepers and 400 kitchen cars; 181,146 trucks and tractors; 19,580 integral buses; 5,572,392 tons of replacement rail. Production of these items was carried under free market conditions after September 30. One thousand two hundred more troop sleepers and 400 kitchen cars built under ODT sponsorship were scheduled for completion by the end of 1945 and production of passenger train cars—the first authorized since 1942—was scheduled to begin late in 1945 with 750 due to be built by July 1, 1946.

Reductions and Discontinuances.—Gradual reduction of the ODT staff and field offices (begun late in 1944), continued in 1945 and was greatly accelerated after V-E and V-J Days. The remaining 103 district offices and 39 field offices of the Highway Transport Department were liquidated in successive stages by November 1. The eight

remaining regional offices closed December 1. Fourteen Railway Department field offices were closed by November. Staff offices in Washington were reduced to skeleton strength necessary to close out operation of the various divisions by the end of the year.

By November, more than 23,000 special ODT advisory committees in different fields of transportation, were dissolved. These committees, whose members numbered 102,917, serving without compensation, co-operated with the ODT in gathering information, formulating policies and executing various industry and joint-action plans designed to get the fullest utilization of all transportation equipment in the interest of the war effort.

GARNETT L. ESKEW,
Information Manager, ODT.

OFFICE OF ECONOMIC STABILIZATION. This office was established within the Office for Emergency Management on Oct. 3, 1942, by Executive Order 9250, to control as far as possible inflationary tendencies which would impede prosecution of the war and the operation of the domestic economy. The same order established the Economic Stabilization Board to advise the director of the office.

The director was authorized to formulate and develop a comprehensive national economic policy for the control of civilian purchasing power, prices, rents, wages, salaries, profits, rationing, subsidies, and related matters.

Under Executive Order 9620, Sept. 20, 1945, the Office of Economic Stabilization was abolished and all functions and authority were transferred to the Office of War Mobilization and Reconversion. Within the Office of War Mobilization and Reconversion was established the Office of Stabilization Administrator. The functions and authority of the director of Economic Stabilization, transferred under Executive Order 9620 to the director of the Office of War Mobilization and Reconversion, were delegated to the Stabilization Administrator. PAUL DUNCAN,
Director of Information, Office of Economic Stabilization.

OFFICE OF INTER-AMERICAN AFFAIRS. This office was originally established in August 1940 as the "Office for the Co-ordination of Commercial and Cultural Relations Between the American Republics." The name was changed the next year to the "Office of the Co-ordinator of Inter-American Affairs." Nelson A. Rockefeller served as co-ordinator until his appointment as assistant secretary of state in December 1944. In March 1945 the office was renamed the "Office of Inter-American Affairs," with Wallace K. Harrison of New York City in charge as director. Shortly after the end of the war in the Pacific, the informational programs of the office were placed under the Interim International Information Service established in the Department of State by executive order.

The function of the Office of Inter-American Affairs for five years has been to assist and support the foreign policy of the United States with co-operative programs reaching the people of the other American republics. Such inter-American programs were designed to speed victory over the Axis powers and to help the people of the Western Hemisphere solve to mutual advantage the economic and social problems affecting their security.

At the Inter-American Conference on Problems of War and Peace held in Mexico City in

March 1945, the nations of the Western Hemisphere culminated their common wartime determination to protect their freedom by adopting far-reaching measures to continue participation in the United Nations war effort and to ease the transition from a war to peacetime economy.

The 1945 operations of the Office of Inter-American Affairs can be grouped, in general, into two broad categories—economic development, with attendant health, sanitation and food programs, and informational activities.

The comprehensive basic economy program has had three major objectives: safeguarding the health of the United States and Allied military forces stationed in the other republics; maintaining conditions of health and food supply for workers engaged in production of strategic materials; and laying the basis for continued elevation of health and nutrition standards in the American republics. Health and sanitation and food supply projects now in operation in the other Americas are entirely on a co-operative basis. Health projects include control of malaria and other tropical diseases, drinking water and sewage disposal projects and programs for training medical and nursing personnel.

The food supply program for 1945 concentrated on expansion of food production to solve wartime shortages, as well as improvement in storage facilities and agricultural techniques which will have long-range effects on the internal economies of the other Americas.

During 1945 the Office of Inter-American Affairs placed increased emphasis on its transportation program, particularly in regard to maintenance of strategically located railways in the other Americas. In this phase of activity, the office co-operates with the other republics by furnishing the services of technicians to advise them on maintenance and operational methods.

The educational program of the office was organized in 1943 to develop a comprehensive co-operative educational program with the other American republics. During the last year, the program has expanded through the signing of several new reciprocal agreements with various hemisphere republics, calling for joint contributions of funds, materials and educational personnel. Educational work in the United States has included a continuation of consultant services to teachers and schools, planning of inter-American institutes, lecture series and workshops and the distribution of teaching aids.

Other United States activities of the office are directed toward the increased participation of local and regional groups in inter-American programs. This participation is encouraged, in part, through assistance in program planning to 20 inter-American centers established in regional areas in the United States.

As a basis for promoting hemisphere measures that would most materially aid the war against the Axis, it early became the duty of the office to present facts and information as clearly and accurately as possible to all hemisphere relations. For this work, all means of communication—such as the press, radio and motion pictures—are used. Programs in these areas, carried out by the Office of Inter-American Affairs up until the time of its reorganization in August of 1945, are being continued by the Interim International Information Service of the Department of State.

Even prior to Pearl Harbor the office had established facilities to combat Axis propaganda in one of the enemy's favorite fields—short wave radio. On the day the United States entered the

war, this service was put on a 24-hour, 7-day week basis.

Under another phase of press activities, over 100 newspaper publishers, editors and journalists from other countries of the hemisphere have made extensive tours of the United States at the invitation of the National Press Club in co-operation with the Office of Inter-American Affairs.

Motion pictures have played an important part in the informational program of the office. There are two types of motion picture operations: theatrical and nontheatrical. In the first, the office has co-operated with the motion picture industry to extend the production of feature pictures, short subjects and newsreels designed to further the joint war effort and mutual understanding. In the second, the office has originated a hemisphere-wide program of nontheatrical film showings. Informative and educational short subjects dealing with the war effort and ways of life in the Americas are produced, or obtained from various sources for distribution through schools, clubs, churches and other nontheatrical channels.

WALLACE K. HARRISON,
Director, Office of Inter-American Affairs.

OFFICE OF PRICE ADMINISTRATION (OPA). During 1945 the Office of Price Administration continued to control prices and rents under authority of the Emergency Price Control Act of 1942 and the Stabilization Act of 1942 and to ration consumer goods under the authority of the Second War Powers Act as delegated by the president.

The abrupt conclusion of the war brought the agency even graver responsibilities. During the 72 months after the war began in September 1939, the cost of living in the United States had risen only 31 per cent above its August 1939 level, nine tenths of this rise having come before the president's "hold-the-line" order of May 1943. This record was in sharp contrast to a comparable 72-month period in the First World War when the cost of living rose 108 per cent. Yet almost half of the First World War inflation came after the 1918 armistice was signed.

Recognizing the danger of a similar occurrence, on Aug. 18, 1945, President Truman issued an executive order clearly setting forth the stabilization program for the transition from war to peace. The order stated that the cost of living and the general level of prices should be held at the then existing levels, and the pricing of reconversion products must be on a basis of full volume rather than on a volume that will be limited during the change-over from war goods to peacetime production.

In the months preceding V-J Day, OPA was faced with a severely diminished supply of meat available for rationing, and by a rise of clothing prices. Both these problems seriously threatened the entire stabilization program. With the end of the war, reconversion pricing and the problems of decontrol, which began late in 1944, moved to the center of OPA operations.

To solve the critical meat situation, the office early in the year, at the direction of the Office of Economic Stabilization (later merged in the Office of War Mobilization and Reconversion), placed an over-riding ceiling on live cattle to meet packer protests that processing margins, despite subsidy payments, were being reduced below cost by rising cattle prices. During June, in co-operation with other government agencies, the office launched a 10-point program designed to encourage increased feeding of beef cattle, to

raise margins for meat processors, and to improve the distribution of beef and pork.

In the apparel field, OPA's most outstanding action was issuance of the maximum average price orders covering garment manufacturers and rayon and woolen mills. The core of each order was the requirement that any producer covered must maintain an average price for his deliveries during each quarter at or below his average price for the same products in the base period, usually 1943. Individual prices above or below the average were permitted. In the case of most lower-priced garments, the order was later amended to provide certain temporary exemption levels for manufacturers dependent on the depleted supply of cheap fabrics. For low-priced cotton apparel, manufacturers of which had received priority assistance from the War Production Board, OPA established dollar-and-cents prices and required manufacturers to affix the price to each garment.

OPA's reconversion pricing program covered both industries as a whole and individual concerns resuming production of commodities which had been entirely or largely off the market because of wartime restrictions, as well as certain firms whose production was greatly curtailed in 1944. The industry-wide formula for establishing prices adjusted total costs for the product during the last period of normal production, usually the year 1941, for the following factors: (1) legal increases since October 1941 in the basic wage schedules of factory employees in that industry; and (2) the general legal increases since October 1941 in prices of materials and components entering into the industry's average factory costs for the product. To the 1941 costs so adjusted was to be added a profit margin equivalent to the industry's 1936-39 percentage profit margin before income taxes. The resulting figure thus obtained would yield an increase factor to be applied to the October 1941 price. Unless the price calculated by use of this factor was less than the existing authorized price, it would become the ceiling price. A broad adjustment policy of individual firms was also provided.

Soon after V-J Day, OPA further facilitated the reconversion process by permitting increases under its price adjustment procedure to manufacturers operating at a loss who did not fall within the reconversion pricing policy because their goods had not been out of production and who, because their products were not essential either to the military program or to the civilian economy, had not been able to qualify for increases under wartime standards.

Under post-V-J Day policy for price decontrol, formulated at the direction of the Office of Economic Stabilization, control was to be suspended when supply came into reasonable balance with demand, and the threat to price stabilization was removed. Suspension was to be succeeded by outright exemption as soon as experience confirmed the accuracy of an initial judgment in this respect. Another basis for releasing commodities from price control involved three tests: (1) they were not significant in living or business costs; (2) their control imposed an administrative burden on the office disproportionate to the benefits to be gained by continued control; (3) their decontrol would not lead to diversion of the productive facilities or to impaired price control for other commodities.

Decontrol policy with regard to rationing called for lifting of control from any commodity

as soon as civilian supply increased, due to cancellation of government set-aside orders or contracts or to improved production, to an extent which brought it into reasonable balance with demand. Thus rationing of gas stoves and used and new 1942 automobiles was dropped soon after V-E Day. Immediately after V-J Day it was dropped from gasoline, fuel oil, oil stoves and processed foods. Control was later dropped from solid fuels (in the Pacific Northwest), men's rubber boots and rubber work shoes, meats, salad and cooking oils, and dairy products, shoes and, finally, tires. Sugar rationing was the only rationing program carried into 1946. Controls over livestock slaughter and meat distribution were also lifted.

OPA decontrol policy with regard to residential rentals was to lift control area by area, as the threat of inflation disappeared through the decline or end of war activities in particular localities. During the early weeks following V-J Day this decline became significant in only relatively few defense-rental areas and the removal of areas from control was therefore very gradual. The continued decline in pressure was expected, however, to enable the office by the end of the fiscal year (June 30, 1946) to decontrol approximately one fifth of all defense-rental areas.

WILLIAM R. AUMAN,

Assistant Director, Editorial Division, OPA.

OFFICE OF SCIENTIFIC RESEARCH AND DEVELOPMENT. Established by Executive Order No. 8807 dated June 28, 1941, this office is charged with the initiation and support of scientific research on the mechanisms and devices of warfare, and on medical problems affecting the national defense. It consists of the National Defense Research Committee which had been created June 27, 1940, by an order of the Council of National Defense, and the Committee on Medical Research which was established by Executive Order No. 8807, and an Office of Field Service which was established Oct. 15, 1943.

The office is administered by a director, Dr. Vannevar Bush, assisted by an advisory council, consisting of the director, representatives of the army, the navy, and the National Advisory Committee for Aeronautics, and the heads of the two primary operating agencies of the office, the National Defense Research Committee and the Committee on Medical Research. The advisory council assists the director on matters of broad policy.

The National Defense Research Committee advises and assists the director in the performance of his scientific research duties with special reference to the mobilization of scientific personnel and resources of the nation. This committee is composed of: chairman, Dr. J. B. Conant (Harvard University); vice chairman, Dr. Richard C. Tolman (California Institute of Technology); Dr. Frank B. Jewett, president, National Academy of Sciences; Casper W. Ooms, commissioner of patents; army representative, Brig. Gen. E. A. Regnier, USA; navy representative, Rear Adm. A. H. VanKeuren, USN; Dr. Roger Adams (University of Illinois); Dr. Karl T. Compton (Massachusetts Institute of Technology); executive secretary, Irvin Stewart.

The Committee on Medical Research assists the director in the performance of his medical research duties. It is composed of: chairman, Dr. A. N. Richards (University of Pennsylvania); vice chairman, Dr. Lewis H. Weed (chairman, Division of Medical Sciences, National Research Council; Johns Hopkins Medical School); army

representative, Brig. Gen. James S. Simmons; navy representative, Rear Adm. Harold W. Smith; Federal Security Agency representative, Dr. R. E. Dyer; Dr. A. R. Dochez (Columbia University); Dr. A. Baird Hastings (Harvard University); executive secretary, Irvin Stewart.

To deal with the great variety of problems submitted to the National Defense Research Committee and the Committee on Medical Research by the army and navy, a number of panels of experts have been set up to formulate research programs, select competent contractors and to follow the progress of work undertaken and to maintain liaison with the particular branches of the army and navy which are concerned with each project.

The Office of Field Service is headed by Dr. Alan T. Waterman. The increasing demands for personnel with special experience in the development of new weapons for service with the army and the navy, principally outside of the United States, prompted its creation. The Office of Field Service is charged with the responsibility of furnishing scientific and technical assistance to theater and higher echelon commanders of the army and the navy, particularly with a view to insuring the most effective use of weapons developed by the National Defense Research Committee.

The director is empowered to contract with and transfer funds to existing governmental agencies and institutions and to enter into contracts and agreements with individuals, educational and scientific institutions, industrial organizations, and other agencies for studies, experimental investigation, and reports. The general policy of the office is to use existing facilities rather than to create new ones. To this end, numerous contracts have been entered into with institutions of these several classes. These contracts are intended to cover actual out-of-pocket expenses, together with a reasonable allowance of overhead, in order that contractors shall neither gain nor lose by participating in the war research program. Most of the projects for research and development are undertaken by the OSRD at the direct request of the armed services and are of a very confidential nature, so that reports of progress and of results obtained are necessarily held to a closely limited distribution and cannot be made generally available. However, large procurement orders placed by the army and navy for various devices and equipment developed under OSRD contracts are indicative of the important results obtained.

The Office of Scientific Research and Development was charged with the initiation and support of scientific research on weapons and equipment for the army and navy. Some of the fields in which this equipment has been developed in cooperation with the army and navy are rockets, radar, atomic energy, flame throwers, amphibious vehicles, fire control mechanisms, smoke generators, optical equipment, etc. OSRD was not equipped, however, to handle the great task of evaluating the large number of inventions and proposals submitted by the general public. This function was performed by the National Inventor's Council of the Department of Commerce.

CARROLL L. WILSON,

Executive Assistant to the Director, Office of Scientific Research and Development.

OFFICE OF WAR INFORMATION (OWI). Prior to Aug. 31, 1945, when it was abolished, the OWI carried on an extensive program of psychological warfare against the enemies of the United

States in Europe and in the Pacific. OWI personnel worked with the army and the navy in preparing and disseminating leaflets, in operating mobile loud speaker units, and in conducting propaganda broadcasts by both short and long wave. In liberated, neutral, and Allied countries, the OWI undertook to inform the people concerning the American war effort and the aims for which we fought, and broadly to make them acquainted with the nature of the American people and American culture. All available media—radio, broadcasts, motion pictures, publications, lectures and exhibits, library service—were employed. When the agency was abolished its foreign information services were transferred to a temporary International Information Service under the State Department.

Domestically the OWI continued its program of co-ordinating information about the war activities of the government, and organized information programs on such matters as the need for Victory Gardens, War Bond sales, tin and fat salvage, Merchant Marine and nurse recruiting. The Domestic Branch prepared a plan for an informational campaign in consultation with the other government agencies concerned and then allocated facilities contributed by private industry to the program in question. The branch acted as a clearing house for contributed time on the radio, for moving picture short subjects prepared at OWI instance by the motion picture industry, for magazine articles and news stories, and for advertising space contributed by manufacturers.

Elmer Davis continued as director of OWI until the agency was abolished. Edward Klauber was associate director; Edward Barrett, director of the Overseas Branch; and Neil Dalton, director of the Domestic Branch.

JULIAN L. WOODWARD,

Assistant to the Director, Office of War Information.

OFFICE OF WAR MOBILIZATION AND RECONVERSION. See WAR MOBILIZATION AND RECONVERSION, OFFICE OF.

OHIO. East North Central state, United States; admitted to the Union Feb. 19, 1803. Population (1940): rural, 2,293,263; urban, 4,614,349; total, 6,907,612. Land area, 41,122 square miles, divided into 88 counties. Chief cities, with 1940 populations: Cleveland, 878,336; Cincinnati, 455,610; Columbus, the capital, 306,087; Toledo, 282,349; Akron, 244,791; Dayton, 210,718; Youngstown, 167,720; Canton, 108,401; Springfield, 70,662.

Chief State Officers, 1945.—Governor, Frank J. Lausche; lieutenant governor, George D. Nye; secretary of state, Edward J. Hummel; treasurer, Don H. Ebright; auditor, Joseph T. Ferguson; attorney general, Hugh S. Jenkins.

Judiciary.—Chief justice of the state supreme court, Carl B. Weygant; associate justices, Edward C. Turner, Roy H. Williams, Charles S. Bell, Charles B. Zimmerman, William L. Hart, Edward S. Matthias.

Legislature.—General Assembly (Senate, 33 members; House of Representatives, 136) convenes biennially in odd years on the first Monday in January.

Education.—Public elementary schools (as of June 30, 1944), 3,750; teachers, 20,420; pupils, 714,267; average yearly salary of elementary school teachers, \$1,690. Public junior high schools (June 30, 1944), 122; teachers, 2,746; students, 80,074; public senior high schools (June 30, 1944), 1,109; teachers, 14,617; stu-

dents, 339,777; average yearly salary of junior and senior high school teachers, \$2,008. There are 45 institutions in the state that offer teacher training courses. Schools receiving financial aid from the state: Bowling Green State University, Kent State University, Miami University, Ohio State University, and Ohio University. Total state appropriation for education (1945), \$45,000,000; appropriation by cities and counties, \$87,094,641. Superintendent of public instruction, Kenneth C. Ray.

Finances.—Following is a report of Ohio's finances for the year 1944, supplied by the state treasurer's office:

Balance in treasury, Jan. 1, 1944.....	\$131,782,225.02
Receipts, 1944	394,375,515.30
Total	\$526,157,740.32
Disbursements, 1944	376,087,758.63
Balance, Dec. 21, 1944.....	\$150,069,981.69

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.).....	152,119	142,956	176,988
Oats (1,000 bu.).....	40,285	37,224	52,890
Buckwheat (1,000 bu.).....	283	294	304
Wheat (1,000 bu.).....	40,889	46,805	62,508
Barley (1,000 bu.).....	732	475	660
Rye (1,000 bu.).....	1,132	608	604
Sugar beets (1,000 short tons)	325	113	220
Hay:			
Alfalfa (1,000 tons).....	889	746	927
Clover and timothy (1,000 tons).....	2,003	2,261	2,299
Tame (1,000 tons).....	3,323	3,270	3,530
Soybeans for beans (1,000 bu.).....	9,889	22,457	22,591
Tobacco (1,000 lb.).....	25,433	25,347	22,740
Potatoes (1,000 bu.).....	11,318	5,810	7,560
Apples (1,000 bu.).....	4,914	5,395	1,230
Peaches (1,000 bu.).....	732	1,095	750
Pears (1,000 bu.).....	500	373	246
Grapes (tons)	22,760	24,400	5,000

OILS AND FATS. See CHEMISTRY.

O'KELLY, Sean Thomas, president of Eire: b. Dublin, Ireland, Aug. 25, 1883. Sean O'Kelly was elected second president of the Irish state on June 18, 1945, to succeed Dr. Douglas Hyde, and was inaugurated June 25 at St. Patrick's Hall, Dublin Castle. With Arthur Griffith, O'Kelly was one of the founders of Sinn Fein, and from 1908-10, was its honorary secretary. When the Irish insurrection began in 1916, he was a captain on the staff of Patrick Pearse, Irish poet and commander in chief of the rebellion forces. From 1919-22, he was Irish envoy to Paris and Rome, and envoy to the United States, 1924-26. He was vice president of the Executive Council and minister for local government and public health, Irish Free State, 1932-39, and after 1939, minister of finance and minister of education. President O'Kelly is one of Eire's foremost Gaelic scholars, and has been a frequent contributor to the Irish and American press on Irish politics.

OKINAWA. See MARINE CORPS, U.S.; RYUKYU ARCHIPELAGO; WORLD WAR, SECOND.

OKLAHOMA. West South Central state, United States; admitted to the Union Nov. 16, 1907. Population (1940): rural 1,456,771; urban, 879,663; total, 2,336,434. Land area, 69,283 square miles, divided into 77 counties. Principal cities, with 1940 populations: Oklahoma City, the capital, 204,424; Tulsa, 142,157; Muskogee, 32,332; Enid, 28,081; Shawnee, 22,053; Lawton, 18,055.

Chief State Officers, 1945.—Governor, Robert S. Kerr; lieutenant governor, James E. Berry; secretary of state, Frank C. Carter; treasurer, A. S. J. Shaw; attorney general, Randall S. Cobb.

Judiciary.—Chief justice of the Oklahoma Supreme Court, Thomas L. Gibson; associate justices, Wayne L. Bayless, Earl Welch, Ben Arnold, N. S. Corn, Monroe Osborn, Thurman S. Hurst, Denver Davison, Fletcher S. Riley.

Presiding judge of the Criminal Court of Appeals, Dick Jones; associate judges, Bert B. Barefoot and Thomas H. Doyle.

Legislature.—Oklahoma's legislature (Senate, 44 members; House of Representatives, 120) convenes biennially in odd years on the second day of January.

Education.—Public elementary schools (latest report, 1943-44 school year), 3,610; teachers, 11,035; pupils, 386,061; average yearly salary of elementary school teachers, \$1,274. Public junior high schools, 95; teachers, 1,032; students, 39,272. Public senior high schools, 853; teachers, 5,106; students, 134,532; average yearly salary of junior and senior high school teachers, \$1,459. Education in Oklahoma is compulsory for all children between the ages of 7 and 17, inclusive. There are 5 teacher training schools. Total state appropriation for education (1944), \$14,792,940; appropriation by cities and counties (1944), \$18,743,182.

Finances.—The following statement of Oklahoma's finances for the fiscal year 1944-45 were supplied by A. S. J. Shaw, state treasurer:

Balance in treasury, beginning of fiscal year 1944-45	\$ 30,182,907.23
Receipts, 1944-45	97,454,175.25
Total	\$127,637,082.48
Disbursements, 1944-45	89,443,330.95
Balance, beginning of fiscal year 1945- 46	\$ 38,193,751.53

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.).....	26,821	32,958	27,835
Oats (1,000 bu.).....	27,048	27,569	22,059
Wheat (1,000 bu.).....	48,435	85,914	73,332
Barley (1,000 bu.).....	4,970	3,990	2,352
Rye (1,000 bu.).....	685	1,520	1,159
Sorghums for grain (1,000 bu.).....	7,316	12,915	8,360
Flaxseed (1,000 bu.).....	107	216	88
Cotton (1,000 bales)...	565	634	390
Hay:			
Alfalfa (1,000 tons).....	465	675	759
Tame (1,000 tons).....	936	1,331	1,317
Wild (1,000 tons).....	402	658	664
Pecans (1,000 lbs.).....	16,960	14,000	22,500
Peanuts (1,000 lbs.).....	42,090	111,180	147,900
Sweet potatoes (1,000 bu.).....	792	1,040	850
Potatoes (1,000 bu.).....	2,252	2,015	1,150
Peaches (1,000 bu.).....	477	286	734
Pears (1,000 bu.).....	143	96	203
Grapes (tons)	2,750	3,200	2,500

OLMSTEAD, Albert Ten Eyck, American orientalist: b. Troy, N.Y., March 23, 1880; d. Chicago, Ill., April 11, 1945. Professor of oriental history at the University of Chicago after 1929, Dr. Olmstead was one of the leading orientalists in the United States. His contributions to New Testament history have been of special importance. Dr. Olmstead received his B.A. degree from Cornell University in 1902, an M.A. the next year, and a Ph.D. in 1906. He studied in Jerusalem and Athens from 1904 to 1907, and from 1907 to 1908 led the Cornell expedition to

Asia Minor and the Assyro-Babylonian Orient. He taught at the Princeton Preparatory School, 1908-09, and then spent eight years at the University of Missouri, the last three as associate professor of ancient history. He was professor of history and curator of the Oriental Museum at the University of Illinois from 1917 to 1929, when he became Oriental Institute professor of oriental history at Chicago. During the year 1936-37, he was annual professor at the American School of Oriental Research in Baghdad, Iraq. Dr. Olmstead's special field was the period from Darius to Constantine, the latter portion including Palestinian and Syrian history, with the period of the life of Christ and the century after presenting special problems for the secular historian. He upset theological scholars in 1941 by claiming greater historical accuracy for St. John's Gospel than those of Matthew, Mark, and Luke. Among Dr. Olmstead's works are *Western Asia in the Days of the Sargon of Assyria* (1908); *History of Assyria* (1923); *History of Palestine and Syria* (1931); and *Jesus in the Light of History* (1942).

OMAN. See ARABIA.

ONISHI, Takijiro, Japanese naval officer: committed suicide in Tokyo, Aug. 17, 1945. Vice Admiral Takijiro Onishi had served as commander in chief of the Japanese naval air forces in the Philippines from November 1944 to May 1945, when he was made vice chief of the Navy General Staff during a general shake-up in the Navy high command. On May 31, 1945, Tokyo radio announced in a domestic broadcast that Admiral Onishi had been chosen for this position "because he was the originator as well as one of the persons who perfected the air special attack tactics," or Kamikaze suicide air attacks. In his suicide note addressed "to the spirits of members of the special-attack corps," Admiral Onishi declared that his death was an attempt "to make atonement to the souls of my former subjects and to members of their bereaved families." He urged "young men at large" to "attend properly to your peacetime circumstances, and maintaining steadfastly the spirit of the special-attack corps, do your utmost for the revival of the Japanese race and for world peace."

ONTARIO. One of the nine provinces of Canada, and next to Quebec, the largest; area, 412,582 square miles, of which 49,300 square miles are water. The population in 1941 was 3,787,655. The greatest extent of the province from east to west is 1,000 miles, and from north to south, 1,075 miles. Principal cities, with their populations in 1943, are: Toronto, 1,100,000; Ottawa, the Dominion capital, 215,000; Hamilton, 176,000; Windsor, 121,000; London, 86,000.

Government.—The government of the Province of Ontario is administered by a lieutenant governor, a Cabinet and a one-chamber legislature of 90 members. At the provincial election in June 1945, the following parties were returned to the legislature: Progressive Conservatives, 67; Liberals, 10; Co-operative Commonwealth Federation Party, 7; Labor Progressive, 2; Liberal-Labor, 3; Independent, 1.

Education.—There is a complete state system of elementary and secondary schools. In 1942 there were 7,426 day and evening schools of all grades in operation with 630,891 pupils enrolled. Certified teachers in these schools numbered 21,472. Total expenditure by the province on education in 1941-42 was \$13,177,000. There are

five universities—University of Toronto (founded 1827); Queen's University, Kingston; University of Western Ontario, London; McMaster University, Hamilton; Ottawa University, Ottawa. The University of Toronto has more than 1,000 professors and lecturers, and 7,129 students. The Royal Military College at Kingston is maintained by the Dominion government.

Finances.—In 1944, revenues and expenditures of the government were estimated to balance at \$123,519,682. The public debt on March 1, 1943, was \$704,864,361.

Agriculture, Mining and Manufacturing.—Ontario is rich in both agricultural and mineral resources. About 14,000,000 acres are under cultivation. The leading crops are wheat, rye, oats, barley, mixed grains, potatoes, hay and clover. In 1944 agricultural products were valued at \$585,000,000. Livestock in 1942 included 527,000 horses; 1,149,900 milk cows; 1,489,300 other cattle; 688,900 sheep; 1,861,300 swine; and 24,621,800 head of poultry. Fruit growing is also important in Ontario, especially in the Niagara Peninsula. In 1942 the fruit crop was valued at \$7,821,000. Minerals produced in 1942 included 2,763,824 ounces of gold and 4,452,787 ounces of silver. In 1944 the entire mineral output was valued at \$210,000,000. The same year manufacturing establishments of Ontario produced goods valued at more than \$4,000,000,000—slightly more than 50 per cent of all Canada's production. Ontario's exports in 1944 exceeded \$1,500,000,000. The province's water power provides electric energy at the lowest cost in the world for comparative service in similar territory.

Highways.—In 1942 there were in Ontario 73,089 miles of public roads on which \$18,122,435 were spent in that year. A considerable portion of the roads is hard-surfaced. Queen Elizabeth Way, extending from opposite Buffalo, N.Y., to Toronto, is one of the finest highways on the North American continent.

K. G. ARMSTRONG,
Director, Bureau of Public Information, Province of Ontario.

OPHTHALMOLOGY (Gr. *ophthalmos*, eye; *logos*, discourse or science of). Recent progress in ophthalmology has been gratifying. Chemical studies have been made of the composition of the crystalline lens. Glutathione is the tripeptide consisting of the amino acids—glycine, cysteine, and glutamic acid. The loss of glutathione is one of the factors in the production of cataract.

Diagnosis has been materially aided by improvement of many optical instruments including certain types of ophthalmoscopes and the corneal microscope and slit lamp. The use of red-free light by the utilization of filtering lenses enables the observer to note minute changes in the fundus more readily. Progress has been made in photographing the lesions of the eye, both those of surface character as well as those of the fundus. Angioscotometry, a phase of perimetry which charts changes due to the circulatory mechanism of the retina, has been developed.

Improvements have been devised in the tests for red-green color deficiency but no cures have been evolved. The defect is congenital. Knowledge of color blindness is still based on a number of old theories.

The ability of sailors and fliers to adapt to the dark has been measured by test lights exposed in flashes of one fifth of a second duration. Gradual training has been of some aid. Exposure to the blinding flashes of powerful

searchlights has diminished dark adaptability. Looking through filters of red glass or blue glass has not helped as much as formerly believed. Visual disturbances occur in pilots in the course of flying at high altitudes and also in power dives. Visual acuity is diminished following exposure to the beam of a searchlight. Drugs used to improve visual defects for night flying and high altitudes consist of ascorbic acid or of a synthetic preparation of 8-methyl caffeine. Introducing measured doses of light into the eye is another method of increasing visual acuity. Dark filters are worn for several days previous to night flying. Anoxia has a marked effect upon the function of the rod and cone layer, the optic nerve, and the cerebral cortex. Decrease in the ability to change the intensity of light and color is also accompanied by defective depth perception. Dark adaptation studies have been given impetus by war conditions. Visual ability, as far as darkness is concerned, may be divided into light adaptation (photopic vision) and dark adaptation (scotopic vision). Defective night vision may be a sign of vitamin A deficiency.

For better efficiency in flying operations at night, the flyer should maintain a well-balanced diet, and allow himself sufficient time to become dark-adapted before take-off (30 to 35 minutes in moderate moonlight or darker). Peripheral visual fields should be used by looking away from an object 10–15° instead of directly at it. Advantage should also be taken of contrast whenever possible to assist in locating enemy aircraft.

Visual standards have changed with the advent of the machine age. The man who pilots a plane must have normal vision (20/20) with both eyes, preferably without glasses. The man who drives a tank or truck should have at least 20/100 vision without glasses, correctible to 20/40 vision in each eye with glasses. Some individuals may be permitted to have less vision without glasses or less vision with correction if they are experienced in their work. Additional methods have been devised for the detection of malingerers.

Progress has been made in the knowledge of the character of the underlying principles producing squint (cross-eyes or strabismus). Eye exercises have proved beneficial in selected cases where the repetition of the act required of the eye has improved its efficiency. Orthoptic training, which is the name applied to these muscle exercises, has proved of great benefit before and after operation in those instances where surgery is required.

Contact lenses are now fitted on the basis of an impression made of the surface of the eyeball. Mold materials are used. Those most commonly used are negocoll, dental wax, Kerr's hydrocolloid, zelex, and Coe-loid powder.

Gonioscopy is the study of the angle formed in the anterior chamber, by the iris and cornea. A special contact lens is placed over the eye for the purpose of magnifying the chamber angle which is then viewed with the aid of the binocular loupe or a combination of the telescope and electric illuminating system, known as the gonioscope. Operations in the anterior chamber may be performed with the aid of the contact lens and gonioscope.

Aniseikonia (Gr. *a*, without or negative; *iso*, equal; *eikon*, image) is a condition in which the image as seen with one eye is larger than that seen with the other. Image size is equalized by the use of spectacles that consist of either a system of lenses with the magnifying effect of a

telescope or the minifying effect of an inverted telescope, placed in front of one eye, or by a combination of both. In the latter instance, the eye seeing the smaller image is corrected by lenses having one half of the necessary magnifying effect, and the other, one half of the minifying effect.

In injuries of the eye, better methods have been evolved for using the X-ray in the removal of foreign bodies from the eyeball. The biplane fluoroscope, which enables the operator to look down on the eye and through the side of the eye, has been of great help in localizing foreign bodies in the course of an operation. The electromagnet is very effective for the removal of magnetic foreign bodies. Endoscopic instruments have been devised for the more effective removal of nonmagnetic foreign bodies. The foreign body is viewed by placing the endoscope in the eyeball through a small opening, and can thus be extracted with fine, small forceps.

The use of skin grafts for the correction of lid defects due to injury or disease has been vastly improved. The present-day techniques for corneal transplantation have given better results. In some cities an eye bank has been started. This consists of the eyes taken from stillborn infants and from individuals who have just died. These are preserved under conditions of refrigeration and in preserving solutions for use as needed.

Contributions have been made to the improvement of methods in traumatic surgery, and in the treatment of postoperative complications. Cataract surgery has been improved by many methods. A keratome, instead of a cataract knife for opening into the eyeball, is being used by some. Corneoscleral sutures are used after the lens is removed. This lessens the danger of a prolapse of the iris which is one of the complications of cataract surgery. The operations, designed to relieve patients suffering from infection of the tear sac, are more successful now because of the addition of new techniques.

X-ray and diathermy are being used with better results in the treatment of vascular tumors in and about the eye, particularly in angiomas of the retinae.

In the diagnosis of glaucoma, a disease due to increased pressure within the eye, improved methods have made earlier diagnosis possible, and treatment more satisfactory. The fields of vision may now be studied in such a way as to map out minute changes in peripheral vision. Prostigmin (5 per cent) furmethide (10 per cent), mecholyl (20 per cent), and carbamylcholine chloride (0.75 per cent), (doryl) have been added to the drugs used in the treatment of glaucoma. Eserine salicylate (one fourth of 1 per cent) and pilocarpine nitrate (2 per cent) are still, however, in common use.

Epidemic keratoconjunctivitis, formerly rare, has been seen more commonly in the Western Hemisphere. This condition has been known in Malaya for a long time. The characteristic signs of this disease are sustained swelling of the lids, sensation of foreign body in the eye, inflammation of the inner surface of the lids with the formation of small white bodies (follicles), enlargement of the lymph glands of the neck, and the formation of small white opacities in the cornea. Blood plasma, taken from convalescing patients, has a marked effect on lessening the activity of the causative agent, a filtrable virus. This possibly causes the opaque areas to become smaller.

Keratomalacia is a disease of the cornea, due to vitamin A deficiency. Shark liver oil, which is very rich in vitamin A, is used in the treatment.

Punctate keratitis, an inflammatory disease of the cornea, characterized by small, superficial, opaque spots, is treated by the use of vitamin B complex or riboflavin. A study of the bacterial flora of the conjunctiva has indicated that the causative organisms producing a moderate inflammation of this lining, varies in different parts of the world. Generally speaking, the more common of these organisms are the staphylococcus, streptococcus, pneumococcus, and hemophilus duplex (Morax-Axenfeld bacillus). Choline has been used in the treatment of ulcers of the cornea.

The new mydriatic and cycloplegic drug is dibutoline sulphate. Buffered solutions, wetting agents, and iontophoresis have been utilized to aid the cornea in absorbing drugs. The pH of a buffered solution is the determining factor as to its usefulness in the eye, since there is so much variance in the acidity or alkalinity of the lacrimal (tear) fluid. Wetting agents, particularly aerosol, have been used with increasing frequency to aid the ability of the sulfonamide drugs to enter the eye. In some cases of acute glaucoma in which miotics have failed to reduce tension, intravenous injections of hypertonic solutions, among them sorbitol, have been used.

Chemotherapy has made great strides in the cure of ocular diseases. The sulfon drugs or sulfonamide series of drugs, consist primarily of sulfanilamide, sulfadiazine, sulfathiazole and sulfapyradine. Others, less frequently used, are sulfasuccinamide and sulfaguadinine. The sulfa derivative drugs used in ophthalmology are either used locally in ointment or drop form, or given by mouth. Sulfadiazine is the type most commonly given by mouth, because it is less toxic. Sulfathiazole is the most effective one for local application. These drugs are useful in inflammations of the conjunctiva and cornea. They are also effective in inflammations of the iris and ciliary body of the eye (uveitis), inflammation of the orbit (orbital cellulitis), optic neuritis, trachoma and gonorrheal conjunctivitis. If the infection is caused by the pneumococcus, sulfadiazine or sulfapyradine is advocated. If due to the staphylococcus, sulfathiazole is recommended. In infections due to the gonococcus, sulfathiazole or sulfapyradine acts as a powerful antibiotic. The sulfonamide drugs are also being used in trachoma.

Another chemotherapeutic agent is penicillin. It accomplishes its antibacterial effect by lessening the activity of certain microorganisms. It is very effective in severe infections of the eye, particularly those affecting the surface layers. It is used in drug or ointment form containing 1,000 Oxford units per cubic centimeter. It is also used as an intramuscular or an intravenous injection, and as such is given dissolved in physiological salt solution (0.9 per cent salt in water). From 20,000 to 160,000 units per day are given in divided doses by one of these methods. Some of the more common microorganisms producing diseases of the eye that succumb to penicillin are staphylococcus, streptococcus, gonococcus, meningococcus, pneumococcus, and treponema pallidum (causative agent of syphilis). The germs producing gas gangrene (clostridium welchii) and tetanus (clostridium tetani) are also destroyed by penicillin. Both sulfathiazole and penicillin have been injected into the anterior

chamber for the treatment of iridocyclitis and uveitis.

Bibliography.—Among recent outstanding references on ophthalmology, the following have been selected: Bellows, John G., "The Evaluation of Penicillin in Ocular Therapeutics," *Journal of the Indiana Medical Association*, January 1945; Braley, Alson E., "Epidemic Keratoconjunctivitis," *Archives of Ophthalmology*, January 1945; Clark, Ivor, "Vision Problems of Military Students with Heavy Academic Loads," *Journal-Lancet*, January 1945; Cushman, Beulah, "Analysis of Cases of Aniseikonia," *Archives of Ophthalmology*, January 1945; Dimitry, T. J., and Azar, Paul, "The Use of Choline in Cases of Ulcer and of Leukoma of the Cornea," *American Journal of Ophthalmology*, January 1945; Eggers, Harry, "Estimation of Uncorrected Visual Acuity in Malingerers," *Archives of Ophthalmology*, January 1945; Frank, Herman W., "Management of the Complications of Introcular Surgery," *Journal of the Medical Association of Alabama*, February 1945; Hartmann, Edward, "Optochiasmic Arachnoiditis," *Archives of Ophthalmology*, January 1945; Hughes, W. ROLAND I. PRITKIN,
Loyola University School of Medicine Faculty,
Chicago, Ill.; formerly Lieut. Col., Medical
Corps, Army of the United States.

ORANGE FREE STATE. See SOUTH AFRICA, UNION OF.

ORANGES. See CITRUS FRUITS.

OREGON. Pacific state, United States; admitted to the Union Feb. 14, 1859. Population (1940): rural, 558,009; urban, 531,675; total, 1,089,684. Land area, 96,350 square miles, divided into 36 counties. Principal cities, with 1940 populations: Portland, 305,394; Salem, the capital, 30,908; Eugene, 20,838; Klamath Falls, 16,497; Medford, 11,281; Astoria, 10,389; Bend, 10,021.

Chief State Officers, 1945.—Governor, Earl Snell; secretary of state, Robert S. Farrell, Jr.; treasurer, Leslie M. Scott; attorney general, George Neuner.

Judiciary.—Chief justice of the Oregon Supreme Court, J. O. Bailey; associate justices, Harry H. Belt, James T. Brand, Arthur D. Hay, Percy R. Kelly, Hall S. Lusk, George E. Rossman.

Legislature.—The state legislature (Senate, 30 members; House of Representatives, 60) meets biennially in odd years.

Education.—Public elementary schools (latest report, 1943-44 school year), 1,376; teachers, 5,090; pupils, 163,232; average yearly salary of elementary school teachers (1944-45), \$1,781. Public junior high schools (1943-44), 32; teachers, 343; students, 11,662; average yearly salary of junior high school teachers (1944-45), \$1,939. Public senior high schools (1943-44), 241; teachers, 2,404; students, 51,126; average yearly salary

of senior high school teachers (1944-45), \$2,157. There are 3 colleges of education and 2 normal schools in the state. The three colleges of education as well as Oregon State College, and the University of Oregon, receive financial aid from the state. Total state appropriation for elementary and secondary education in 1944, \$7,300,000 (approx.); appropriation by cities and counties, \$18,000,000 (approx.). Education in Oregon is compulsory for children between the ages of 7 and 16, inclusive.

Finances.—Following is a statement¹ of Oregon's finances for the fiscal year 1943-44, supplied by the state treasurer's office:

Balance in treasury, beginning of fiscal year 1943-44	\$ 73,080,619.84
Receipts, 1943-44	137,086,085.80
Total	\$210,166,705.64
Disbursements, 1943-44	119,585,842.88
Balance, beginning of fiscal year 1944-45	\$ 90,580,862.76

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	PRODUCTION		
	Average 1934-43	Final 1944	Preliminary 1945
Corn (1,000 bu.)	1,907	1,587	1,526
Oats (1,000 bu.)	8,998	10,828	8,959
Wheat (1,000 bu.)	18,724	23,105	21,603
Barley (1,000 bu.)	5,497	7,142	6,785
Rye (1,000 bu.)	488	450	468
Peas, dry field (1,000 bags)	175	575	388
Hay:			
Alfalfa (1,000 tons)	710	657	710
Clover and timothy (1,000 tons)	185	198	198
Tame (1,000 tons)	1,598	1,627	1,732
Wild (1,000 tons)	238	235	278
Potatoes (1,000 bu.)	7,289	10,340	11,610
Apples (1,000 bu.)	3,165	3,432	2,698
Peaches (1,000 bu.)	416	606	502
Pears (1,000 bu.)	3,720	4,354	4,842
Grapes (tons)	2,100	2,300	2,400
Cherries (tons)	18,990	20,700	22,900

ORKNEY ISLANDS. An archipelago off the northern Scottish coast constituting a single county of Scotland. The Orkneys, separated from Caithness by the six-mile-wide Pentland Firth, comprise 90 islands and islets with an aggregate area of 375.5 miles. The principal islands are Pomona (or Mainland), Hoy, South and North Ronaldshay, Westray, Sanday, Eday, Stronsay, and Rousay. A third of the islands are inhabited, the population in 1940 being estimated to number 21,700. Kirkwall (pop. 3,673), on Pomona, is the county town. Oats, turnips, and hay are the chief crops of the Orkneys, and about 16,000 acres are in pasturage. The surrounding waters yield large quantities of herring, cod, and lobsters.

Scapa Flow, lying between Pomona and Hoy, sheltered the British Grand Fleet during the First World War; in October 1939 the defenses of the anchorage were penetrated by a German submarine, which sank the battleship *Royal Oak*. Construction was then commenced of a causeway to protect the naval base on its eastern approaches. Formally opened on May 12, 1945, the mile-and-a-half seawall, which cost £2,000,000, joins South Ronaldshay and some islets to Pomona, the Pentland Firth then becoming the only free water to the east until the northern tip of Pomona, 30 miles beyond.

ÖSEL (SAAREMAA), an Estonian island in the Gulf of Riga, second largest in the Baltic; area,

1,010 square miles; pop. 66,000. The principal town is Arensburg (Kuresaare), pop. 4,339, on the southeast coast. Wheat, hemp and flax are exported; fishing is also an important industry. In September 1939 Estonia permitted the landing of Russian troops on Ösel, and, together with the republic, it was incorporated into the USSR the following year. German forces seized the island in September 1941. On Oct. 6, 1944, the Russians once more landed on Ösel, and they completed its recapture on Nov. 24, 1944.

OSTEOPATHY. Termination of hostilities found the osteopathic profession in circumstances different from those of any other school of medicine. During the war those in charge of the medical departments of the army, navy and other armed forces (excepting the United States Public Health Service) had refused to permit osteopathic physicians and surgeons to take examinations for commissions as medical officers. This was in the face of repeated acts of Congress providing for the payment of such men, and expressions by the Office of Production Management and Selective Service System as to their qualifications. Therefore these services had to be utilized in other fields of health work and in other activities of the armed services.

Months before hostilities began the Office of Production Management had said to Selective Service System: "The directives of the Selective Service Act provide for the 'maintenance of national health, welfare, and interest' in civilian as well as military life. . . All approved osteopathic colleges currently give general training in surgery and obstetrics, and in the majority of states graduates are licensed to practice in these two fields. . . It seems that the national interest would be best served by permitting [osteopathic] students to complete their training . . . and by permitting [osteopathic physicians] to serve in their civilian capacity rather than in the armed forces, where their professional skills would not be employed."

Selective Service therefore as early as July 16, 1941, directed that both osteopathic physicians and osteopathic students were necessary men in specialized professional fields and subject to deferment. This continued throughout the war. And from December 1942 until nearly the end of the war, pre-professional students preparing to study osteopathy also were subject to deferment.

This is in contrast with the First World War. In considering the draft law in 1917 the Senate inserted a provision to exempt medical students. The House rejected it. However the War Department met the situation by immediately furloughing back to their respective colleges inducted students preparing for the degree, Doctor of Medicine. This fact was brought out in the House of Representatives in 1918 when Congress approved an amendment to exempt medical students. Not only were osteopathic students not deferred during that war, but no steps were approved for expediting their release to resume their studies when the war had ended.

In the Second World War in order that the best possible service might be rendered to the public, the osteopathic state associations operated in conjunction with state Selective Service officials to be sure that osteopathic physicians and surgeons at least within the draft age located only in places where their services were essential. At the end of 1945 Congress established a department of medicine and surgery in the Veterans' Administration, and provided for

¹ Most recent made available.

the appointment therein of osteopathic physicians.

OUBANGUI CHARI. See FRENCH EQUATORIAL AFRICA.

OUANSKY, Constantine A., Soviet ambassador to Mexico: b. Nikolaev, Ukraine, Russia May 14, 1902; d. in a plane crash, Mexico City, Jan. 25, 1945. Responsible for some of the Soviet Union's most delicate and important foreign-relation negotiations, Mr. Oumansky was credited with greatly improving Russia's position throughout the Western Hemisphere, particularly in Latin America.

Only 15 when the Russian revolution ended the Czarist regime, Oumansky soon went to Moscow where he was graduated from the university in 1921. While a student at the university he joined the staff of Tass, the official world news agency of the Soviet Union, at various times covering Rome, Paris, and Geneva. He was a member of Maxim Litvinov's party, when as commissar of foreign affairs, Litvinov went to Washington to negotiate for United States recognition of Russia in 1933. He returned to Washington in 1936 to serve first as counselor to the Russian embassy, and after 1938, as its chargé d'affaires. He was made ambassador to the United States in 1939, the youngest diplomat known to have held a post of that importance in Washington. When the United States planned to give aid to Russia, he accompanied the first supply mission of Americans back to his country in September 1941, and helped to show them Russia's needs. In November of that year, Litvinov was appointed to succeed him, and he was then made director general of Tass, and was named to the Collegium of the Foreign Commissariat Governing Board. It was a logical step for him to be sent to Mexico with ambassadorial rank when the Foreign Commissariat decided to move for better rela-

tions with Latin-American countries. He arrived in Mexico City in June 1943, and quickly established diplomatic relations of first rate importance. At the time of his death, Colombia, Costa Rica, Nicaragua, Mexico, Cuba and Uruguay had renewed diplomatic relations with, and had recognized Soviet Russia, mostly through his efforts, despite much suspicion and anti-Communist reaction from conservative and Catholic elements in Latin America. Mrs. Oumansky, three members of the Soviet embassy and four crew members of the plane were killed in the same accident that ended the life of the ambassador.

OUTER MONGOLIA. See MONGOLIAN REPUBLIC.

OXFORD AND ASQUITH, COUNTESS OF (MARGOT ASQUITH): b. near the Scottish border, 1864?; d. London, July 28, 1945. Widow of Herbert Henry Asquith, famous Liberal prime minister of Great Britain from 1908 to 1916, Lady Oxford for 50 years moved in the inner circle of Britain's politics and government and was famous for her caustic tongue and her books of candid commentaries on the notables of the Victorian, Edwardian, and Georgian eras.

The daughter of Sir Charles Tennant, Alice Emma Margaret Asquith spent her early years at her father's country place near Edinburgh, and then moved to London. She married Herbert Asquith in 1894; three prime ministers, Gladstone, Rosebery, and Balfour signed her marriage register. Eleven prime ministers of England were numbered among her acquaintances, as well as many famous writers, including George Meredith, John Addington Symonds, Alfred Austin, and George Bernard Shaw. Her *Autobiography of Margot Asquith* created a sensation in London and American society when it was first published in 1922. Her other books include *Persons and Places* (1925); *Lay Sermons* (1927); *Octavia* (1928); *More Memories* (1933); and *Off the Record* (1944).

PAINTING AND SCULPTURE. The year of the V-days which wrought vast changes in the economic fabric of America, had, except for isolated incidences, little effect on the wartime tonality of the art picture. The boom market in contemporary art patronage continued without pause, as more and more middle-class Americans entered the formerly elite circle of art collectors—product, primarily, of two main factors: namely, the end results of the intelligent, long-range program of cultural education, and the more material fact that people could not spend their money on radios and automobiles. Americans were beginning to discover aesthetic pleasure as compensation for mechanical conveniences. Although representing disconnected returns, two instances indicate this strong trend toward art ownership: the gross intake of the three leading art auction firms skyrocketed to \$11,408,652; Dan Lutz, noted romantic painter, entered 42 California collections without the benefit of a New York dealer.

As a fortunate corollary of this spreading appreciation, there were continuing signs of better craftsmanship and gains in painterly knowledge, marking a further departure from the fumbling technique and dreary color that contemporaries had come to think made them modern. Also on the assest side was waning subject-interest in Astoria slums and Midwestern silos. Judging from the large national exhibitions, American artists are returning, at least for weekend visits, to that ivory tower for inspiration along more purely aesthetic lines. All these trends were evident during the past two years; it is only that 1945 carried them forward. Those who saw the Whitney Museum exhibition of paintings by refugee artists from Europe appear to have taken the lesson seriously. Decadent in thought and empty of any real contact with life those paintings may have been, yet we must admit that the Europeans as a group are superior to us as a group when it comes to skill in putting paint on canvas. Ability to be articulate, in words or in paint, comes only through the process of hard work, and Americans, raised in a conveyor-belt envi-

ronment, too often think that personal emotions hastily expressed are enough to designate the artist.

As millions of young American fighters, having once again defended their country far from native soil, waited impatiently for ships, interest in war art, including the on-the-spot reports of United States combat artists and *Life* correspondents, dropped rapidly on the home front. It was First World War history repeating itself, leaving us with the bare hope that this desire to escape a bitter experience will not be carried too deeply into political thought, endangering international co-operation and the future of "One World." Many wonder what will eventually happen to the huge quantity of official art painted during the war. At year's end there were rumors that a National War Museum would be established in Washington, D.C., presenting visually the military history of the United States, housing paintings, photographs, newsreels, maps and actual weapons. Modern display techniques would help make this a fitting memorial to the dead of this war, and dramatize the lesson of the atomic bomb. At present, however, such a museum is not yet in the blueprint stage.

While it is true that more Americans are buying art today than at any time since the advent of modernism, it is also a fact that our changing economy and war-necessitated taxes, in some cases prohibitive, have largely eliminated the wealthy, leisure class, upon which art throughout the ages has relied for its main support. If fine art was to find an economic reason-for-being in an age of diminishing idealism—wherein emphasis has been switched from brain to brawn—then a new factor had to be discovered. It was at this stage that industry made its entrance as a powerful patron of the arts, some wisely and with dignity, others with the near-sighted policy of turning creative artists into amateur illustrators.

Most successful of these adventures of industry among the nation's fine artists is that of *Encyclopaedia Britannica*, which came to illustrate and remained to acquire one of the finest collections of contemporary American art. International Business Machines Company is continuing its program of sending art exhibitions as goodwill ambassadors to foreign lands. Standard Oil Company of New Jersey commissioned several noted artists to paint the vital role of oil during the war and has acquired some excellent pictures. The Upjohn Company bought existing easel paintings to illustrate its health messages and is now sending its art collection on tour. Pepsi-Cola conducts each year a competition to acquire paintings for its calendar and build an art collection; results have been valuable to both company and artists. Other industrial firms that have found mutual benefits through co-operation with fine artists are Container Corporation of America, Capehart, De Beers, and United States Brewers. There are two dangers to be avoided, if this alliance between industry and art is to develop its obvious potential—the artist must not "paint down" to his mass audience; the industrial leader, when he hires an artist, must permit that artist to function as an artist, not as an illustrator.

Despite wartime restrictions, several large and important exhibitions were arranged by museum directors during the year. The Rhode Island School of Design Museum, under Kenneth Washburn, staged a show of paintings of Old and New England, presenting to perfection

the art of our forefathers and their British contemporaries. Robert Feke and Ralph Earl emerged as strongest voices among our homespun ancestors, speaking to us in ringing tones of courage and individual enterprise. Also, as part of this trend toward reappreciation of early Americans, the Whitney and Worcester museums collaborated on an exhibition of Ralph Earl, colonial master, presenting a full view of his talents by including portraits and landscapes from three distinct periods—before, during, and after his trip to England. The Metropolitan Museum of New York held a comprehensive exhibition for William Sidney Mount, 19th century genre painter, arranged from the research of Bartlett Cowdray and William Warner Williams. Attention was drawn to the Hudson River school through an exhibition presented by the Art Institute of Chicago and the Whitney Museum of New York under the guidance of Frederick A. Sweet. Wrote C. J. Bulliet: "Here, in 164 pictures, was revealed in all its excellences, all its absurdities, the most important purely native art movement we have had, extending roughly from 1800 to 1875."

Among the tributes paid to individual contemporaries during the year, first place must go to the New York Museum of Modern Art's distinctive review of the passionate art of Georges Rouault, who at the age of 75, having survived the miseries of two wars, is still working with fresh, creative instincts. Margaret Breuning termed this notable show "a torrential impression, the pouring out through many years and in many forms of an intense, passionate nature." In Buffalo, the Albright Art Gallery opened the first comprehensive memorial exhibition of the work of Aristide Maillol, famous French sculptor killed in 1944 in an automobile accident. More than 100 works were assembled by Director Andrew C. Ritchie from public and private collections—indicative of Maillol's popularity on this side of the Atlantic. Stuart Davis, pioneer in the abstract idioms since the far-off days of the "Armory Show," was honored by the Museum of Modern Art with an impressive retrospective show. His creative goals over the course of 30 years—including *Eggbeater* and *Boogie Woogie* themes—were given pictorial recapitulation. The "Philadelphia Story," as illustrated by Philadelphia Press artists, William Clackens, George Luks, Everett Shinn, and John Sloan, was retold at the Philadelphia Museum.

On the occasion of its 75th birthday, the Salmagundi Club, stronghold of good craftsmanship and tradition, held an exhibition that broke precedents right and left. For the first time in Salmagundi history, 15 nonmembers were invited to exhibit. For the first time a nonmember jury of awards distributed three \$1,000 prizes, all to nonmembers—Jon Corbino for *Circus Aerialists*, Edward Hopper for *Office at Night*, and Reginald Marsh for *Holy Name Mission*.

The opening of a new, permanent installation of works of Greek art at the Metropolitan Museum was an event of importance. While we have long accepted the intellectual achievement of the Greeks, we have been inclined to take for granted their glory in the fields of plastic and pictorial art without examining it too closely, due mostly to monotonous museum presentation. The Metropolitan has now clarified the problem.

Perhaps the most controversial exhibition of the year came as a byproduct of the attempt of Halpern Associates to combine arts and antiques at New York's 17th Regiment Armory. Thirteen

art critics were each invited to select ten contemporary paintings and two sculptures. The art world, two months later, was still discussing their selections, mostly from the negative angle. However, 76,000 paid a dollar each to see the show.

Another exhibition that contended successfully with headlines heralding labor strikes and civil hatred was the second Pepsi-Cola competition, badly installed in the Mezzanine Gallery at Rockefeller Center, New York. The show, as a unit, was superior to last year's, but the prizes were of lower caliber. From 150 exhibits, dual-juried, Paul Burlin's poorly conceived painting of a *Soda Jerker* was awarded top honors and \$2,500. Second prize (\$2,000) went to Max Weber; third (\$1,500), to Gregorio Prestopino; fourth prize (\$1,000), to Mark Tobey; and fifth (\$750), to Zoltan Sepeshy. Fifteen \$500 awards went to the following: Ivan Le Lorraine Albright, Ilse Bischoff, Audrey Buller, David Burliuk, Fred Conway, Jon Corbino, Terence Duren, Carl Gaertner, Adams W. Garrett, Doris Kunzie, James Lechay, Julian Levi, Sgt. Oke Kordgren, Phil Paradise, and Lester Rondell.

The large national exhibitions continued their wartime course, remaining predominantly invitation affairs. As such, they maintained a high level of professional competence, but missed the thrilling element of new talent. Carnegie Institute, as usual, led the national field with its "Painting in the United States, 1945" exhibition—substitute since Pearl Harbor for the famed Carnegie Internationals. This year's show of 350 American paintings demonstrated the uncanny accuracy with which Acting Director John O'Connor, Jr., accorded true proportional representation to all the different kinds of painting that live side by side in our democracy (to paraphrase Jo Gibbs).. Coveted first prize of \$1,000 went to young, progressive Phillip Guston for *Sentimental Moment*. For his terrific indictment of war, called *Survivor*, George Grosz took second honors. Franklin C. Watkins placed third. Honorable mentions were voted to Samuel Rosenberg, Philip Evergood, Louis Guglielmi, and Julian Levi.

The overall trend of the Pennsylvania Academy's 140th annual was essentially more modern than has been the standard at the nation's oldest exhibition. Abraham Rattner's brilliant semiabstract *Kiosk* won the Temple Medal, while Stuart Davis's intellectual and fugue-like *Ultra Marine* composition took the Scheidt Prize, both honored members of the aesthetic left wing. Other winners were Sigmund Menkes, Henry Mattson, Eugene Speicher, Catherine Grant, Oronzio Maldarelli and José de Creeft (for his breathtakingly powerful head of Rachmaninoff).

The Corcoran Biennial, while being more right of center than the Pennsylvania Annual, yet gave a good cross section of our contemporaries. Here the jury awarded the Clark Prize of \$2,000 and the Corcoran Gold Medal to Reginald Marsh's *Strip Tease in New Jersey*, a typical example of this 20th century Rowlandson's probing brush. Second place went to Zsissley (Malvin Albright) for his repertorial *Deer Isle, Maine*. Isabel Bishop's *Two Girls Outdoors* was voted third honors, and Jean Liberté's highly romantic *Twin Lights, Rockport* placed fourth.

Critic C. J. Bulliet observed a persistent religious trend at the 56th Chicago Annual, indicating perhaps "a strong reaction against the crass materialism of our mechanized war, where the God the war-makers worshipped in fact if not

in spirit was the God of Napoleon—the God who fights on the side of the heaviest cannon." This reaction, however, did not dominate the prize canvases. Amid loud laments from the moderns, the jury awarded the \$750 Garrett Prize to Kenneth Hayes Miller's Bouguereauesque "*Reverie*." Edward Hopper's beautifully lighted *Hotel Lobby* took the famous Logan Award. Charles Sheeler and Yasuo Kuniyoshi were the Harris winners. Other winners were Paul Cadmus, Edward Laning, Eldizier Cortor, Grigory Gluckmann, Kay Sage, Raymond Breinin and Richard Bowman.

Once again no new museum construction took place, although in November, Director Francis Henry Taylor startled the art world by announcing ambitious plans for the renovation and expansion of the Metropolitan Museum. More than \$10,000,000 will be spent when postwar conditions permit. Also awaiting the green light are Frank Lloyd Wright's plans for the ultra-modern Museum of Non-Objective Painting, to be erected in New York at 89th Street and Fifth Avenue, just across the street from the National Academy.

Museum personnel underwent several changes. Dr. W. R. Valentiner, scholar, writer, and for 21 years director of the Detroit Institute of Arts, resigned and was succeeded by Edgar Preston Richardson, his assistant for more than a decade. Walter H. Siple, for 16 years director of the Cincinnati Museum, resigned his post. He was succeeded by Philip R. Adams, for 10 years head of the Columbus (Ohio) Gallery of Fine Arts.

Since it would prove nothing to list here all the museum acquisitions made in the fine arts during the year—unless it be that all types of art are now selling—it must suffice to mention a few of the highlights. The Rhode Island School of Design Museum acquired a notable Flemish panel by Hugo van der Goes, one of three Goes portraits in America. Another Rhode Island treasure is the beautiful Renoir, *The Young Shepherd*, painted when the artist was 70 and crippled by arthritis, but still the master of impressionism. Two important donations were made to the John Herron Art Institute in memory of Daniel W. and Elizabeth C. Marmon—Seurat's famous *Le Port de Gravelines* and Cézanne's *La Maison en Provence*. The Cincinnati Museum purchased a small but characteristically beautiful Monet painting, *Les Courses D'Auteuil*. The City Art Museum of St. Louis was enriched by Georges Braque's widely-exhibited *Blue Mandolin*. A pair of Robert Feke portraits, likenesses of Mr. and Mrs. Josiah Martin, after spending 199 years of obscurity together on Long Island, were separated—the former going to the Toledo Museum, and his devoted spouse to the Detroit Institute.

George Grey Barnard's notable collection of medieval and Renaissance art was purchased by the Philadelphia Museum, according to the sculptor's will which provides that the money go toward erecting his First World War memorial. Alfred H. Holbroog, New York lawyer, gave a collection of 100 paintings by 100 American artists to the University of Georgia. The Dallas Museum formulated an intelligent buying program, acquired paintings by Thomas Benton, Henry Varnum Poor, Gladys Rockmore Davis, George Grosz, Alexandre Hogue, Otis Dozier, among others, and William Zorach's sculpture, *Demeter*. Carnegie Institute purchased examples by Hobson Pittman, John Carroll, Benjamin Kopman and Nicolai Cikovsky. Whitney purchases,

always news, included oil paintings by Paul Burlin, Tully Filmus, Carl Gaertner, Walter Houmère, Abraham Rattner, Dorothy Varian, Karl Zerbe, Lee Jackson, Julio de Diego, Rico Le Brun, and Irene Rice Pereira.

Death was overly active in the American art world. N. C. Wyeth, patriarch of the Wyeth dynasty of painters, was killed in an automobile accident near Chadd's Ford, Pa., October 19, three days before his 63d birthday. Max Kalish, known for his sculptured portraits of workmen and world leaders, died in New York March 18, aged 54. Alexander Stirling Calder, sculptor whose monuments adorn public buildings and parks throughout the country, died January 6 in Brooklyn at the age of 74. The Metropolitan houses one of his best known figures, *The Man Cub*, a portrait of his son Sandy Calder, showing the now prominent modernist at the age of four. John F. Carlson, noted conservative landscape painter and pioneer settler of the Woodstock Art Colony, died March 20, aged 70. Frank Marsden London, well-known still life painter and distinguished designer of stained glass, passed away at his New York home March 17. He was 68.

Attilio Piccirilli, sculptor and head of the sculptural firm of Piccirilli Brothers, died in a New York hospital October 8, aged 79. His death followed by only two days that of his brother Gutulio, co-artist and business manager of the family organization. Four brothers survive. Death came to Vally Wieselthier, a leader of the modern school of ceramic art, September 1. She was 50. René Lahm, best known for her gay and effervescent watercolors, died in Tucson, Ariz., May 3. Orlando Rouland, noted portrait painter, died in New York June 26, aged 72. Guy Gayler Clark, dean of the Cooper Union Art School since 1938, died at the age of 62, the night of April 16. Among the art dealers to pass from the scene were Otto Torrington, partner of Hermann Wunderlich in the firm of Kennedy and Co.; Stephenson Scott, president of the 47-year-old art firm of Scott and Fowles; and Otto Bernet, co-founder and vice president of the Parke-Benet Galleries.

In closing the eventful year of 1945, it might be of interest to those who believe America sport-mad to review a few figures compiled by Paul Parker, director of the new Des Moines Art Center. In 1944 the Chicago Cubs baseball team had 640,710 paid customers; the Art Institute of Chicago drew 1,014,460; the Metropolitan Museum outdrew the New York Yankees by more than 400,000. Are people interested in art? Parker answered his own question: "*Time* magazine, hardly an eleemosynary outfit, seems to devote more lineage to art than to baseball—or to football, basketball and horse racing combined. Wouldn't you say that *Life* magazine devotes somewhat more picture space to art than to sports?"

PALAU, pä-lou', ISLANDS. See JAPANESE SOUTH SEA ISLANDS.

PALESTINE. A mandate of the League of Nations in the middle East bordering on the Mediterranean. It has been administered by the British government since the mandate came into effect on Sept. 29, 1923. The mandate for Palestine also includes Transjordan (q.v.), which

has an independent government, and to which some clauses of the mandate do not apply. Palestine, with an area of 10,429 square miles, had an estimated population on Dec. 31, 1943, of 1,676,571; of this total, 1,028,715 were Moslems, 502,912 Jews, 131,281 Christians, and 13,663 others. The estimated increase in population from the 1922 census till the end of 1943 was 924,523; among Moslems the estimated increase was 439,538, among Jews 419,122, and among Christians 59,817. Between April 1, 1939, and March 31, 1944, 51,186 Jewish immigrants, plus their wives and children, entered Palestine. During 1944 a total of nearly 15,000 Jewish immigrants entered the country, some 3,000 of them being children. Jerusalem (pop. 149,300 in 1943) is the capital, and other cities are Tel Aviv (148,100), Haifa (120,800), Jaffa (90,400), Gaza (29,300), Nablus (23,000), Hebron (22,400), Lydda (17,000), Nazareth (12,100), Tiberias (11,700), Acre (10,300); and Bethlehem (8,600).

Government.—Palestine is administered by a high commissioner (Lieut. Gen. Sir Alan Gordon Cunningham took office Nov. 21, 1945) who is assisted by nominated executive and advisory councils. For administrative purposes, the country is divided into six districts, each under a district commissioner; and local government in 24 municipalities is in the hands of elective councils. The official languages of the country are Arabic, Hebrew, and English.

The Jews have internal autonomy, cultural and communal; an Elected Assembly imposes taxes and license fees, and through the Va'ad Leumi (General Council) administers such matters as the educational system and health services and represents the community in its relations with the government. The Palestine and British governments recognize the Jewish Agency for Palestine as the medium in all matters pertaining to the upbuilding of the Jewish national home and the supervision of immigration. The Jewish Agency has established numerous bodies for carrying out economic constructive tasks; besides mortgage companies, these bodies include the Industrial Trust (with a paid-up capitalization of £200,000) and the Agricultural Trust (£150,000 capital). In 1945 the government and Jewish representatives combined to establish the Board for Scientific and Industrial Research.

Finances.—Expenditures for the fiscal year ended March 31, 1943, were £10,253,283, as compared with £7,463,602 for the preceding year, while revenues for 1942-43 amounted to £8,851,879, as compared with £8,325,553 in 1941-42. The outstanding external debt of the government on March 31, 1943, amounted to £3,600,000. Surplus balances on April 1, 1943, amounted to £3,935,348. The expenditure for 1944-45 was budgeted at £17,000,000, allocated as follows: £7,500,000 for normal services; £7,000,000 for extraordinary expenses, including the cost of living; and £2,500,000 earmarked for railroads and ports. Amended exchange control regulations which went into effect in December 1944 made it possible to transfer interest and capital payments on certain British and Palestine securities to people living outside the sterling area but not resident in Argentina, Canada, Newfoundland, or Switzerland. Similar transfers are permitted for funds hitherto blocked as belonging to foreign nationals who left Palestine for countries outside the sterling area; or belonging to certain categories of persons who technically are enemy

aliens and now live outside the sterling area. On April 26, 1945, an additional tax on the war profits of companies was imposed, and income taxes were raised for local companies and co-operative societies, and for international corporations doing business in Palestine; and on May 15 the government made an issue of bearer war loan bonds carrying an annual interest of one per cent.

Religion.—Jerusalem, the Holy City for Moslems, Jews, and Christians, is the seat of a number of prelates. A Moslem Supreme Council controls the religious affairs (including education) of that faith, and has responsibility for the *Wakfs* (charitable endowments) and for the Sharia courts concerned with matters of personal status. A Jewish Rabbinical Council, headed by two joint chief rabbis (one for the Sephardim, the other for the Ashkenazim), is the principal religious authority of that faith; religious courts responsible to that body have exclusive jurisdiction in certain matters of personal status, and jurisdiction by consent with regard to other nationals (except in matters of divorce). There are three Christian patriarchs—Orthodox, Latin, and Armenian; an apostolic delegate representing the Roman Catholic Church; bishops heading the Coptic and Syrian Orthodox communities; patriarchal vicars at the head of the Greek Catholic, Armenian Catholic, Syrian Catholic, and Maronite (Uniate) communities; an abbot leading the Ethiopian community; and a bishop responsible for the Anglican (Church of England) community.

Education.—There are separate schools, both government and private, for Moslems, Jews, and Christians; education is not compulsory, and it is not universal. In 1942–43, the schools, some providing vocational or secondary education in addition to elementary, were as follows:

Faith	Schools	Pupils
Moslem {government	403	58,325
{private	161	14,567
Jewish {government	488	66,317
{private	297	23,662
Christian (private	181	25,908
Total	1,530	188,779

There were also teacher-training colleges, technical, law, and agricultural schools, and at Jerusalem a Hebrew University (in 1943–44, 560 students attending schools of humanities and science); at Haifa, is the Hebrew Technical Institute (181 students in 1942–43).

Production.—The leading occupation of the people is agriculture, and principally the cultivation of citrus fruit and olives. In the early years of the war, lack of shipping seriously curtailed exports of oranges and grapefruits, but conditions improved in 1943–44 and citrus shipments set a record in the latter year. The British government agreed to purchase 5,000,000 cases of citrus fruit in 1945–46, as well as 100,000 tons of citrus (from which 5,000 tons of citrus concentrates would be produced). Olives, grown mainly for oil production, yielded 9,400 tons in 1942, and barley, 122,000 tons; other crops include durra, corn, potatoes, fresh fruit, legumes and other vegetables. Practically all vegetable seeds, formerly imported, are now grown in Palestine. Rice was grown for the first time in 1943, the yield being 400 tons. Livestock (1943) included 325,376 goats, 244,062 sheep, 242,945 cattle, 107,736 donkeys, 29,736 camels, 19,021 horses, 12,145 hogs, and 4,972 buffaloes. Gypsum of good quality is worked in Galilee, and rock salt in the valley of the Jordan and on the shores of the Dead

Sea; the Dead Sea also contains potash, magnesium chloride, common salt, sulphur, bromide, and carnallite. The manufacture of potash and bromine was increased considerably for war purposes, but the figure of production have been kept confidential. Crude petroleum is carried by pipeline across the Arabian desert to Haifa, where more than 3,500,000 tons are refined annually. The cutting and polishing of diamonds was established by the Jews as a new industry in 1938, and by 1945 32 factories were devoted to the enterprise. The largest paint factory in the Middle East is located at Kfar Atar, on Haifa Bay; this is the only plant in the British Empire, outside Britain, where "red dope," a special paint for aircraft, was manufactured. Newsprint, from scrap paper, is being made north of Tel Aviv, for the first time in the Middle East; and textiles made in Palestine, formerly imported from Europe, have secured markets as far east as India. Sponge fishing is a new industry, and there are numerous plants for the manufacture of foodstuffs, chemicals, and metal goods. The metric system of weights became standard for the whole of Palestine on July 1, 1944.

Foreign Trade.—Excluding petroleum products and Dead Sea chemicals, exports in 1942 had a value of £P3,061,828; they included wearing apparel, polished diamonds, chocolate, edible olive oil, citrus fruits, soap, sulphur, hides and skins, drugs and medicines, biscuits and cakes, and artificial teeth. Imports for consumption were valued at £P19,504,103; they comprised foodstuffs, precious stones, cotton yarn and piece goods, silk and artificial silk yarn, woollen tissues, motor vehicles, and rubber tires.

Communications.—Haifa is the principal port, and in 1944, Tel Aviv secured second place for volume of shipping; other ports are Jaffa, Gaza, and Acre. The railroad system of Palestine provides direct rail connection with Egypt, Transjordan and Syria; the three main sections of the system had a combined length of 328 miles in 1939, and during the war this was much extended. During the conflict, also, the 2,000 miles of highways were much improved and extended.

Principal Events in 1945.—Excavations conducted by the Jewish Palestine Exploration Society in 1945 brought to light several buildings at Beth Yerach, a town on the southwestern shore of the Sea of Galilee dating back to 2400 B.C.; much of the pottery discovered was of types common before the Christian era in Mediterranean countries outside Palestine. At Kuari Atta, near Haifa, the Palestine government's Department of Antiquities discovered in July 1945 a cave containing ossuaries, also of the pre-Christian era; together with the urns, each of which contained three or four skeletons, the excavators found much gold jewelry, and other art objects made of earthenware, ivory, and glass. Earlier finds on the site had been ascribed to the Canaanite, Hellenistic, Roman, and Byzantine periods.

But in most parts of the world the future status of Palestine was exciting more general interest than relics of its past. With defeat of Germany there remained in Europe hundreds of thousands of stateless, homeless Jews whose sole hope for survival lay in emigration, and in the vast majority they wished to go to Palestine. Great Britain, as the mandatory power, found herself on the horns of a dilemma, by the terms of the mandate being required to facilitate Jewish immigration while ensuring, at the same time,

that the rights and position of other sections of the population, predominantly Arab, were not thereby prejudiced. Discovery of a formula which would satisfy the legitimate aspirations of the Jews without infringement upon the established rights of the Arabs was a problem which, in 1945, preoccupied many minds in addition to those of the parties directly concerned.

The Palestinian Arabs, still in a great majority in the country, found staunch support in the newly established Arab League (q.v.) as well as in the member states individually. On March 10, 1945 (it was disclosed by the State Department on October 18), King Ibn Saud wrote to President Roosevelt denying the historical claims of the Jews to Palestine and declaring that formation of a Jewish state in that country would constitute a deadly blow to the Arabs; and in reply, on April 5 the president assured him that no decision would be taken "with respect to the basic situation" in Palestine "without full consultation with both Arabs and Jews." The Arab League, through its London office, demanded of British Prime Minister Clement R. Attlee in August complete stoppage of Jewish immigration and sale of land to Jews. The Arabs declared that Zionist claims received political support in the United States because of desire for the Jewish vote; that the Zionists were using the refugees as a cloak for their political designs in Palestine; and that American support of the Jewish "national home" was an "imperialist desire" to ensure an economic interest in the Middle East, mainly for petroleum, and the belief that a Jewish state, dependent on Anglo-American support, would be the agency for this imperialist policy. Secretary of State James F. Byrnes was also given the Arab point of view in a memorandum handed to him on October 12 by the legations of Egypt, Iraq, Lebanon, and Syria. Warning of "a great misunderstanding of the real issue in Palestine on the part of American public opinion," it stated that "to transform a country that has been non-Jewish for thousands of years, and Arab for 1,300 years, into a Jewish state is an act that obviously cannot be viewed with equanimity by the Arabs"; while the four states declared their readiness to help in solving the problem, "the Arabs [of Palestine] cannot be asked to sacrifice themselves." Maulana Abul Kalam Azad, the Moslem president of the All-India National Congress, declared in September that "Indian opinion is solidly behind the Arabs in Palestine, and we shall greatly resent it if President Truman's proposal [for the continued admission of Jews] is carried out." Both President Roosevelt and President Truman received letters on the Palestine problem from Emir Abdullah Ibn Husein, of Transjordan, who asserted, in October, that the Arabs must be consulted before a final decision was taken; and the Institute of Arab-American Affairs sent a like message to the president. In order that their case may be presented directly to world opinion, on November 22 the leaders of the six Arab parties in Palestine formed a 12-Higher Committee, a subcommittee of which immediately left for Cairo to confer with the Arab League.

The Jewish case for a national home in Palestine was also presented vigorously. In May the Jewish Agency laid before the British government a program which embraced: creation of a Jewish state; settlement of as many Jews as possible and development of Palestine's resources; an international loan and assistance in the transfer of 1,000,000 Jews to Palestine; a

reparations levy on Germany to aid in establishment of the Palestinian state; and international facilities for the exit and transit of all Jews wishing to settle in Palestine. In the United States, the Jewish demands received much support from congressmen. Senator Ralph O. Brewster, of Maine, and Representative Emanuel Celler, of New York, jointly sent a letter to President Truman on the eve of his departure for the Potsdam Conference urging his aid in opening Palestine to Jewish immigration and in securing the earliest transformation of that country into a free and democratic commonwealth, and a like stand was taken by the World Zionist Conference, which met in London in August; and on October 23 the American Zionist Emergency Council submitted to the State Department a memorandum calling for clarification of the policy of the United States with respect to Jewish claims. Not all Jews in the United States, however, viewed the problem alike. The American Council for Judaism, while advocating establishment of a democratic form of government in Palestine in which the citizens of all faiths may live together on terms of equality, opposed establishment of a Jewish nation, state, or political entity in Palestine and its nationalist symbols—a Jewish flag, a Jewish anthem, and a Jewish army. Unhappily, while the Arab and Jewish leaders were presenting their irreconcilable claims before the bar of public opinion, numerous outbreaks of violence occurred in both Palestine and neighboring Arab countries. Egyptians in Cairo and, to a lesser extent, in Alexandria rioted against Jewish-owned stores on November 1, 10 persons being killed and hundreds injured; in Tripoli, less than a week later, Jewish inhabitants were attacked by the Arabs, and before the rioting ceased 100 Jews had been killed; and Jewish terrorists in Palestine, who stole weapons on several occasions, precipitated their most serious riot of the year on November 14, fighting in Tel Aviv not ceasing until the troops opened fire.

The United States was vitally concerned in achieving a solution of the Arab-Jewish problem. Every president since Wilson has supported establishment of a Jewish commonwealth in Palestine; the proposal was endorsed by both major parties in the 1944 presidential election; and declarations supporting such a course were adopted in 1945 by both houses of Congress, by 40 state governors, and by the legislatures of 33 states of the Union. The United States government was undoubtedly hampered in pressing for fulfillment of these pledges to the Jews, however, by consideration of the economic and political factors involved, for should conflict with the Arabs ensue the important American petroleum interests in Saudi Arabia might be endangered, and there was a possibility that the Soviet Union might be prevailed upon to espouse the cause of the Arabs. In the summer of 1945, President Truman, who had repudiated the support he had given, as vice president, to proposals for a Palestine Jewish Commonwealth, urged upon Prime Minister Attlee the admission of 100,000 Jews to Palestine, though on October 18, Secretary of State Byrnes warned that final conclusions on proposals that would change the basic situation in that country would not be reached by his government without "full consultation with both Jewish and Arab leaders." Many congressmen were among the supporters of the American League for a Free Palestine, headed by former Senator Guy M. Gillette, which sponsored

an independent, democratic state; but a contrary position was taken by Senator Josiah W. Bailey, of North Carolina, who urged Secretary Byrnes "to keep this country out of the Palestine controversy." The situation in Palestine had grown so tense by October that United States troops were evacuated from the country and American equipment was removed to Egypt.

The British Labour Party, during its election campaign in the summer of 1945, had declared its readiness to support the Palestinian claims of the Jews, and after its return to office in July the Labour government was immediately subjected to pressure to implement its pledge. The request of President Truman on August 31 that 100,000 Jews be admitted to the country was not appreciated, being regarded as advice without responsibility, and it came at a time when the Arab League was insisting upon complete cessation of immigration. While only too anxious to devise some arrangement which would enable the Jews and Arabs to live together in peace, the British government of 1945, heir to the muddleheaded and opportunist policy during the First World War, realized that it could not solve the problem by itself and that international action, unprejudiced by interference from interested parties or individuals, had become essential. First steps to this end were announced after Prime Minister Attlee's visit to Washington, on Nov. 13, 1945, Foreign Secretary Ernest Bevin stating in the House of Commons that an agreement had been reached with the United States for setting up an Anglo-American Committee of Inquiry "to examine the question of European Jewry and to make a further review of the Palestine problem in the light of that examination." The terms of reference were embodied in notes exchanged between the two governments on December 10, and the membership of the 12-man committee was announced as follows: the United States members comprised Judge Joseph C. Hutcheson (of the Fifth Circuit Court, Houston, Texas), Frank Aydelotte (director of the Institute for Advanced Study, Princeton), Frank W. Buxton (editor of the *Boston Herald*), Max Gardner (former governor of North Carolina), James G. McDonald (former High Commissioner of Refugees for the League of Nations), and William Phillips (former ambassador to Italy); Great Britain was represented by Sir John E. Singleton (judge of the King's Bench Division of the High Court of Justice), Wilfred F. Crick (economic adviser to the Midland Bank), Richard H. S. Crossman (Labour member of Parliament), Sir Frederick W. Leggett (deputy secretary of the Ministry of Labour and National Service), Major Reginald E. Manningham-Buller (Conservative member of Parliament), and Lord Morrison of Tottenham (a Labour peer). Judge Hutcheson alternated with Sir John Singleton as chairman of the two-power group under a plan of rotation. The Committee of Inquiry, instructed to report within 120 days of beginning its work, opened hearings in Washington in January 1946, and, having concluded them on January 14, adjourned for further hearings to be conducted in London prior to departure for Palestine.

PALMYRA. An atoll in the North Pacific Ocean, 960 miles southwest of Hawaii, belonging to the United States. It is actually a group of some 50 islets, the largest of which is only six feet above sea level, forming three lagoons, and surrounded by a protecting coral reef. The total area is a little more than 46 acres. The island

was discovered Nov. 7, 1802, by Captain Sawle of the American vessel *Palmyra* and since then, until recently, apparently was visited only at rare intervals. According to the records found on the island by a Hawaiian commission in 1862, it was taken possession of for the United States by Dr. G. P. Judd, an agent of the American Guano Company, who visited it in the brig *Josephine* about 1859. In 1862 the Hawaiian government, apparently ignorant at that time of the fact that Dr. Judd had claimed the island for the United States, proclaimed it a Hawaiian possession. Commander Nichols of HMS *Cormorant* claimed the island, then uninhabited, for Great Britain in 1889, but when the United States annexed Hawaii in 1898, it was included with the rest of the group. It was not until 1936 that the United States thought it worth claiming formally by raising a flag there. In 1939 it was selected as the site for one of the new naval air bases to be established by the United States in the Pacific. The naval air station was commissioned in August 1941 and was bombed a few months later by the Japanese. It remained, however, under United States control.

PAN AMERICAN AFFAIRS. The termination of the war ushered in a period of transition for the American republics and brought with it problems of a political and economic character affecting the relations among themselves as well as with states in other parts of the world. Before the downfall of Germany and the surrender of Japan, every one of the American nations had declared war against one or both of the Axis powers, but the internal political situation in Argentina continued to have an unfavorable effect on the solidarity of the American republics and, during 1945, injected itself into the world picture.

At the beginning of the year there was still pending before the governing board of the Pan American Union the Argentine request for a meeting of foreign ministers "to consider the existing situation between the Argentine Republic and other American nations." Because of opposition to participating in a conference with a government which, at the time, had not been recognized by a majority of the other American states, the Inter-American Conference on Problems of War and Peace was convened at Mexico City from February 21 to March 8 without the participation of Argentina.

The Mexico City Conference.—Among the significant conclusions of the conference was the "Act of Chapultepec," a guarantee of the territorial integrity and the political independence and sovereignty of each state by all the other signatory states. It stipulates that an aggression against one shall be considered an attack upon all, whether committed by an American or a non-American state.

The Act of Chapultepec was to be a provisional instrument, to operate only for the duration of the war. To draw up a permanent treaty of reciprocal assistance, the government of Brazil invited the other governments of the American republics to meet in Rio de Janeiro on October 20 in an Inter-American Conference for the Maintenance of Continental Peace and Security. The United States, however, expressed its unwillingness to meet in conference with representatives of the existing Argentine government, and the governing board of the Pan American Union thereupon postponed the meeting until the spring of 1946.

The Mexico City Conference also adopted a

plan of reorganization of the inter-American system. One of the significant changes contemplated by this resolution is a provision that the governing board of the Pan American Union shall be composed of special representatives appointed by the governments, and specifically precludes the appointment of a member of the diplomatic mission accredited to Washington from serving in that capacity.

Although this proposal received a majority vote at Mexico City, it subsequently met with considerable opposition, partly because of a doubt as to the wisdom of the requirement, and partly because of the additional financial burden that such representation would entail. In the preparation of the program of the Rio de Janeiro Conference, therefore, the governing board of the Pan American Union agreed that the governments should further express their views on the matter, and that these views should be transmitted to the conference and to the governments for such action as might be deemed appropriate.

The Argentine question was also considered at Mexico City. As a result of a resolution expressing the hope that the Argentine government would identify itself with the common policy of the American nations and orient its policy so as to achieve its incorporation into the United Nations, Argentina declared war against Germany and Japan and subsequently signed the Final Act of the Mexico City Conference, following which, diplomatic relations were re-established. In October the situation again took a turn for the worse when the United States refused to participate with Argentina in the proposed Rio de Janeiro Conference to draw up a permanent treaty of mutual assistance.

San Francisco Conference.—The Argentine question also arose at the United Nations Conference in San Francisco, and after several sharp exchanges that aroused wide interest, Argentina was admitted to the conference. A more fundamental issue that presented itself at San Francisco, however, was the question of the relation of the inter-American system to the world organization. Among the Latin American delegations there was a strong desire for a maximum degree of autonomy in the settlement of disputes and the preservation of peace in the Western Hemisphere. The charter as finally adopted recognized the right of any group of states to enter into agreements for self-defense and to repel acts of aggression pending action by the Security Council, and placed upon regional agencies primary responsibility for the pacific settlement of disputes.

Economic Relations.—The termination of the war also brought with it serious questions of an economic character for most of the American republics. One of the important conclusions of the Mexico City Conference was an Economic Charter of the Americas, which set forth a series of principles and a number of objectives which the American republics would seek to achieve.

To implement and carry forward these principles and objectives, preparations were made for an Inter-American Economic Conference to meet at the Pan American Union on November 15, but because of an inability to complete the preparatory studies, the conference was postponed to April 1946.

Pending the convocation of the conference, the Inter-American Economic and Social Council was established and began to function at the Pan American Union in November. It is composed of representatives appointed by each of the 21 governments, and is entrusted with the study and

formulation of recommendations on economic and social problems affecting the welfare of the American republics. See also *INTER-AMERICAN AFFAIRS*; *WORLD POLITICS*.

WILLIAM MANGER,
Counselor, Pan American Union.

PANAMA. A republic in Central America, constituting the narrowest part of the isthmus between North and South America, with an area of 29,072 square miles, exclusive of the Canal Zone. It is bounded on the north by the Caribbean Sea, on the south by the Pacific Ocean, on the west by Costa Rica, and on the east by Colombia. The Caribbean coastline is 477 miles and the Pacific 767 miles. Panama's maximum width is 110 miles. The Canal Zone is a ten-mile strip across the country between Panama City and Colón which, with adjacent drainage areas but omitting the two cities, is under United States jurisdiction. Much of the republic is mountainous, though the elevation where the canal is cut through is only 285 feet. The 1940 census showed a population of 631,637 but a more recent estimate was 635,836. The largest city, the capital, is Panama City (1940 pop., 111,893); other important cities are Colón (44,393), and David (9,222). Racial estimates are 58 per cent mestizo, 17 per cent white, 15 per cent Negro, and 9 per cent Indian. Immigration, aside from that to the Canal Zone, has been limited but heterogeneous. Despite the prevalence of fevers, Panama was an important trading area during the Spanish colonial period. The province, after the collapse of the Spanish empire, remained attached to Colombia, although it attempted to win its independence in the 1840's. Independence finally came Nov. 3, 1903, as a result of the complicated canal politics of the time. Panama's original constitution (1904) was supplanted by a new one in December 1940, but this was suspended late in 1944 and a new constituent assembly met June 15, 1945, to frame another constitution.

Religion and Education.—Roman Catholicism is the predominant religion though Protestant denominations are strong in the Canal Zone. Education is nominally compulsory. Literacy, according to the 1940 census and excluding the Indian population, was 64.7 per cent. Most recent education statistics showed 670 primary schools with 74,039 pupils, 29 intermediate schools with 8,407 pupils, and one university with 857 enrolled. The university was originally the University of Panama but as a result of the action of the inter-American conference of Ministers of Education in 1943 was transformed into the Inter-American University; its financial support and attendance are still primarily Panamanian, however. The government in 1945 began a school construction program, aimed at erecting 400 buildings at a cost of \$3,000,000.

Communications.—Railways total 458 miles; the most important is the Panama Railroad (48 miles) connecting Panama City and Colón, owned and operated by the United States government and located in the Canal Zone. The Panamanian government operates a line of 124 miles and the United Fruit Company and a subsidiary have two lines totaling 286 miles. Passable roads total 1,090 miles, including 333 miles of pavement, 352 miles of improved earth, and 405 miles of unimproved road; 162 miles of new road were completed in the biennium 1943-44. Principal highways are the Inter-American Highway, under construction between Panama City and the Costa Rican border, and the Boyd-Roosevelt Highway between Panama City and Colón. The Inter-American

Highway is passable for only a few miles to the east of Panama City; difficult topography in the eastern part of the republic will probably indefinitely postpone its completion to Colombia. Four international airlines serve the republic; Pan American Airways now operates 56 weekly flights between Panama and Guatemala. One local airline operates and two others are being organized. Arriving and departing air passengers in 1944 totaled respectively 39,170 and 41,762. A new national airport, costing from \$5,000,000 to \$7,000,000, was expected to be completed by May, 1946. In 1939 shipping under the Panamanian flag totaled 718,000 tons but this increased considerably during the war because of transfers to Panamanian registry. Vehicle registration in 1943 (including the Canal Zone) was 16,091 passenger cars, 1,056 busses, and 1,585 trucks. Panama City and Colón in December 1944, had 8,360 telephones. The republic has 33 telegraph offices, 11 radio broadcasting stations and about 26,000 receiving sets, and a total of 134 postal stations.

Production.—Major economic activities are associated with transit of goods through the Canal. Aside from that, agriculture is the chief activity. In 1942 there were about 148,000 agricultural establishments and 227,330 acres under cultivation. Consumption crops include rice, corn, coffee, sugar, tobacco, beans, and tropical fruits, but of those only sugar and coffee are produced in self-sufficient quantities. Bananas and cacao are the traditionally important export crops although much emphasis has recently been put on production of abacá fiber as a wartime substitute for manila hemp. Abacá production in 1944 was 2,726 metric tons but was expected to be doubled within 18 months. Banana production is monopolized by the United Fruit Company which has an area of some 18,700 acres planted with an estimated 5,723,000 bearing trees. Rice production in 1944 was 1,016,680 quintals (quintal = 101.4 pounds) as against 1,356,892 quintals for 1942; no figures were available for 1943. Rubber production for 1944 was 312,402 kilograms. Coffee production for 1945 was estimated at 1,600 metric tons, about 50 per cent above 1944 production. Production of bananas, abacá, and rubber increased in 1944 over that of 1943, although cacao production was down. A comprehensive government agricultural program launched in 1945 was aimed at improving cattle breeds, importing more agricultural machinery, increasing irrigation, augmenting land distribution, and improving agricultural education. Of about a third of a million cattle not more than 10,000 to 13,000 produce milk. Chief forest products are balata, rubber, mahogany, and sarsaparilla. The Rubber Development Corporation began operations in Panama in October 1942, and since then has increased production by more than 13 times. Gold, platinum, copper, and salt, in that order, are the most valuable minerals, though mineral production is relatively unimportant. Industrial activity is limited and is mainly for local consumption; chief items are furniture, shoes, leather products, soap, straw hats, macaroni, building tiles, and liquors. The national brewery is the largest industrial enterprise in the republic. A cement factory, capitalized at \$1,500,000 was being organized in 1945. A large electrification program is also under study.

Finances.—The monetary unit is the balboa, equivalent to the U.S. dollar; the principal circulating medium is United States paper money and coin. There are no exchange controls. Total revenues for 1944 were \$27,198,000; expenditures

were \$25,039,600. The treasury balance Jan. 1, 1945, exceeded \$8,000,000. Largest sources of income were customs, internal revenue, and the national lottery, the three totaling more than 80 per cent of 1944 revenues. Chief percentage expenditures in 1944 were: health and public works, 39.7; government and justice, 17.2; education, 13. Private individual banking deposits Jan. 1, 1945, were \$66,099,708 as against \$52,993,669 a year earlier. Total bank assets March 31, 1945, were \$117,172,375 as against \$99,819,210 a year earlier.

Foreign Trade.—Total 1943 imports were \$40,268,000 (\$63.71 per capita); total 1943 exports were \$1,971,000 (\$3.12 per capita). Imports from the United States in 1943 were \$40,015,000 and exports to the United States \$1,457,000. Total imports in 1944 were \$38,000,000 (66 per cent from the United States) and total exports \$2,809,892. Exports in 1944 saw increases in bananas and abacá but a decrease in cocoa from 2,789 metric tons in 1943 to 1,455 tons. Rubber exports in 1944 were 348,720 kilograms, an increase of 12 per cent over 1943 exports. Cacao exports in 1944 were valued at \$263,428 as against \$402,460 in 1943. Exports in the first quarter of 1945 increased, chiefly due to larger abacá and banana shipments; abacá exports in that period were 897 metric tons against 339 tons in the first quarter of 1944; banana shipments totaled 441,559 stems (valued at \$351,514) as against none in the first quarter of 1944. Rubber exports in the first quarter of 1945 decreased to 208,276 pounds from 228,967 in the corresponding period of 1944.

Principal Events.—Political conditions were highly disturbed at the beginning of 1945. Provisional President Ricardo Adolfo de la Guardia was meeting an increasing amount of political opposition. Suspension of the constitution late in 1944 caused 14 congressmen to flee to the Canal Zone, where they were later joined by others in organizing a "government-in-exile" and choosing Jephtha B. Duncan as "first designate" to the presidency. Duncan on February 16 took an oath as "acting President" of Panama, claiming that de la Guardia had vacated the office by unconstitutional acts. In the meantime, de la Guardia had reorganized his cabinet and taken steps toward election of a constituent assembly to draft a new constitution. By March 9 the last of the rebellious assemblymen had either returned to Panama or flown to Costa Rica. Elections were held May 6 for the constituent assembly and two days later the government claimed a majority victory for its six-party coalition. The assembly met June 15, received de la Guardia's resignation as provisional president, and elected Enrique A. Jiménez, former ambassador to the United States, to succeed him. It then proceeded with the drafting of a constitution, basing its work on a preliminary draft published by a government commission in February. Ex-President Arnulfo Arias, exiled since the coup overthrowing him in 1941, still claimed from Buenos Aires to be the legal president, but was unable to return to Panama. Diplomatic relations with Spain were broken June 30.

RUSSELL H. FITZGIBBON,
Associate Professor, Political Science, University of California, Los Angeles.

PANAMA CANAL ZONE. A territorial possession of the United States, occupying a strip 10 miles wide across the Isthmus of Panama, with a total land and water area of 552.8 square miles (exclusive of the water area within the 3-mile

limit from the Atlantic and Pacific ends); total civilian population (census of June 30, 1941), 42,346, of which number 15,434 were Americans. Principal Canal Zone cities, with their 1940 populations exclusive of military personnel are Silver City, 4,583; La Boca, 4,035; Balboa, seat of administration, 3,922; Gatun, 2,477. No land in the zone is privately owned; it is, in effect, a government-owned reservation, given over to the operation, maintenance, and protection of the canal and its installations. In September 1939, the canal and the zone were placed under the control of the United States Army, and in January 1942, United States naval control was established over the Gulf of Panama and the maritime approaches to Cristobal, American town which is geographically almost one with the Panamanian city of Colón, but politically a separate city under United States jurisdiction. Colón and Panama City, which also adjoins the Canal Zone, have United States health and sanitation supervision.

Chief Canal Zone Officers, 1945.—Governor, Maj. Gen. J. C. Mehaffey, United States Army (appointed by the president of the United States to serve a four-year term ending in 1948; took the oath of office on May 16, 1944); engineer of maintenance (acts as governor during the governor's absence), Brig. Gen. Francis K. Newcomer, United States Army.

Judiciary.—The highest tribunal, the United States District Court for the District of the Canal Zone, is headed by Chief Justice Bunk Gardner; the Honorable Daniel E. McGrath is United States District Attorney.

Education.—Public elementary schools (last school year reported, 1943-44), 16; teachers, 122; pupils, 4,170; average yearly salary of elementary school teachers, \$1,779. Public junior high schools, 7; teachers, 62; students, 1,485. Public senior high schools, 2; teachers, 38; students, 834; average yearly salary of junior and senior high school teachers, \$2,100. Education courses are available for Negro students at La Boca Normal Training High School, which in 1943-44 had an enrollment of 65. The Canal Zone Junior College receives federal aid. Total federal appropriation for education and for the operation of public playgrounds for the fiscal year 1943-44, \$873,180. Superintendent of Schools, Ben M. Williams.

Finances.—The following figures were supplied by Arnold Bruckner, comptroller of the Panama Canal Zone:

Balance in treasury, beginning of fiscal year 1944-45	\$33,290,483.23
Receipts, 1944-45	55,757,666.44
Total	\$89,048,149.67
Disbursements, 1944-45	58,053,328.08
Balance, beginning of fiscal year 1945-46	\$30,994,821.59

PAPER PRODUCTION. The year 1945 was an eventful one in the paper and paperboard industry. Historically it should be divided into two equal parts. The first half was characterized by a great shortage of paper and paperboard extending through practically all grades, while beginning roughly with the end of June the shortages began to be eased. The turning point was the surrender of Germany, which eased the military situation and with it the military demands upon the industry. As a result of the surrender, the Skagerrak was opened and the first shipment of Swedish pulp arrived in the United States toward the end of June. As a result also of the defeat of Germany, the flow of munitions and supplies to the

European theater slowed. Thus the army was able to cut back its requirements of dissolving pulp for smokeless powder, freeing that pulp capacity to the production of paper grades of pulp. Other orders for supplies were cut back by the armed forces and the resulting diversion of paper to civilian uses was appreciable.

Probably the greatest relief, however, came from the opening up of the Scandinavian countries to the world markets. These countries before the war had, with Germany, been the greatest supply source of pulp and certain paper grades for England and Western Europe, not to mention South America and many Near Eastern and Far Eastern countries. With Germany and Scandinavia both blockaded after the spring of 1940, in order to maintain the war economy it had been necessary for this country and Canada to supply at least a minimum quantity of pulp and paper to those markets to which we had access. With Scandinavia back in the supply picture it would save both shipping space and available North American supplies if European markets were to return to their normal European supply sources. Exports of Canadian and United States pulp and paper to those markets were cut back thus permitting an increase in the current domestic supply in this country. The confusion which reigned in the economies of many countries has prevented any sudden shift, but the shifts are gradually developing and the movements are taking place at the present time (October 1).

The surrender of Japan in August came sooner than many had expected. It has tended to accelerate the readjustment to peacetime conditions. Many war contracts requiring packing materials and other papers have been canceled. Expenditure of munitions has practically stopped. Lend-lease has been canceled and exports have dropped. The armed forces are demobilizing and returning to civilian life thus returning the supply problem for these men and women to the normal civilian channels. The result is that with government demands decreasing, the pulp supply increasing, export and civilian demands resuming their more normal relationships, the WPB felt justified in revoking between August 21 and September 30 practically the entire wartime paper control system which had been so carefully built up.

The paper supply remained tight throughout the last three months of 1945. Manufacturing conditions felt the influence of the cataclysmic events of the past year. During the winter months storms greatly hindered production and transportation of pulpwood, the basic raw material for the industry. The waste paper drives were pushed, especially among school children who responded nobly to the wartime appeals. Collections were running at the rate of one million tons more annually than had been considered normal. With the surrender of Japan, the wartime appeal was dropped and the WPB Salvage Division was discontinued September 30. Many prisoners of war (mostly German) had been used effectively in cutting pulpwood but with the close of hostilities these are being returned home. In the South prisoners were responsible for producing about 35 per cent of the pulpwood, so that the problem of transition to free labor became one of major consequence to the industry.

The rather sudden transition from a condition of 25 per cent curtailment of consumption to a comparatively free supply and demand basis does not necessarily indicate that there is to be paper available for all demands. As the price factor is

still controlled in the supply and demand relationship, there is still a measure of production control exercised through the medium of price control. Thus the changes in supply are slow and demand still (October 1) remained heavily in excess of supply. Indications are that total production of paper and paperboard will not quite equal the record of 1941.

The war record of the paper industry is one of accomplishment in which the industry may well take pride. It has been officially commended by the War Production Board for its co-operation and for its accomplishments. The following production record is impressive:

	Pulpwood consumption (Thousand cords)	Wood pulp production (Short tons)	Paper and paperboard production (Short tons)
1938	9,194	5,933,560	11,380,814
1939	10,816	6,993,334	13,509,642
1940	13,743	8,959,559	14,483,709
1941	16,580	10,375,422	17,762,365
1942	17,275	10,783,430	17,083,862
1943	15,645	9,680,462	17,035,688
1944	16,754	10,108,443	17,182,804
1945 est.	16,900	10,150,000	17,320,000

LOUIS T. STEVENSON,
American Paper and Pulp Association.

PAPUA, Territory of. Administered by Australia, Papua has area of 90,540 square miles. It comprises the southeastern part of the island of New Guinea (87,786 square miles) and the Trobriand, Woodlark, D'Entrecasteaux and Louisiade groups of islands (2,754 square miles); the white population numbered (1941) 3,070, and natives were estimated to number 337,000. The capital is Port Moresby (white population of 800 in 1941). An administrator (H. L. Murray appointed Feb. 4, 1941) was assisted by executive and legislative councils, the members of which were officials and nominated unofficials. Revenue in 1941 amounted to £189,518, and expenditure to £189,297; an annual subsidy provided by the Australian government amounted to £42,500 for 1940-41. Japanese forces which invaded the country from North Eastern New Guinea (see NEW GUINEA, TERRITORY OF) early in 1942 were expelled by American and Australian troops before the year closed. The administrations of the Territory of New Guinea and Papua were amalgamated in 1945.

Of the 63,000 acres under cultivation in 1941, 44,583 were planted in coconuts and 18,262 acres in rubber. By 1944 the majority of the copra and rubber plantations either had been restored to their owners or were being operated by the New Guinea Production Control Board, which body was also active in the Territory of New Guinea. Whereas prewar rubber production in the two countries had averaged 1,200 tons a year, through intensive tapping, the record rubber yield of 1,621 tons was secured in 1944. Similarly copra produced at June 30, 1944, totaled 6,739 tons; on the basis of the area worked, this output compared more than favorably with peacetime production, when exports from the two reconquered Pacific territories averaged 80,000 tons per year. Other agricultural and forest products of Papua included bamboo, bananas, breadfruit, cacao, cotton, ginger, hemp, kapok, nutmeg, sago, spices, sugar, and vanilla. Gold is the principal mineral mined; the output in 1940-41 was valued at £133,341. Numerous other metals include copper, galena, cinnabar, graphite, sulphur, and lignite. Petroleum in marketable quantities has been located over a wide area. The indenture system of labor recruiting has been abandoned, and the rates of pay, feeding,

housing, and medical care of native laborers have been improved. Exports in 1940-41 (principally copra, gold, rubber, and dessicated coconut) were valued at £492,775, and imports amounted to £539,152. A road was constructed during 1943-44 to connect Port Moresby with Salamaua, in North Eastern New Guinea, and telephonic and telegraphic communications between those towns was later established. See also NEW GUINEA.

PARAGUAY. The second smallest in area and the smallest in population of the South American republics. It is one of the two land-locked South American countries, being entirely surrounded by Brazil, Argentina, and Bolivia. The Paraguay River, an affluent of the Paraná, divides the country into well recognized portions, Paraguay "proper" to the east, and the Paraguayan part of the Chaco Boreal to the west. The estimated area is 149,807 square miles of which 88,803 are in the Chaco and 61,004 east of the river. The northwestern boundary, dividing the Chaco region with Bolivia, was settled by treaty in October 1938. Population was officially estimated Jan. 1, 1944, at 1,108,040 of whom 1,056,139 were in eastern Paraguay and 51,901 in the Chaco. The principal concentration of population is along the rivers and in the area served by the railroad from Asunción to Encarnación. It is estimated that 97 per cent of the population is mestizo. Immigration, principally European, has been small but economically powerful since 1870; in recent years Polish immigrants have been most numerous. Foreign-born persons are estimated at about 50,000. Chief cities are the capital, Asunción (pop. est., Jan. 1, 1944, 126,280), Villarrica (30,176), Concepción (16,007), and Encarnación (15,610). It is estimated that 17 per cent of Paraguay's entire population lives within a radius of 20 miles of Asunción.

Paraguay was settled in 1535 by the Spanish and during most of the 16th century Asunción was a more important colonial settlement than Buenos Aires. The country became independent by a peaceful revolution in 1811 but soon fell under the strict dictatorship of Dr. José Francia. He was succeeded by two other dictators, Carlos Antonio López and Francisco Solano López, who ruled in succession until 1870. The population was almost wiped out by the disastrous war with Argentina, Brazil, and Uruguay from 1865 to 1870. Gen. Higinio Morinigo became provisional president on Sept. 8, 1940, following the death of President Estigarribia in an airplane accident. Morinigo's term was extended for five years by plebiscite of Feb. 15, 1943. The present constitution, dated July 10, 1940 (ratified August 4), provides for a directly-elected president with a five-year term, a unicameral congress elected on a population basis, and a judiciary headed by a supreme court; elections for the house of representatives have not been called since promulgation of the new constitution.

Religion and Education.—Roman Catholicism is the predominant faith, but freedom of worship prevails. The country has one archbishopric and two bishoprics. Education is free and theoretically compulsory but attendance is poorly enforced. The most recent education statistics showed 2,096 primary schools with 168,465 pupils, 24 intermediate schools with approximately 6,000 pupils, and one university with 1,108 enrolled.

Communications.—Paraguay has 305 miles of railway, in addition to several short, narrow-

gauge, privately owned lines. Annual traffic for the last five years has averaged 1,512,000 passengers and 321,000 tons of freight. The principal rail connection is from Asunción to Buenos Aires via Encarnación. Roads total 4,122 miles but of these only 375 miles are of gravel and 50 miles of macadam. Both Argentina and Brazil are now interested in the extension of rail and road arteries into Paraguay. One national and four foreign (Argentine, United States, and Brazilian) air lines operate. River transportation is important: the Paraguay River is usually navigable by ships of 12-foot draft to Asunción and by those of six-foot draft to Corumbá, Brazil; the Paraguay-Paraná system carries about 350,000 metric tons of freight annually. Vehicle registration in 1943 included 922 passenger cars, 313 busses, and 626 trucks. The country has 3,927 miles of telephone line with 3,905 subscribers. A total of 128 telegraph offices maintains 2,385 miles of line. There are 170 post offices.

Production.—The Chaco is composed of vast stretches of grassland, some timber areas, and extensive swamps. It produces the major part of Paraguay's important quebracho extract and some cattle and cotton. The eastern portion contains large heavily wooded sections and in addition to logging is important for yerba maté (Paraguayan tea), oranges, tobacco, cotton, and cattle. Corn, mandioca (manioc), and beef are staple food products, though large quantities of such foodstuffs as butter, flour, wheat, potatoes, and fruits are imported from Argentina. Weather and transportation difficulties appeared likely to limit 1945 cotton production to one crop instead of the usual two; heavy frosts in June 1945, seriously damaged all crops except wheat. Cotton, an important cash crop, totaled 46,500 metric tons in 1943-44 but would amount to only an estimated 27,000 metric tons in the following crop year. Sugar production, all consumed locally, usually amounts to 14,000 to 16,000 metric tons annually. The 1945 rice crop was expected to be slightly less than in 1944. Yerba maté production in 1944 was 16,657 metric tons as against 16,463 in 1943. A recent livestock census showed 2,729,000 cattle, 116,000 horses, 106,000 sheep, 21,700 hogs, and 3,500 goats. Hide and skin production usually averages almost 400,000 units annually. Cattle slaughtered in 1944 numbered 513,200. Chaco quebracho stands normally provide about 20 per cent of the world's natural tannin supply. Eastern Paraguay has enormous but little exploited stands of hardwoods. The bitter orange tree is a source of important quantities of petit-grain oil. Mineral deposits are known to exist but are undeveloped. Chief items of the small-scale industrial production are soft drinks, beer, ice, matches, textiles, shoes, leather goods, soap, oils, and processed tobacco.

Finances.—Depreciation of the former paper peso became so great (333 to the dollar in 1942-43) that a new unit, the guaraní, was instituted Nov. 8, 1943; its present value is about 32.4 cents. The government instituted important banking reforms early in 1945. Ordinary income in 1944 amounted to 20,500,000 guaranis and expenditures to G22,100,000; there was thus a deficit of G1,600,000, but expenditures of G2,200,000 on 1943 budget items approved, but not liquidated, raised the total deficit to G3,800,000. Two treasury bond issues were approved early in 1945 to finance the 1945 public works program and to repay budgetary deficits; they were respectively G2,400,000 and G3,000,000. Gold holdings of the Bank of Paraguay on June 30, 1945, were

G3,300,000; foreign exchange holdings on the same date, G27,000,000; bank obligations, G8,300,000; net reserves, G18,600,000; money in circulation, G28,600,000; total money issued, G44,300,000.

Foreign Trade.—Imports in 1944 were valued at G38,100,000 and exports at G42,300,000. This export excess of G4,200,000 (or 11 per cent) reversed the usual situation and was due to an increase of exports by 19 per cent over those of 1943, while 1944 imports increased only 3 per cent over 1943 imports. Imports in the first quarter of 1945 were valued at G13,556,000 and exports at G13,669,000. Trade for 1943 in dollars was: imports, \$11,784,000 (\$11.33 per capita); exports, \$11,331,000 (\$10.89 per capita). Imports from the United States in that year were \$1,885,000 and exports to the United States \$3,458,000. Most trade is with Argentina. Chief items of import, in order of value, are usually cotton and manufactures, foodstuffs, and metals and jewelry; chief exports by value are normally canned corned beef, quebracho extract, cotton fiber, and salted cattle hides. Importation of 80,000 head of Argentine cattle was expected in 1945.

Principal Events.—The government suspended for several days, beginning Jan. 3, 1945, all Paraguayan services of the Associated Press for alleged misquotation of a speech by President Morinigo; more stringent press regulations were put into effect January 12. Reports of a general strike circulated late in January, the president dissolved all labor unions February 21, and confused rumors of labor repression seeped out of Paraguay in June; all this seemed to add up to a continued dictatorship and strong influence by a reactionary military group. The government on Oct. 10, 1944, signed an important agreement with the Union Oil Company of California granting it exclusive exploratory rights in the Chaco Territory for ten years beginning Jan. 1, 1945, and requiring it to begin drilling within 18 months. Early in 1945 the government took steps to implement its agricultural program by decentralizing the technical services of the Office of Agriculture by establishing five new regional offices. The government by decree of Feb. 24, 1945, fell in line with contemporary changes in Argentina and Uruguay by changing vehicle operation from left-side to right-side driving. The Cabinet on February 7, in anticipation of the imminent inter-American conference at Mexico City, approved a declaration of war against the Axis powers. One week later Paraguay signed the United Nations pact. A decree of March 23 subjected enemy aliens to government regulation and on May 23 the important Banco Germánico was ordered into liquidation. On recommendation of the Committee for Political Defense (Montevideo), the government forbade Axis nationals to enter or leave the country. The government on June 28 seized the German legation archives for delivery to United Nations representatives and the following day ordered all German and Japanese nationals to register with the police. A state merchant marine, capitalized at G20,000,000, was established by decree June 27.

RUSSELL H. FITZGIBBON,
Associate Professor, Political Science, University of California, Los Angeles.

PARKS, National. See CANADA'S NATIONAL PARKS; NATIONAL PARK SERVICE.

PARTRIDGE, Sir Bernard, English cartoonist and illustrator: b. London, Oct. 11, 1861; d. there,

Aug. 9, 1945. Principal cartoonist of *Punch* since 1910, Sir Bernard was one of the world's foremost political cartoonists, depicting the stirring events of the world since the time of Queen Victoria. His work was conservative in form and exact and realistic in detail. The son of Richard Partridge, professor of anatomy to the Royal Academy, and nephew of John Partridge, portrait painter extraordinary to Queen Victoria, Sir Bernard attended Stonyhurst College and for a time was interested in the stage, appearing as Sergius in the first London production of George Bernard Shaw's *Arms and the Man*. From 1880 to 1884 he devoted himself to stained-glass designing and decorative painting, after which he began his press and book illustration work which he continued until his death. He joined the staff of *Punch* in 1891, and began doing political cartooning in 1910, continuing his work until the spring of 1945. He was knighted in 1925.

PATCH, Alexander McCarrell, Jr., United States Army officer: b. Fort Huachuca, Ariz., Nov. 23, 1889; d. San Antonio, Texas, Nov. 21, 1945. Lieutenant General Patch commanded the American Seventh Army for the final Allied assault on Nazi Europe, his troops, with those of French General Delattre de Tassigny, landing in invasion force on the French Mediterranean coast on Aug. 15, 1944. Said *Life* magazine of the American Seventh and its commander (shortly before Germany's capitulation), "Like all the rest of the armies, the Seventh reflects the characteristics of its leader. Patch, like Hodges (of the American First), is modest, scholarly, unspectacular. He is a classic specimen of the U.S. regular army officer. His army is a classic specimen of a standard, effective U.S. army." General Patch returned to the United States in July 1945 to command the United States Fourth Army, charged with preparing it for combat in the Pacific theater. On Oct. 8, 1945, the war against Japan at an end, General Patch was appointed to head a special board to study the army's postwar organization.

A West Point graduate (1913), General Patch fought in France with the 1st Infantry Division in the First World War. He held his first combat command of the Second World War in April 1942, when he led American troops co-operating with Free French forces in the occupation of New Caledonia. In December of that year, he commanded American army units landed on Guadalcanal to relieve Vandegrift's marines, and by early February 1943, had eliminated all Japanese resistance on that Pacific island. He left the Pacific theater in May 1943 to head the Fourth Army Corps at Fort Lewis, Washington, and in March 1944, assumed command of the Seventh. He was promoted lieutenant general (temporary) in August 1944, and held the Distinguished Service Medal for his contribution to the Guadalcanal campaign. His son, 24-year-old Capt. Alexander M. Patch, 3d, was killed in combat in France, Oct. 22, 1944. General Patch died of pneumonia, two days before his 56th birthday.

PATENTS. Renewal of interest and activity in the field of invention in the last year of the war was impressively indicated by a considerable increase in the number of applications filed and in the heavier demand for copies of patents. In the fiscal year ended June 30, 1945, there were received in the United States Patent Office 66,037 applications, compared with 54,165 in the preceding twelve months. This total exceeded that of any year since 1940. In the same fiscal period there were filed 18,623 applications for the first

registration and for the extension of trademarks, as against 14,403 in 1943-44.

There were issued in the 1944-45 fiscal year 30,535 patents, including 26 for plants; 3,552 for designs and 145 for reissues. This decrease of 1,248 was attributable to the rise in number of applications filed and to a shortage of technical help. On June 30, 1945, there were awaiting action 61,875 applications, that is, more than at the same date of any year since 1930.

Copies of patents sold in 1944-45 totaled 4,302,425. This was 101,590 more than in 1943-44 and 679,685 more than in 1942-43.

As an encouragement of the wider use of patented inventions in the post-war era there was established a register in the Patent Office for the use of those who wish to sell or license their patents to others.

In the fiscal year ended June 30, 1945, the receipts were \$4,128,122, an excess of \$381,587.23 over those in the preceding twelve months. Expenditures were \$5,041,186.58, compared to \$4,858,850.79 in 1943-44.

CASPAR W. OOMS,
Commissioner of Patents.

PATTEN, Gilbert George William, American author: b. Corinna, Me., Oct. 25, 1866; d. San Diego, Calif., Jan. 16, 1945. Writing under the pen name of Burt L. Standish, Mr. Patten was the creator of the fabulous Frank Merriwell—frank and merry in nature, well in body and mind—whose athletic prowess and amazing variety of other skills made him the hero of a generation of American boys. For 20 years Patten was one of the most popular and prolific authors in the world, writing an estimated 40,000,000 words in his lifetime.

Starting to write fiction at the age of 17, Patten worked briefly on a newspaper and contributed to juvenile monthly and weekly magazines. The idea for the Merriwell series originated with Ormond W. Smith, publisher of paper-back novels, who selected Patten to write a long series around the character of an athletic, adventurous schoolboy. The stories first appeared in 1896, and continued for 986 consecutive weeks until 1915. This series earned a fortune for Street and Smith, publishers of the *Tip Top Weekly* in which the stories appeared, but even at the height of his popularity, Patten, who always wrote on salary, earned only \$150 a week, and never received a cent of royalties. Besides his magazine output in the Merriwell series, Patten wrote 25 cloth-bound novels and 415 paper-covered books. The stories in all forms had a combined circulation of 137,000,000.

PATTERSON, Robert Porter, United States Cabinet official: b. Glen Falls, N.Y., Feb. 12, 1891. On Sept. 18, 1945, Mr. Patterson was designated secretary of war in the Truman Cabinet to succeed Henry L. Stimson. A former judge of the United States Circuit Court of Appeals for the Second Circuit, Mr. Patterson entered the War Department on July 31, 1940, as assistant secretary of war, and in December 1940, was named undersecretary of war, shortly after creation of that office. A graduate of Union College, Schenectady, and Harvard University, he was admitted to the New York bar in 1915, and with the exception of his army service, practiced law in New York City until 1930, when President Herbert Hoover appointed him a judge of the United States District Court, Southern New York District. As a private in the National Guard, Mr. Patterson served several months on the

Mexican border in 1916. In the First World War, he saw action overseas; held the rank of captain, later major; and received the Distinguished Service Cross, the Silver Star, and the Purple Heart. He also holds the Distinguished Service Medal, awarded him in September 1945 for his War Department service under Secretary of War Stimson. As undersecretary, Mr. Patterson supervised the army's \$100,000,000,000 procurement program. It is generally agreed that he handled the gigantic task with a high degree of success.

PATTON, George Smith, Jr., United States Army officer: b. San Gabriel, Calif., Nov. 11, 1885; d. Heidelberg, Germany, Dec. 21, 1945. Reputed to have been the wealthiest officer in the United States Army, General Patton was certainly its most colorful officer, its outstanding field commander, and, according to high German Army officers, the one they most feared. Well they might, for he defeated the Nazis every time he was pitted against them. He won his first major victory over them at El Guettar, North Africa, in March 1943; in July of that year he waded ashore from a landing barge to the beachhead at Gela, Sicily, to begin a campaign that, in his own words, "out-blitzed the inventors of Blitzkrieg." In just 38 days his Seventh Army and Gen. Sir Bernard L. Montgomery's British Eighth Army completed the conquest of Sicily. However, it was as the leader of the Third Army in a wild 10 months' dash from the Normandy beachhead across France, Belgium, Luxembourg, Germany, Czechoslovakia, and into Austria that established his fame as one of the most brilliant soldiers in American history. He has been accused of recklessness, of using unorthodox tactics, of taking uncalled-for chances. He was guilty on all three charges, but they paid off. He summarized his military creed in a talk to his men before the initial landing in Africa, when he said: "We shall attack and attack until we are exhausted, and then we shall attack again." That was Patton. His idea was to hit the enemy hard, then keep on hitting him, and when he was on the run to keep him running; never give him a chance to halt and reform. War, with him, was a game of chance, and he never hesitated to take chances. Furthermore he knew his men, and apparently he knew the weaknesses of the Germans. If he drove his own army mercilessly, he drove himself equally as hard. He had been one of the army's outstanding cavalymen, and he used cavalry tactics in driving his spearhead of tanks and armored cars across all sorts of terrain in a dash that has no parallel in all military history. There were times when he was traveling so fast that Supreme Headquarters would lose track of him. His advance units had to be supplied with gasoline, munitions and maps from the air so that they could keep going. In those ten months during which he fought his way across six European countries, the Third Army killed, wounded, or captured 1,811,388 Germans at a cost of 139,646 casualties.

It was inevitable that all sorts of myths should grow up around General Patton. Possessor of a lurid vocabulary, he was known by the nickname of "Old Blood and Guts," which he despised. Nevertheless, it stuck. Many of the tales told about him appear to have been figments of repertorial imagination, notably the one about his leaping ashore on the Normandy beach waving a \$1,000 bill and offering to bet that he would beat Field Marshal Montgomery into Berlin. Likewise the one about his swimming the icy Sauer
